The Dublin Builder.

Vol. I.—No. 1.

INTRODUCTORY.

UNLIKE the course usually pursued by intending journalists in the issuing of voluminous preliminary prospectuses—promising all manner of fine things—which not one in *one hundred* ever half read, *we* preferred to announce our purpose simply and briefly, leaving our adopted title to speak for itself, and reserving this space in our opening number for a few introductory remarks as to the circumstances which led us into this undertaking, and matters of detail connected with our proposed tactics. Justly may the numerous classes identified with the Building and Constructive arts in Ireland, writhe under the stigma that they alone of their craft in the three sister kingdoms pursue their career unrepresented by that powerful advocate, "the Press;" and are unable to point to any national and professional periodical devoted to their enlightenment, to the maintenance intact of their rights and privileges, and the forwarding of their general interests.* With a view of filling up the vacuum, our efforts, humble though they be, in the production of this journal, are directed; and zealously shall they be pursued, in the firm conviction that there are both the masses and the inclination in this country—if properly aroused—to support a class periodical conducted with prudence and ability. Sceptical as to the veracity of this some are, and we confess may to an extent justly be; but for obvious reasons *we* shall be pardoned for volunteering the statement, that "a previous undertaking of a similar nature fully justifies this trial." To dilate *here* upon subjects of a personal character, however they may bear upon the assertion just made, would be both bad taste and irrelevant; but for the satisfaction of those who formerly, and have again, entered the lists as our supporters; and to dispel from the minds of others a supposition as to the existence of chimerical elements in *this* speculation, we must remark, that were it not for a combination of proceedings, alike discreditable to the originators and unanticipated by us—but for which public contumely has been heaped upon their heads—the building profession and kindred arts and sciences would not have remained unrepresented during the last two years. With renewed vigour, though clothed in other garments and with different title, we enter upon our mission, but in principles remaining the same, with the introduction of some slight modifications. Though professedly a "class" journal, the projectors of "*The Dublin Builder*" confidently look forward to general support, by the introduction of instructive and popular subjects, and the entire absence from its pages of anything approximating to politics or polemics; they being solely devoted to the admission of such matter *only* as shall serve to enlighten the ignorant, to please and edify the man of education, and to chronicle advancing steps in the path of progress, when such appertain to projects or accomplishments of a scientific, artistic, sanitary, or, we may add, of a philanthropic character.

Pursuing such a course, we hope to find ourselves as welcome visitors in the studio and drawing-room of the professor, as in the humblest domicile of the intelligent mechanic; without being specially identified with either, but devoting ourselves equally, impartially, and independently to serve the interests and contribute to the gratification of both.

Reference to other portions of this journal will convince, that although Ireland has decidedly made improving strides in the several departments of a more immediately professional character, coming under our notice, much more yet remains to be achieved in the sanitary arrangements of our cities and towns, the water supply thereto, more complete ventilation of our public and domestic buildings, erection of national monuments, the demolition of dilapidated dwellings, provision of suitable homes for the living poor, and fitting receptacles for the remnants of mortality in all classes, &c.; presenting ample scope for another class of subjects strictly within *our* province, and which cannot fail to interest the philanthropist and every friend to the well-being of the community at large.

Owing to the absence of a local press devoted to the full and complete publication of matters scientific and artistic—periodically presenting themselves at the lectures and *conversaziones* of our institutes, so universally celebrated as instructing media—much valuable information which there might be imparted is denied to the working man, whose position in society and daily occupations respectively, preclude the possibility of personal attendance. True! the transactions of those institutions to which we refer are separately published and purchaseable, but they are either only gratuitously accessible to members, or are not compatible with the limited resources of an artizan's pocket. One of *our* chief objects shall be, as far as practicable within our moderate compass, to publish such proceedings so as to suit the comprehension of our readers, and not a mere unintelligible synopsis, omitting the gist and marrow of the subject, as is usually presented—seemingly under restraint—by most of our cotemporaries.

To our professional readers our course is so manifest as to call for little explanation, as substantially we shall follow in the wake of our predecessors, labouring, however, under the difficulties which constantly bestrew the path of novitiates, and with which they have had in their turn to contend as we now have.

They who recollect what those periodicals were at first starting, which are now colossal both in point of excellence and circulation, will readily admit that too much ought not to be expected *ab initio*, and that "all great ends are attained by small beginnings."

Such is the anomalous position of the Architectural and Engineering professions now-a-days, the former especially; and so utterly devoid are they of that governmental and legal protection of their rights invariably bestowed on every other, that much may be accomplished in the reformation of existing abuses by their exposition through the medium of a periodical devoted to special interests. Collectively, the members of these professions constitute an important class, and of themselves possess all the elements of strength to form a compact body capable of resisting extraneous shocks if the cohesive particles of "union and good faith" were not absent from the mass. To do justice, however, the Institute of Civil Engineers in Ireland has progressed in a degree towards the advancement of science, and deserves some credit, although considering the host of talent which it comprises within its area of membership, more could have been achieved. Let us, however, hope that a new era may dawn on the existence of this and a kindred institute which is painfully behindhand in fulfilling the object of its mission, though possessing advantages which, to some extent at least, might be turned to account. With much pleasure do we refer to the recent laudable effort made by the Builders of this city to establish an Association, with a view of improving the position of the body, and effecting a more permanent understanding between employer and employeés; and though in this latter respect some misconception has arisen, it is to be hoped that it will prove but a passing cloud, and that good feeling may be speedily restored. Little now remains for us to add, except as regards "*Illustrations*," to which all classes attach more or less interest. In this, however, we are reluctantly compelled to dissappoint general expectation, but we do so advisedly and—a moment's consideration will convince—wisely. To such a position of excellence, in this regard, have the professional and other periodicals now in existence at the other side attained, that we should be placed in a somewhat humiliated position were we to adopt a course which we could not creditably carry out; and in short with necessarily limited resources, *that* would be impracticable, at least during *the first year* of our existence; and if commenced in our infancy we should be both exposing ourselves to mockery and sealing our premature doom. We have an instance of a professional periodical published in Scotland *without* illustrations, and as "caution marks the guarded way" of speculators there, we adopt it as the safest means of ensuring ultimate success.

---

* In England there exist several first-class and well-established periodicals devoted to the improvement of science, art, and every branch of mechanics; presenting a never-failing source of instruction and mental recreation; and even Scotland, where the artizan class is neither so numerous nor so notedly excellent in skill and ingenuity as in Ireland, possesses one likewise, flourishing since the period of its establishment.

To those, however, who desire through our medium to publish their designs we say, that being desirous to afford every facility for the exposition of talent, we shall provide a space for meritorious subjects, the blocks—artistically executed—being supplied.

With those classes for whom this journal is sought to be established mainly depend both its longevity and excellence, for *we* but set the machinery at work, and it remains for *them* to assist in its maintenance, as the proceeding involves much responsibility.

Gladly would we have committed this task to abler hands, but none having stepped forward to assume the initiative, we now launch our bark, fully equipped for what we confidently look forward to be a long and prosperous voyage, trusting to be enabled by the assistance of an efficient crew to brave the uncertain sea of speculation, and steer it safely into the haven of prosperity.

THE BELL ROCK LIGHTHOUSE—the most remarkable erection on the shores of Great Britain, is a circular edifice, the foundation stone being nearly at low water level of ordinary spring-tides; and at high water the building is immersed fifteen feet. The two first courses of masonry are curiously dovetailed and jointed, and the successive layers are joggled. The cement used was a mixture of pozzolano, earth, lime, and sand in equal proportions. The stones weigh from one to two tons. The lower course is forty-two feet in diameter, and the building diminishes to thirteen feet. Total height, including the light room, 115 feet. It is solid to a height of thirty feet, then the walls are seven feet thick, but diminish to one foot. There are six flats interiorly, and the light room is of octagonal form covered with a dome of copper, and terminated by a gilt ball. Mr. Robert Stephenson, Engineer.

If we perceive at present little genius, it is because the arts have few inventors in an age where there are so many models.

ART UNION OF IRELAND.

AN association calculated, *par excellence*, to foster that artistic talent for which Ireland, amidst all her difficulties, has maintained a celebrity redounding to her national honour, is eminently entitled to co-operation from all classes; but more especially so where its initiative steps are beset with obstacles naturally resulting from the premature failure of some of its predecessors having similar objects in view, and professing at their onset to confer immense benefits on professional artists and the public at large respectively.

In the subject of our present notice we recognise elements at once embracing novelty, liberality, and judiciousness, and evidencing the fact of its promoters spurning the beaten path marked by former projects, and opening out a wider course both for the aspirations of artists and the cultivation of æsthetic principles in public taste. Matters of detail—the primary careful digestion of which serve to ensure the success of any design—seem to have been treated in this instance with peculiar foresight and study, so as to produce an harmonious whole, free from incongruous features and speculative reckonings.

"The Art Union of Ireland" has adopted rules for its guidance demanding special notice, and which to our mind will contribute materially to the permanency of its establishment; perhaps the most nationally important being the encouragement offered to artists, natives of, or resident in this country, in the appropriation of an annual sum, varying with its income, to be expended in premiums for the best works of art exhibited in the Royal Hibernian Academy; and the next, that of dispensing with the issue of engravings to each member from a single subject chosen by a committee. To the former we must, however, partly take an exception and suggest an amendment, viz., the dispensing of the Academy as the *exclusive* receptacle of premiated works, inasmuch as it shuts out from participation without considerable trouble, unnecessary expense, and some attendant dissatisfaction, several important provincial towns whereat we hope to see periodical Fine Art Exhibitions rather numerous, especially since the inducement of the travelling collection from Marlborough House is at the disposal of parties willing to avail themselves of its valuable accessary aid. For metropolitan purposes, the Royal Hibernian Academy is unquestionably the most fitting medium for the proposed object; but in a matter of national constitution, where success is so much dependent on general patronage, it seems to us that the principle of centralization ought to be prudently avoided as far as possible. Wisely, both in an artistic and pecuniary point of view, has the ordinary system of presenting *each* member with a proof engraving of a *chosen* subject been dispensed with, as the desirable objects are simultaneously attained of assisting the discriminations of small prize-holders entitled to select from a variety of works of art, whether pictures, engravings, statuettes, or casts; and of placing a larger sum to be expended in *chief* prizes at the disposal of the committee than was achievable under the old regimé. Doubtless, finely engraved fac-similes of the *chefs d'œuvres* of eminent artists extensively distributed materially conduce to the cultivation of a refined taste; but the selection is compulsory, and when thousands of thousands of similar impressions are struck off, and subsequently plagiarized and tortured into a variety of forms and materials. the excellence of art dwindles into a hackneyed vulgarism superlatively offensive and distasteful. Let us hope that before the committee finally decide on, and announce the premiums to be awarded to works of art exhibited in 1859, "Architecture" will not be forgotten, for in this department the exhibitions of the Academy have degenerated into a nothingness which no apparent cause can justify. For further particulars relative to this project, we must refer our readers to advertisements and the published prospectuses obtainable from the Secretary; and as the distribution of prizes is intended to take place in April, 1859, we trust that the important array of members collected against that occasion will stamp the operations of the "Art Union of Ireland" with the successful *impresse* which we heartily believe it deserves.

ACQUISITIONS TO THE BRITISH MUSEUM.—About 100 cases of antiquities, the result of excavations in Halicarnassus and Cnidus, have arrived in London, being transmitted thither by Mr Charles Newton, the British Vice-Consul at Mytilene; as also 50 cases of similar treasures from Carthage. Amongst those from Cnidus is a gigantic lion of Parian marble, in a crouching attitude, measuring ten feet in length, by six in height, and weighing eight tons.

CURRENT BUILDING, AND OTHER TOPICS.

Never, perhaps, since the days of James Gandon and Francis Johnston, to whose genius we are indebted for those designs which have rendered our buildings architecturally celebrated, was progress in the beautification of our metropolis and the improvement of its thoroughfares more manifest than at present. On all sides we hear of extensive works projected, and some of those for a length of time regarded as hearsay and mere idle rumour, have assumed a tangible shape, and are in course of completion.

Foremost we notice our Railway Companies contributing their quota, and taking steps to facilitate public conveyance and meet the requirements of increasing traffic by the extension of their lines, or the erection of additional buildings at their present termini. The Liffey branch, from the Broadstone terminus to the North Wall, is a project of much national importance, and a necessary consequence on the unprecedented success of the "Lever Transatlantic Line," to the spirited originator of which all honour is due. To those who have not inspected the map of this line—which has been prepared at the establishment of a fellow-citizen, and as a work of topographical skill and excellence, reflects on him the highest credit [*]—we may remark, that the line will branch by a curve near the terminal buildings, and run almost parallel with the north-easterly side of the Royal Canal, of which the Midland Great Western Railway Company are likewise the proprietors, to a point on North Wall Quay, beyond the last swivel-bridge. The bill will be brought before parliament in February; but lines of deviation being reserved at either side, it would be impossible, in the present stage of proceedings, to define the exact route. It may not be generally known that at the Galway end of this railway a branch is in actual course of construction, from Eyre-square terminus to the docks, thereby ensuring direct railway communication from our quays to the pier whence the trans-Atlantic vessels start. The costly and beautifully executed terminal buildings of this company have, to a great extent, been hidden from public view, owing to the extremely narrow approach thereto by Upper Dominick-street; but this defect is in course of being obviated by the construction of a new street from the Broadstone to the Four Courts *via* portion of Church-street, near to the wing now being erected by Mr. Meade, under the Board of Public Works. Some deviations, however, have been made from the original plan, and the project is likely to be more comprehensive than was at first intended. While in this locality, we direct our footsteps towards the new bridge, destined to supply the place of that time-honoured, but dilapidated, structure familiarly known as "Bloody Bridge." Considerable progress has been made; and the river will be spanned by a single arch resting against chiselled granite abutments, and with cast iron openwork parapets, &c., the design having some architectural merit combined with simplicity and appropriateness. To the Ballast Corporation, and the skill of the engineer, Mr. George Halpin, are the citizens indebted for this decided improvement, as also for the recently erected and beautiful graving dock near the North Wall point, and the two timber wharves in course of erection near Wapping and Fish-streets.

Perhaps the project which commands the greatest share of public attention is the contemplated street, the continuation of Dame-street—to the terminus of the Great Southern and Western Railway, at King's Bridge; and though many doubt its feasibility, we are assured that it is in a fairer way of speedy accomplishment than is generally believed, and that several influential noblemen and gentlemen have taken it up in right earnest, and doubtless will carry it through; so that we may look forward to its completion before many more summers shall have passed over our heads. To save misunderstanding, however, it is well to state, that the parties identified with this undertaking are an independent body, having no connection collectively with our local Corporation, which is unquestionably an advantage rather than otherwise. The roadway will be 60 feet, with pathways at either side of 20 feet, making a total of 100 feet. The metamorphis which will be effected in the various localities through which it is proposed to pass, is palpable; and narrow and crooked streets, with their ruinous and confined dwellings will be razed, and give place to a wide thoroughfare with ranges of first-class commercial establishments at either side. This, at least, is the project; and we doubt not that if carried out at all, it will be in its entirety; and that intending builders will be bound substantially to a plan, so as to ensure uniformity.

We should mention that the designer of this great scheme is Mr. Louch, a local architect and C.E., to whom the citizens have already been under obligations for metropolitan improvements, the result of his valuable suggestions.

Again, in the neighbourhood of Amiens-street, important works are proposed to be carried out by the Dublin and Drogheda Railway Company, in the widening of their present line at the terminus; and the area comprehended by this proposal will embrace many of the ranges of dwellings parallel to, and at right angles, or nearly so, with the railway, which must *de necessitate* be removed, including Halpin's-row, Inkerman, portion of Preston-street, &c., as also the waste ground both in front and rere; and which, when effected, will cause a great and desirable change. The inclined approach for goods to the railway will be opposite to the quoin of terminus at the other side of the roadway, leading to Sheriff-street, and for some distance will run parallel to Amiens-street, curving towards the line. In the immediate vicinity, buildings of a domestic class have sprung up rather more rapidly of late years than might have been anticipated from the nature of the site, which not very long since was regarded as an almost irreclaimable swamp; and we know that many others are now in contemplation, which fully evidence that the north side is manifestly improving, and land formerly pronounced valueless, to be capable of reproduction to the owners. Passing to the south side we find the same steady march in the path of improvement which has so long characterized Rathmines, Rathgar, Roundtown, &c., where villas, single and semi-detached, terraces, &c., are springing up with an almost fairy-like rapidity, and the green sward speedily gives way to macadamized roads and populous thoroughfares, justifying the supposition that there is a universal move in that direction. We hear of a new religious edifice being intended, but do not countenance, as a general principle, the spirit which guides professional gentlemen to tender their services gratuitously, as in the first place it damages the interests of others, and is rarely prompted by any other feeling than that of gratifying vanity.

---

[*] Mr. E. J. Harty, Lithographer, &c., Ulster Chambers, Dame-st.

At length we are pleased to find that a committee has been formed with a view of carrying into effect the suggestion of Lord Carlisle, happily thrown out at the inauguration of the Moore Statue, viz., to erect a suitable monument to our late distinguished countryman, "Oliver Goldsmith." Suitable let us hope it may be, or not at all! for all but the perpetrators must look with pain on the sorry production—contiguous to that proposed—assumed to be in honourable commemoration of Ireland's bard, Thomas Moore! Doctor it as they may, it must still remain a perpetual stigma on our artistic taste and national pride; and the only true remedy is a complete and speedy removal, followed by the substitution of a memorial more consistent with good taste, and better in accordance with the *personnel* of the bard; as also the provision of a fitting pedestal for the reception of his well-known diminutive but portly form, rather than the colossal proportions of the broad-backed and brawny figure now resting on the gaunt pedestal in College-street. We understand it has been finally resolved to take off the present prodigious and stooped head, substituting one looking upwards as more consistent with presumed inspiration. Unfortunately, in most of our projects in this country, merit, *modest* merit, is cast in the shade, and designs by struggling artists, however meritorious, must yield to the protegés of influential parties; and never was a case more palpable than this for the distinguished sculptor who has since passed from amongst us, and who submitted a beautiful—and his *last*—model for this statue, at once simple, graceful and truthful (as all his works were), was disregarded, and the execution of the memorial entrusted to another who, whatever may be his talents, had not the national claims of "John Hogan," and certainly did not, in this instance, produce a successful result. Let the errors of the past, however, be avoided; and let the proposed Goldsmith Testimonial be thrown open to a real national competition, and three or four competent artists, selected by the Board of Trinity College, be called in to adjudicate on the designs submitted, when prepared to carry out the one approved without any aftercomings. The recent negociations between the College authorities and the Corporation, with reference to lessening the enclosed area in front, having terminated without effecting the desired end, it behoves the enlightened Board of the venerated Alma Mater to reconsider, under existing circumstances, the details of an arrangement, whereby the double advantage of providing a fitting position for the memorial to him whose career was so intimately identified with the University, and the removal of present impediments to public traffic be attained; not to speak of the improvement which would consequently ensue, architecturally speaking, to the buildings themselves. Close by, and at either side of the University boundary, we hear of new and important structures about being raised; one, a new bank for the Provincial Banking Company, on the site of the Irish Institution, and adjoining houses in College-street, a position peculiarly adapted for the purpose; and the other an extensive club-house, for the Kildare-street Club, which will necessitate the removal of a block of houses in Leinster-street, at its junction with Kildare-street. This building, we understand, will be after the Pall Mall type, on a scale superior to anything yet achieved in Ireland; Messrs. Deane and Woodward, architects, who we doubt not will sustain the high artistic excellence of that firm, and produce a design which may be regarded as an acquisition to the city. We shall at an early period take the opportunity of again alluding to this, as to details of arrangement, &c.

After sundry alterations and deliberations, practically initiative steps towards the erection of the National Gallery for Ireland have been taken, and workmen, under the direction of Messrs. Cockburn and Son, builders, are now busily employed in Leinster Lawn. Externally, the structure will and must, as a consequence, correspond architecturally with the existing Museum; but, internally, the plan will be different; and we sincerely trust the palpable errors of the other, both as regards arrangement and *ventilation*, will be avoided. Enough, however, for our present purpose; we shall again revert to the subject as occasion may require.

Buildings for Public Speaking.—Anything that tends to prevent the voice from being dissipated in the upper parts of a building, must be advantageous to the speaker; hence *sound-boards* are placed over chairs and pulpits. But these ought not to be such as to concentrate the sound in certain points, because it follows on principle that the more we strengthen sound in these points by reflection, the more we diminish its effect in others. The parabolic sound-board is the best, since the parabola has the property of reflecting all the rays of sound which emerge from its focus. The elliptical form of building is undoubtedly the best when we desire that the sound emitted from one focus should converge to another. The nature of the walls and floor is important. If the walls have many openings, the sound will be absorbed, and the voice will not be so effective where there are so many recesses. If there are vaults, &c., under the floor, the space between the latter and the arches should be filled in with sawdust or some other substance to prevent vibration.

A RAMBLE IN OUR CEMETERIES.

Dr. Blair, in his immortal elegy on that certain receptacle of all mortality, "*The Grave*," thus writes:—

> "When self-esteem or others' adulation,
> Would cunningly persuade us we are something
> Above the common level of our kind;
> "*The Grave*" gainsays the smooth-complexioned flattery,
> And with blunt truth acquaints us what we are."

And so it is; when contemplatively inclined, a stroll in our churchyards and cemeteries is, perhaps, the best medium of awakening us to a sense, that while nature dies, and generation after generation passes away, the fruit of man's conception, "art," survives him, and leaves to posterity substantial memorials of his genius and labours. In such a mood, though—acknowledging with blushing candour—perhaps more influenced by love of the artistic than indulging in aspirations of a loftier spirit, our footsteps recently were bent respectively to the cemeteries at Golden Bridge, Glasnevin, and Harold's-Cross; the former situated in the parish of St. James, and adjoining the second lock on the Grand Canal; the second in a north-eastern suburb about two miles from Dublin, and the latter in a south-westerly direction, three miles from the General Post-Office.

Autumn and winter, though each other season likewise brings its own contemplations in such a locality, furnish elements of a corresponding character; and perhaps more suggestive of the withering influences which death lavishly disseminates, equalizing man with the objects of his toil, dear to him while living, but destined in their annual turn to strew his grave with the decayed relics of their verdant beauty.

Before entering upon our more immediate purpose, we subjoin a few particulars relative to the origin and statistics of these establishments, and we shall not fail to notice as we progress, for the gratification of the general reader, the historic and other features of the locality in which they are situated. We may mention that the first extramural burying-ground was that of St. George's, adjoining the Royal Canal, and opened in 1829; also that there is a Jewish cemetery, occupying a quarter of an acre, at Ballybough Bridge, said to have been contemporaneous with Oliver Cromwell.

The cemetery at Golden Bridge was established in 1827, in consequence of an order issued by the late Archbishop of Dublin, Dr. Magee, "that the burial service in any of the churchyards within his jurisdiction should not be read by a Roman Catholic clergyman," and for the expenses attendant thereon the Catholic Association granted £1000. This cemetery, comprising only two Irish acres, was rapidly filled, containing 22,683 bodies, and the Committee of Management subsequently became possessors, for a like purpose, of the ground adjoining the Botanic Gardens at Glasnevin, which was opened as a cemetery in February, 1832, being only nine acres in extent, but enlarged twice until it was extended to 40 acres. The funds arising from the two cemeteries, after paying the necessary expenses, were devoted to the liquidation of the fines, the ground independently being taken at 10 guineas per acre, which to a considerable extent have been paid off; and the committee have given large sums for the purpose of educating the poor—on two occasions upwards of £500 each. The original committee of management was appointed by the Catholic Association, but when a vacancy occurs new members are elected. The number of interments that have taken place in this cemetery since the commencement are—

In the general ground	...	105,914
In the poor ground	...	51,173
Total,		157,087

The poor are buried for 1s. 6d. each!

The Committee for many years gave their services gratuitously but are now paid half-a-guinea for each attendance, amounting in the aggregate to about £100 per annum on the Association.

In point of *locale* and internal arrangement, this cemetery is beautiful, occupying an extensive level area, in a picturesque village, with the meandering Tolka running close by; surrounded by high enclosure walls, with castellated watch-towers at the angles, and bounded by the Botanic Gardens and the high road respectively; most tastefully laid out in plots distinguished by letters, ornamented with shrubs, and approached by spacious and carefully gravelled pathways, with suitable fences at either side. The entrance is simple and appropriate, consisting of a graceful and lofty central arched gateway, surmounted by an entablature, and terminated by the emblem of Christianity; with a curvilinear dwarf wall of chiselled stone supporting an iron railing branching therefrom, and forming a wide area for the turning of vehicles.

Here, in the forenoon of each day, may be seen "the well-plumed hearse come nodding on, attended by the sable tribe" who mournfully convey age and youth alike to the last resting-place of all mankind! Happily, with increasing civilization, the revolting and semi-barbarous scenes which heretofore took place at funerals in this country have gradually become but matters of history, which, for the sake of humanity, 'twere better ever to bury in oblivion; and, on enquiry, we find that now, with very few exceptions, the utmost decorum is observed by all classes, even to the humblest—a fact we voluntarily digress to chronicle, as serving to dispel prejudice from the minds of strangers who judge of our country, on the magnified representations of authors—injudiciously encouraged by ourselves—and which but serve to perpetuate ill feeling and contempt for our national character.

A Roman Catholic chaplain attends daily to recite the burial-service, and the committee, until very recently, had a Protestant chaplain engaged, but, in consequence of the few members of that persuasion interred there, discontinued him. There is a Protestant gentleman on the committee.

The monuments are generally of the usual promiscuous character in point of design, but some very beautiful and tasteful structures nevertheless are to be found in this cemetery. That to which greatest interest is attached is unquestionably O'Connell's, which being in the form of a round tower, after ancient models, and beautifully executed in granite ashler, rears its conical head to a height of 170 feet; and visible to the surrounding country for many miles, marks the spot where are destined to repose the remains of him whom *all* acknowledge to have been "a great man," and which are still in the vault where originally placed after the funeral, having been brought over by the Cemetery Committee, from Genoa, at a cost of £1,200. Underneath the round tower are spacious vaults and a mortuary chapel, and the structure forms the centre of a circle approached by bridges over a *fosse*.

There is a spacious chapel, in which divine service is performed, ornamented with fine paintings, and in the Doric style, after a design by Mr. Patrick Byrne, architect. Eight new vaults have been added, at a cost of about £200—Mr. Beardwood, builder.

In proximity with the entrance is the tomb of another great national boast, John Philpot Curran, whose wit and eloquence have created for him a memorial more perpetual than the massive stonework which covers his remains.

Its superintendence to completion was entrusted to the late Mr. Papworth, architect, who adopted as his model the monument erected at Rome to Scipio Barbatius, and faithfully imitated its classic outline and details. The Association in this instance likewise paid the expenses of bringing over Curran's remains from Paddington, and the erection of the monument was raised by voluntary subscription. Amongst the remarkable persons whose remains repose here likewise we may mention the names of Mr. Ruthven, late M.P. for Dublin, to whom a monument was erected by subscription; Tom Steele, the *fides Achates* of O'Connell; Sir Simon Bradstreet, and John O'Connell. Monuments of an important class distinguish the family vaults of Sir Timothy O'Brien, Chief Justice Monahan, Messrs. Martin, the Misses Lalor, &c.

The Committee offered to bring over the remains of Thomas Moore, and provide a fitting receptacle for them in the cemetery; but the offer was declined by his widow, with warm expressions of gratitude, as also was a similar one made to the family of the late Richard Lalor Sheil.

The ingenious manner of marking the grounds by letters and figures is due to M. J. O'Kelly, Esq. (one of the gentlemen appointed by the Catholic Association as a member of the committee, and now Secretary), a means by which, on reference to the registry, any individual of the thousands there interred can be immediately found.

Next to Pere la Chaise in Paris, Prospect Cemetery at Glasnevin is, perhaps, the most beautiful we have visited, though the comparison may be slightly inconsistent, owing to the different nature of their respective sites—the one being elevated and hilly, the other lying somewhat low and occupying an extensive level surface; but we must remark that we notice in this latter the recent introduction of chapel tombs over the graves, and the yellow wreath decorations so abundant in the former. For the present, however, to save censure for tediousness, we discontinue our notice, with a view of resuming in our next, as regards the cemeteries at the south side.

A FEW PRACTICAL HINTS ON THE VENTILATION OF BUILDINGS.

DOORS and windows ought not to be taken into consideration in connection with the ventilation of buildings; they are provided for facility of ingress and egress to and within the building, and for admitting light to the several apartments, and cannot be applied to promote ventilation in the seasons and under the circumstances which make ventilation most highly desirable. It is not enough to set a window or door open to admit fresh air into an otherwise unventilated apartment, even when windows and doors can be properly set open. The air must be drawn or pressed in, and in either case there must be a way of escape for what the apartment had previously contained; and as two opposite currents of the same kind of fluid can hardly pass one another in the same orifice, the ventilation of an apartment—that is, the establishment of a current of air through it—can only be properly effected by the establishment of opposite currents through different orifices. In this manner it will be found that a fireplace with an open flue from it leading to the outer air will act in concert with an open window; by allowing an up draught to be fed by the window, or by permitting a down draught, according to the state of the atmosphere and the direction of any currents of wind; or as there may or may not be a fire in the chimney or heat affecting its flue from fire in another chimney. Open windows are seldom consistent with fires as sources of warmth, and the common domestic focal fire may not therefore be relied upon as a means of ventilating an apartment in connection with open windows. One-third of the life of civilized man is passed in apartments within buildings under circumstances which for the most part preclude open windows and render fires either inconvenient or unnecessary as a source of warmth. One-third of the lives of three-fourths of the people of England is passed in rooms which have no chimney at all, or of which the chimney opening has a board before it; and of which the doors and windows are all shut as closely as the occupiers can shut them. In the cases of the few who may indulge in bedroom fires in the winter, or of those who will open a bedchamber window an inch or two in the summer, the former allow the fire to divide with them the pent-up air of the apartment; and the latter shut down the registrar flap or put up the chimney board to prevent the circulation which the state of the atmosphere or of the wind might bring about. Air is an inert body, and will not move either in or out of any apartment unless something be done to induce movement; but it yields ready obedience to any action that does not seek to compress it, and responds freely to any endeavour to draw it.

ORIGIN, HISTORY, AND NATURE OF LITHOGRAPHY.

LIKE every other new invention when first brought into notice, this met with all the obstacles which ignorance and prejudice could throw in its way, and it was not until after years of laborious perseverance, accompanied with the difficulty of limited means that the inventor, Senefelder, established his reputation and gained for the new art its due degree of admiration. His inability to meet the printing expenses of his works, suggested the thought of devising some cheaper mode of publication. With this view his intention was first directed to several original and curious modes of stereotype, which, however, his circumstances prevented his maturing. He first experimentalised on metal and composition blocks, and then on plates of copper and tin; also with an etching needle and chemical inks, but found they possessed all the objections found in the stereotyping plan. Experiments on stone slabs followed in rapid succession, and he was pleased to find that he was enabled to take numerous impressions from the original. From this period the art has increased wonderfully and attained a great excellence. Lithography differs from printing by moveable types, wooden blocks or plates, and consists of transmitting impressions to stone, and then working off by a hand-press the quantity required.

The attraction and repulsion exhibited by different substances towards each other are beautifully applied to practical purposes in the process of lithography.[*] The drawing, &c. to be lithographed is written with a peculiar kind of ink, between which and water there is a strong repulsive action, and is transferred by pressure to a fine grained and very porous stone; or a reverse drawing is made at once upon the stone. When an impression is to be taken, the stone is wetted, and freely absorbs the moisture, except in those places that have been inked, which, therefore, will repel the water and remain quite dry. A roller containing the same kind of ink, is next passed over the stone, and the ink adheres only to those places which have repelled the water, the other parts remaining perfectly clean. So delicate is the manipulation required in this process, that touching the stone with the fingers will leave an unctuous mark, to which the ink would adhere, and which, therefore, would be accurately, though unintentionally, transferred to the paper in printing. When the stone is inked, the paper previously damped is placed upon it, and by means of a peculiar hand-press any number of copies may be struck off.

The introduction of colours into lithography is of comparatively recent date, and is achieved by the application of a separate stone for each tint. To such perfection has it been brought, that lithographs now faithfully imitate and almost compete in point of excellence with water-colour drawings.

THE PROPOSED SUEZ CANAL.—This project is about being tried by a Company with a capital of £8,000,000 sterling, in 400,000 shares of £20 each.

---

[*] *Lithos*, a stone; and *graphe*, I write (Greek).

THE BUILDERS' ASSOCIATION AND THE OPERATIVES.

THE late meeting of the operatives at the Rotundo was an immense demonstration of that power which exists in the masses, when peacefully and legally exerted. As if organized in the highest degree, they poured forth their thousands upon thousands in the most orderly manner, to show that aggression should not be made upon them with impunity; and sacrificing, when need arose, an immense amount of money, *we* should say very many hundreds of pounds upon this one object. Whether it were wise or not, is not our province to decide; nevertheless, if we might offer an opinion, we should say it was premature. The operatives, naturally alive to the overwhelming and crushing power of capital when exerted in collective force, beheld in the long array of the Builders' Association, names of their most respected employers in coalition and loving brotherhood with a few who had ever warred against them; and interpreting their first and infantile breath as exerted to hurl defiance, no doubt imagined a new and potent organization looming in the future, which would threaten to annihilate the long-cherished rules and regulations of their respective bodies.

What was the origin of this? The Builders' Association issued a declaration in the form of a report, that "they would not recognize the principle which dictates a uniform standard of wages." True, they may not recognize it, but, possibly necessity, public opinion, or some other cause, obliges them to tolerate it.

We will not here enter into the question whether a uniform standard of wages is right or the reverse, or whether or not a change would tend to a depreciation of the value of labour; but for a moment let us consider the relative position of employer and operative. Is it not patent to all that the welfare of the one is intimately associated and identical with the other? Is not the builder more prosperous, while the operative is better fed and better clothed, when wages are at the highest? What is labour but the capital of the working man, which, like other mercantile produce, is borne to the highest market? If in superfluity, it must succumb; if the supply be barely equal to demand, it must hold its position. And if this be true, how can any association or combination (we might say) reduce wages?

Reading the report recently issued by the Builders' Association, we are led to understand they express an opinion of what they consider an absurdity, namely, that all operatives require to be remunerated alike. Farther we cannot incline, they have insinuated a desire to adopt classification as a rule, much less encourage any principle which would tend to a reduction of wages. Indeed, we imagine any onslaught, having the latter for its object, would be rejected with that contumely and contempt it deserves, by an overwhelming majority of the builders of Dublin.

Surely the intelligence and good sense of the operatives (and some of them have shown the mantle has not fallen over them lightly or unsparingly) must teach the puerility of doing battle against a mere opinion. This opinion may be incorrect for aught we are cognizant of, still it is but an opinion, and should be treated for so much as it is worth; therefore would it have been wiser to have awaited a more direct declaration of hostilities on the part of their employers.

But a truce to all this! A new era has opened on building. Machinery is doing its work; and, aided by steam, its giant footfall and iron rule is steadily treading its way through the length and breadth of the land, classifying the employer as well as the employed. The employer who will not evoke its aid will be speedily and quiescently placed *hors de combat*, else he dwindles to the fourth or fifth estate, with but half the independence of the operative, yet still endeavouring to grasp the shadow of his former self.

On the other hand, the operative has need keep watch and ward; as in carpentry, machine-made doors, window-frames, sashes, shutters, and mouldings *ad libitum*, are produced for less than the present cost of labour; as the arts of the sculptor, the marble mason, and stone mason are equally infringed upon, we should not be surprised if ere long the kindred crafts and mysteries of the stonelayer and bricklayer, with others of lesser note, were monopolized to some extent by the great and all-absorbing artizan of modern times. Therefore it behoves both parties to cast aside their petty jealousies, and with a good will, working hand-in-hand together, advantage themselves, while they cannot arrest its progress.

IRISH GRANITE *versus* WELSH WHINSTONE.

A PRACTICAL VIEW OF RECENT PAVEMENT OPERATIONS.

So much has been said and written of late years respecting the pavement of our city, and so great has been the outcry against the lavish expenditure of public money—collected by heavy taxation on the citizens—in mere experimentalizing, that we have jotted down a few incontrovertible facts, founded on calculation and experience, to prove the unjustifiableness of our native material being shelved to give place to the products of other countries, and of enriching Welsh quarry-men to the detriment of our own; as well as expending large sums abroad in the employment of labourers, while thousands are idle at home.

The requisites of a good paving-stone are, hardness combined with roughness; no stone combines these qualities so perfectly as "*granite*;" the feldspar in granite ranks in degree of hardness with steel, but quartz, the other principal component, ranks with hardened steel. The feldspar disintegrates before the quartz and keeps the pavement rough. But the granite must not be surface rock, softened by exposure to atmospheric influence, which from its softness is preferred by the quarrymen, being more easily wrought. Grafton-street was paved with this surface-stone in 1856, in blocks of unequal depth upon a badly-prepared foundation, which very unjustly brought Irish granite into disrepute for paving. A sample of inner close-grained granite paving sets is laid down on Essex-quay, opposite Nos. 4 and 5, procured from Foxrock at the desire of Committee No. 1 of the Dublin Town Council, by Mr. Hugh Kelly, one of its members; these stones cost 15s. 6d. per ton, delivered into Hanover-street depot; 1s. additional, or less, would probably pay cost of royalty and supervision, if the Town Council would themselves work similar granite in the vicinity of Dublin; the total cost of best inner granite would not exceed 16s. 6d. per ton, and might cost much less when wrought on a large scale, and from the inner depths of the rock.

The next best paving-stone readily available in the vicinity of Dublin, is "*limestone*," such as some to be had at Miltown, an easily workable stone, with small crystals through it like mica; this stone may be delivered in Dublin, and cut into sets similar to the shape of the Welch sets, for 7s. per ton.

"*Calp, or black limestone*," comes next; it wears smooth, but by treating it as Sir Richard Griffith recommended that the Penmanmaur stone should be treated, viz., "to make the joints wide, and fill the interstices with gravel and grout," it will afford as good foothold to horses; it costs as much as good limestone, and 1,000 tons of ashlers per week may be obtained.

The green "whinstone" in the vicinity of Dublin is very hard and unworkable; it is so refractory, and cleaves so irregularly, as to render it useless for paving sets; but there seems to be a cleavable variety in Bray Head, and when other quarries nearer Dublin shall be wrought deeper, more cleavable varieties may be obtained.

Upwards of £8,000 worth of Welsh stones were brought into Dublin in 1857 and 1858, at 14s. 6d. per ton, on the Quays, adding carriage, 8d. per ton, makes 15s. 2d. per ton on the streets; these stones are a soft, cleavable species of green whinstone, which will wear smooth and become dangerous after a few years.

In Dublin, if the best pavement be required, nothing can be better than close-grained granite from the interior rock, cut into sets, five inches broad, half an inch asunder, and any length from 9 inches to 16 inches.

But considering that the streets are constantly opened in Dublin for gas and water purposes, Miltown limestone is good enough, quite as good as the Welsh sets which cost double the price—let the streets be brought into section, and paved with small boulder or pebble pavement, well rammed, then lay on an inch or two of concrete, upon which place your limestone sets, half an inch or ¾ inch apart, each set being an oblong block, 6 inches deep, 3 inches broad, and 8 to 12 inches long, with the interstices grouted with ground lime and sharp sand; and this pavement will be found as durable as the Welsh pavement—better because rougher—at half the cost; and all the money spent in Dublin or its immediate vicinity, giving employment at home, where labour is plentiful and work scarce, keeping *our* labourers out of the workhouse, and so lessening the rates, instead of giving employment in Wales, and lessening the rates *there*.

We shall revert to this subject more *in extenso* hereafter.

The Dublin Corporation Paving Committee has advertised for—

18,000 tons of broken whinstone,
15,000 tons of broken limestone,
12,000 tons of round shingle and footway pebble.

AFFILIATION OF SOCIETIES WITH THE ROYAL DUBLIN SOCIETY.

WITH few exceptions, the attempts hitherto made to establish in Ireland—on anything like a permanent basis, capable of reflecting both credit on the promoters, and of extending benefits to the community at large—associations of a scientific or artistic character, have proved comparative failures; and even at the present time there are some which, despite the energy and enthusiasm of some of their members in endeavouring to fulfil the objects of their mission, experience a difficulty in drawing on bare existence. Why it is so? is a subject in itself, embracing too many important causes, to pass over cursorily, so we defer entering on it at present. For such, however, and for others of kindred character, but greater independence and more permanent establishment, a golden opportunity now presents itself—both of adding to their stability, enlarging their educational resources, and contributing to the mental improvement of their fellows, in the invitation of the Royal Dublin Society—that bountiful dispenser of gifts in all that relates to science and art—to come and participate with it share and share alike the innumerable advantages to be derivable from its unremitting labours, during a period extending over a century and a-half.

It is no small favour for a parent Institution like this, comprehending such a galaxy of talent amongst its professors and members—such a magnificent collection of instruction and entertaining *materiel* in its library, museums, galleries, and gardens, thus voluntarily and disinterestedly to open them all freely to others not of its own constitution, rejoicing, as it always has done, to lend a helping hand to those earnestly pursuing their way in the path of progress. Tardy as kindred societies may have been up to the present of availing themselves of the proffered advantages, we doubt not but they will speedily awake to the desirability of doing so; and for general information we append particulars of the chief heads of the arrangement whereby it is intended to carry out this excellent scheme, and we shall feel much pleasure in chronicling the names of each society applying to participate. As yet we can but mention the Dublin Statistical Society and the Dublin Photographic Society.

"The theatre or other apartment to be at the service of associated societies on the same evening as the Royal Dublin Society shall hold its meetings; and the members of both bodies to be permitted to attend." "Members of either societies attending evening meetings are to contribute sessionally 5s. towards a common refreshment fund; and members so paying, to be entitled to purchase for friends an unlimited number of tickets at 6d. each." "Members of associated societies to have free admission to the library, museum, and botanic gardens; without permission to borrow books, introduce visitors, or make use of conversation room." "One member (at least) of council of associated societies to be a member of Royal Dublin Society." "To afford mutual assistance to each other in extending the usefulness and improve the position of the entire body; to obtain for affiliated societies, on favourable terms, all publications connected with Education, Science, Literature, and the Arts, also Parliamentary Papers; to encourage such societies to establish classes for instruction in elementary education, and prepare students as candidates for certificates of the R. D. Society."

"From the bodies in union the R. D. Society requires copies of all reports and proceedings and lists of members, committee, &c. to be furnished to it; a yearly payment of £2 2s. as long as the union continues; and the president or *one* other council member to be a member of R. D. Society, &c., &c."

INSTITUTION OF CIVIL ENGINEERS OF IRELAND.

A MEETING of this body was held on 14th ult.; Mr. B. Mullin, president, in the chair. Mr. Anderson read a paper on "beam and girder bridges," being in continuation of papers read at previous sessions. The author exhibited several colored diagrams, and a beautiful model lattice beam, lent by Professor Downing, of Trinity College, for the occasion. Mr. Anderson paid a tribute to the abilities displayed by Professor Blood, Mr. Bower, Mr. J. Barton, and Mr. Stoney, who assisted him in his investigations. An interesting discussion followed, in which the president, Messrs. Mallet, Stoney, and Bower joined.

ARCHITECTURAL PROGRESS IN BELFAST.

WE were much struck, on the occasion of a late visit, with the numerous additions to the architectural features of this town; the commercial establishments especially being noteworthy for taste, originality, and excellence of design—amongst which we may particularize Hawkins', Lindsay's, Arnott's, and Mackenzie's warehouses, without disparagement to many others also. Unlike Dublin street architecture, there is a uniformity in the ranges, a boldness in the treatment, a lesser display of hackneyed features in the lower portions, and a more careful preservation of harmony in style between upper and lower storeys. The materials of the neighbourhood, doubtless, contribute to the effect of the *toute ensemble*; red brick walling and Scrabo stone or Portland cement dressings, cornices, &c., being predominant, producing a warmth of colour and a contrast very pleasing and artistic. Plate glass, of large dimensions, is coming into general use, and an example worthy of being followed is set in the extreme cleanliness and tasteful dressing of the shop windows. Many public buildings are in progress, but as their importance demands special notice, we defer entering into particulars until a future opportunity.

TURKISH BATHS IN IRELAND.

THE introduction of the "Oriental Hot-air Bath" into Ireland, and more especially the recent project of new buildings to be specially constructed for the purpose at Lincoln-place, Dublin, and subsequently at Bray—as designed by Sir John Benson for Mr. Dargan—having caused a considerable amount of interest and curious inquiry respecting their principle, we subjoin the following extracts from a valuable paper read by Dr. Haughton at the Royal Dublin Society:—

"Two objections are made to the use of the oriental baths; the first, that they are unsuitable to this climate, and the second, that they consumed a great deal of time in taking them, and, therefore, could not be generally resorted to in a mercantile community. In order to show how groundless are these suppositions, I shall lay before you some facts which establish the adaptability of the 'Hammam' to all temperate climates; also the characteristics of the bath. That part of the bath more peculiarly eastern is the hot-air chamber, discoverable amongst some of the oldest ruins, whereas the warm-water bath (such as we use) is quite a modern invention, having been never used by the Greeks at a time when they were considerably proficient in the art of bathing, and were in the habit of making it a daily practice.

"Great truths, although often neglected and even sunk in oblivion, are never suffered by the Creator to be forgotten, but some one always remains to bear witness to them, and in many cases the ruins of their ancient glory remain to declare their excellence, and reproach us with our degeneracy. The importance of physical culture, and its profound appreciation by the ancients, is one instance of this; nor does the additional cultivation now bestowed upon the faculties of the mind, at all exempt us from the evil consequences resulting from neglect of the grosser part of our nature. I may mention a few out of many countries where an inquiring mind may find sermons in stone and mortar on this subject, and convince itself that the salutary practice of bathing always has been, and still is, appreciated in almost every quarter of the world, except the *small portion of it* which we are in the habit of considering to have gone so far a-head of those nations from whom it received the arts and sciences, as to be incapable of learning anything further from them. Interesting remains of the hot-air bath, whose antiquity tradition does not attempt to fathom, still exist in the district of Lebanon, in Assyria, Egypt and Morocco. Italy abounds in them, and even France and England furnish us with abundant evidence that, hundreds of years ago, this kind of bath was in full operation in this very climate. The American Indian is well acquainted with its remedial virtues, and frequently has recourse to it; and the very same thing is now done in different parts of this island by the uneducated peasantry, with the happiest results.

"Two varieties of sweating-houses (as they are called) exist in Ireland; one capable of containing a good many persons, and the other only intended for a single occupant."

The following is from a description by the Rev. Robert Gage:—

"In general, Rathlin is a very healthy place, and many of the people have attained to a good old age. Asthma is the most common disease, probably arising from the sulphureous vapour emitted from the turf or peat, with which it is strongly impregnated. Of late years, however, it has been less frequent, owing, perhaps, to the improved state of the cottages. Pulmonary consumption is very little known here. When the people are attacked with rheumatic pains, they have recourse to a remedy of long standing, in the efficacy of which they have great confidence. In several parts of the island small buildings, called 'sweat-houses,' are erected, somewhat in the shape of a bee-hive, connected with stones and turf neatly put together—the roof formed of same material, with a small hole in the centre. There is also an aperture below, just large enough to admit one person on hands and knees. When required for use, a large fire is lighted in the middle of the floor, and allowed to burn out, by which time the house has become thoroughly heated; the ashes are then swept away, and the patient goes in, having first taken off his clothes, with the exception of his under garment, which he hands to a friend outside. The hole in the roof is then covered with a flat stone, and the entrance is also covered up with sods to prevent the admission of air. The patient remains within until he begins to perspire copiously, when, if young and strong, he plunges into the sea, but the aged or weak retire to bed for a few hours. This primitive vapour bath has been successful in removing pains of long standing, and people from the mainland have come for the express purpose of trying its efficacy. It is not, however, applied exclusively to the cure of disease, for the young women not unfrequently resort to it after burning kelp, to clear their complexions, especially if it should happen *to be near the time of a Ballycastle fair*. As the heating of the sweat-house is considered rather expensive, from the quantity of fuel required, a number of persons go together, and but for the darkness of the place, would present a sufficiently ludicrous appearance. The period of remaining is discretionary with the patients, but at the end of half an hour the house is generally cleared, and the fresh air once more admitted, until its services are again required."*

NEW CHURCHES IN MELBOURNE.

PLANS are at present in course of preparation by Mr. Moran, architect, of this city, for two new Roman Catholic churches, to be built in the diocese of Melbourne. One comprises nave, chancel, sacristy, and tower at north-east angle; is in the early English style, and measures in the total 115 feet by 85 feet; has open timber roof chamfered and stained, triple lancet windows at east and west ends, and single lancets at sides. The other is in the style of 14th century, comprising nave, chancel, sacristy, and lateral chapels, and tower at west end; dimensions—145 feet by 60 feet in the clear, with confessionals outside; open timber work and partially panelled roof, great five-light east and west windows, clerestory and nave; three-light windows, with tracery. An elaborate screen separates nave from chancel. Mr. Moran is also architect to Ballyvaughan and Galway Augustinian new churches.

COMPETITION.

A LIMITED competition is about to take place for a new church to accommodate 1,500 of the Molyneux congregation, the Rev. Dr. Fleury, Minister. The cost will be about £7,000, and the architects competing are Messrs. M'Curdy, Burne, and Rawson Carroll.

IMPROVEMENT OF VICTORIA, AUSTRALIA.—It is intended to expend a sum of £1,545,000 in public works in this colony, which is rapidly extending.

---

* To be completed in our next.

Correspondence.

AMATEUR ARCHITECTS AND BUILDERS!

DEAR MR. EDITOR—Amongst the many duties both to the profession and the public which devolve on you in the responsible undertaking you have commenced—and which I sincerely trust you will succeed in carrying out advantageously to yourself—there is not one of less moment than that of showing up, in their true colours, those egotistical and self-sufficient people who assume the office of "architect and builder" with as much confidence, and more so, than if they had been regularly trained to them. What, sir, is it that gives birth to such architectural monstrosities as we daily notice perpetrated in our commercial and domestic dwellings but this? Individuals, rich in pocket but poor in heart, to save the petty commission to which the professional man is entitled—which is only equal to that of the agent who "lets a house or a farm," and *half* what is paid to an auctioneer for a stroke of his hammer—undertake buildings on their own account, commencing with the designing (save the mark!) and ending with the superintendence of the various artificers' works necessary even to completion. Surely it is no wonder to see in such cases walls not parallel, at right angles, or plumb, though intended to be so; windows and doors badly hung, and split in all directions; cracked plastering, leaky roofs and gutters, settlements, &c., not to speak of the general absence in systematic arrangement internally, and suitable elevation externally. Many of this class might as reasonably undertake the designing and construction of a complicated piece of machinery, for all that they know about either, and though at first imagining that they are doing it "very knowingly" by having neither architect nor builder, but acting in the double capacity themselves, and engaging an inferior class of workmen to adapt materials picked up at auctions and rubbish sales; they ultimately find that they have paid "too much for their whistle." With such a course pursued, may I ask, sir, how is to thrive

A MAN WHO UNDERSTANDS AND MUST
LIVE BY HIS BUSINESS.

MERE SKETCHES!

SIR—I should like to know if I, of my professional brethren, am singularly unfortunate in meeting with parties intending to build, who, to guide them in their work, only require an architect's services as regards *mere sketches!* How painfully ludicrous is it to witness the undercurrent of niggardliness so manifest in clients who, to save the professional percentage, seek to barter for a sketch and an *outline* specification, impressively arguing that same could be executed in an immoderately limited period by an *expert* architect, and placeing a value on the *manual* labour thereon, with no consideration for the *mental*, or the time previously occupied in studying for and attaining a professional position. C.

Notes of New Works.

A new District Model-school is to be built at Derry, according to drawings prepared at the office of Public Works. The plan is a parallelogram, with a frontage of about 208 feet, broken by many projections; the main building—two stories high with basement—comprehending a recessed centre of 57 feet in width, with gabled wings at either side of 22 feet in width, in which the drawing-school and pupil-teachers' room are respectively situated, and approached by a corridor which also leads to a maratime school 18 feet square; master's room, office, and boys' school, 50 feet by 40. Beyond main building is a lower connecting structure with high pitched roof, and containing museum and library, infants' and girls' schools, 48 feet by 25; and boys', infants' and girls' class-rooms. The style is early English; and the gable containing pupil-teachers' room has a projecting bay window, with three light-pointed arched windows above it; and the outline of the gable is picturesque, being broken at one side by a buttress surmounted by a chimney flush with front, and quaintly terminating near apex. Dormer windows, tall chimneys, and finials of appropriate character are introduced. In corresponding gable will be a large three-light window, with trefoil heads formed in a large ope. Connected with this gable by a recess of 28 feet, is seemingly a flank divided into 3 bays, with triplet windows and tastefully designed buttresses between, at the termination of which is a projecting gable with 8 light window and wheel over same and a tall projecting chimney at the side. The walling is to be rubble of greenish tint, and the dressings of Scotch stone. The design reflects credit on the author, and is an improvement on other scholastic buildings proposed by the same establishment.

A conventual chapel, 70 feet in length and 20 in breadth, has been added to the Presentation Convent, Enniscorthy.

Building operations at Bray are likely to be more extensive next year than they have been hitherto. Mr. Dargan having purchased a large tract of ground from Mr. Quin, is about erecting two pair of semi-detached villas and terraces of commodious dwelling-houses, also Turkish baths on a large scale; of which, we understand, Mr. Cunningham is the contractor. For the former Mr. Wilkinson is the architect, and for the latter Sir John Benson. A new church is in progress from designs by Mr. Barre; as also are some works of a domestic class from the designs of Messrs. E. Carson, Burne, and J. J. Lyons, architects, respectively.

Mr. Hugh Kelly has been declared the contractor for the erection of the new buildings at Mount Argos, near Kimmage, intended for conventual purposes. The plans were made in Rome, and the superintendence is entrusted to Mr. Patrick Byrne, architect. Full particulars shall appear in next No.

The foundation-stone of a porcelain factory has been laid at Belleek, County Fermanagh.

A new hall for Protestant meeting purposes is to be erected at Cork. Upwards of £700 has been already subscribed; Lord Bandon and Allessandro Gavazzi having contributed £10 and £5 respectively.

The Catholic Young Men's Society has taken the Music-hall in Lower Abbey-street, with a view to its conversion into a lecture theatre, reading-rooms, library, class-rooms, &c., for the use of that body. We understand an architect has tendered his services gratuitously, and that plans have been prepared.

The Ecclesiastical Commissioners are about having extensive works executed at the churches of Desertaghill, Co. Derry, and Tomb (Camolin), Co. Wexford; and they also intend enlarging and repairing the church of Drumkeeran, Co. Fermanagh.

A new convent for the order of St. Bridget is to be built at Goresbridge, Co. Kilkenny; and Lord Castlerosse has subscribed £100.

The Guardians of the Limerick Union are about erecting, for the use of the Catholic inmates, a chapel to cost £500—the dining-hall being at present used for divine worship.

The new parochial church of Blessington is in progress of completion, from the designs of Mr. M'Carthy, R.H.A., architect. It comprises nave, transept, sanctuary and chancel; is in the Gothic style, and measures from east to west, 90 feet, and across transepts, 60 feet. Mr. Robert Farrell, of Lombard-st., the builder. Expenditure about £2,600.

The first stone of a new community residence for the missionary oblates of Mary Immaculate, has been laid at Inchicore.

A colossal statue is to be erected at Carlisle, as a memorial of the late Mr. Samuel Steele.

The new monument to the memory of Hugh Miller, is in progress of erection at Cromarty.

Railway Notes.

Messrs. Malcomson, brothers, have invested £83,000 in preference shares of the Waterford and Limerick Railway.

The Clonmel and Dungarvan line has been abandoned, partly owing to the engineer not being able to complete the plans within the time required by standing orders.

Arrangements have been made for transferring the Waterford and Limerick Railway to the Great Southern and Western.

Mr. Dargan is the contractor for the Tuam and Athenry Railway at £67,000.

The Banbridge and Lisburn Railway is being laid out by Mr. Blakiston, C.E.

The proposed railway from Londonderry to Letterkenny consists of three parts: from Pennyburn to Farland Point, thence to Newtowncunningham through M'Cormick's slob-land, at Inch Level; and at Newtowncunningham another extension under other management. The distance to Letterkenny is 21 miles. Neccessary preliminaries have been completed.

IMPROVEMENTS IN SUBMARINE TELEGRAPHS.—An improved cable has been invented on which the outer fold of wires, instead of being disposed spirally (like an ordinary rope) round the core, are plaited or braided like the woollen covering to the cords of window-blinds.

THE PONTIFICAL RAILWAY CARRIAGES.—The carriages specially constructed for the pope comprise a sort of terrace, an ante-chamber, a throne-room and a bed-room. The throne-room is magnificently fitted up, and decorated with paintings and figures. The bed-room has blue hangings, and is adorned with a superb painting of the Immaculate Conception, by Millet. The exterior is tastefully decorated with objects in bronze.

Reviews.

The Law of Patents, for Inventions in Ireland, and Registration of Designs.—(O'Gorman) Dublin.

WE beg to direct attention to this excellent and most useful treatise, by James P. Byrne, Esq.; and in common with our contemporaries recommend it to the mind of every man who is capable of contriving an invention. Everything that could be said in praise of any work, has been said of it—*we* could scarcely add a word, without repetition. This, however, we may observe, that if, as it was truly said, the first edition was "so very cheap that it should be placed on every library and office table," the second is *cheaper*, for it is published at half the original price. Hitherto Inventors in Ireland—the poorer classes especially—laboured under extreme disadvantages as regarded economy and facility in getting their inventions patented and designs registered, being obliged to place themselves in the hands of London agents, thereby incurring both extra outlay and increased delay, which under many circumstances may prove most detrimental, and which all conversant with the routine observed in some offices in Chancery Lane will readily understand. To remedy this, however, Mr. Byrne has not only prepared a lucid exposition of the law as regards Patents, &c. in this country, but offers through the medium of his own agency a systematic and direct mode of protection combined with comparative enconomy and increased facility.

Rural Architecture. By John White, Architect. Blackie and Son, Glasgow and London, &c.

THE author of this work has fulfilled his task somewhat more creditably than the generality of those who, like him, publish the unmatured offsprings of their imagination in the shape of designs for public or private dwellings; and which are usually replete with features offensive to a professional eye, calculated to act detrimentally on public taste, and materially to injure the practice of legitimate practitioners. Though the designs in the book before us do not, in *some* respects, exactly correspond with *our* taste, either in point of arrangement or external contour, nevertheless, we feel bound—assuming that architects like doctors, *may* differ—to state, that there are many meritorious features introduced, especially in the details, and that from its perusal and examination architectural students may derive many valuable suggestions.

Continental Notes.

A statue of Peter the Hermit has been inaugurated in the gardens of the old monastery of Neumoustier.

A marble statue is about to be raised by public subscription at Nice, in honour of Massena.

The Academy of Fine Arts, at Copenhagen, have elected as honorary members, Sir Charles Eastlake, R.A., Sir Edwin Landseer, Sir Charles Barry, Professors Cockrell and Donaldson.

NEW MONUMENT IN PERE LA CHAISE.—Amongst the recent additions, those of "Rachel," the actress, and "Alfred de Musset," the poet, are the most noteworthy. The former consists of a small Grecian chapel, with the word "Rachel" between two crowns, and a diadem carved over the entrance, and is situated to the right of the Israelite ground; and on that of the latter a marble bust of the deceased has been placed, with a weeping willow in front, and on the extreme side a verse from his work is engraved.

The telegraph between the Dardanelles, Syra and Chio has been successfully laid, but that between Candia and Egypt has been broken.

The new church of St. John the Evangelist, recently erected at Pittston Pa, was solemnly dedicated recently.

Messrs. Deane and Woodward, of this city, architects, designed the new offices recently erected in London for the "*Crown*" Life Assurance Company. The front elevation is of a highly decorative character in the Byzantine style, and a variety of colour is produced by the adaption of different stones, marbles, &c.

Fifteen hundred pounds have been received towards the erection of the George Stephenson monument.

Miscellaneous.

MECHANICAL LABOURS OF THE ANCIENT EGYPTIANS.

The history of Egypt presents nothing more wonderful than the magnitude and durability of the public works which were accomplished by her ancient inhabitants. Prodigal of labour and expense, her architects appear to have planned their structures for the admiration of the most distant posterity, and with the view of rendering the fame of their mechanical powers coeval with the existence of the globe itself. It has been suspected that the omnipotent spirit of religion mingled with the aspiration of a more earthly ambition, in suggesting the labyrinth, and in realizing the vast conception of the pyramids. It must be acknowledged that in countries comparatively rude, vastness of size takes precedence of all other qualities in architectural arrangements; and as a proof of this, it will not be denied that even the pyramids sink into insignificance when compared with an undertaking proposed by Stesicrates to Alexander the Great, viz., the conversion of Mount Athos into a statue of the victorious monarch; the left arm to be the base of a city containing 10,000 inhabitants, and the right to hold an urn, from which a river was to empty itself into the sea. Herodotus speaks of the labyrinth as one of the most surprising efforts of human ingenuity and perseverance; and is said to be superior in magnificence to the temples of Ephesus, Samos, and other Greek structures. There are 3,000 apartments—1,500 above ground, and a like number below. The pyramids during several thousand years have attracted the curiosity of travellers, and given rise to much learned disquisition. In the erection of the largest pyramid 100,000 men were employed, who were relieved every three months; ten years were spent on the road whereon the stones were to be drawn, and twenty years in the formation of the pyramid itself, which is composed of stones skillfully cemented together, and none of them of less dimensions than 30 feet. The machinery for raising the stones is said to have been of wood, and necessarily rude, and by these tier after tier was completed; but *we* fear it must remain for ever a matter of conjecture how solid blocks of many hundred tons weight were separated from the adjoining mountain and lifted into the air by the means then at command. The dimensions of the great pyramid is stated, according to Herodotus, to have been 800 feet at base, and same height, though Davison says the length of the sides was 746 feet, and the height 461 feet only. Various dimensions are given, but it is difficult to know on which to rely. Belzoni ascertained the dimensions of the second pyramid to be at base 684 feet, and height 456 feet. The sphinx, another Egyptian curiosity, representing a *couchant* figure of a beautiful woman combined with the body of a lion or other animal, and with outstretched paws 50 feet in length, was found to be 27 feet high above ground, 30 feet wide at the breast, and its entire length about 113 feet; but, according to Dr. Richardson, it is 120 feet, and the elevation of the head above the sand from 30 to 35 feet. A temple was erected at Sais in honour of Minerva, and the sanctuary brought by Amasis from Elephantine consisted of a *single* stone, and the carriage of it employed 2,000 men—all sailors—for three years; the length being 21 cubits, the width 14 feet, and the height 8 feet. It was placed at the entrance of the temple, and the reason assigned for its being carried no farther is "that the architect, reflecting upon his long fatigue, sighed deeply, and thereby alarmed the king, who considered it as a bad omen." The practice of erecting monolithic temples or sanctuaries hollowed out in a single stone, was very general in Egypt; but we question whether, with all the appliances of machinery now-a-days our mechanics could remove from a quarry and convey to a distance of 400 miles masses of rock 32 feet long, 21 feet broad, and 12 feet in height? Among the mechanical labours of the ancient Egyptians we ought to enumerate some of those extensive canals or water-courses, which were constructed either for the purpose of irrigation or of facilitating the transactions of commerce. In reference to the former class, we may particularize Joseph's river, as only one instance out of many in which the skill of the artificer rivalled the magnificence of nature. As a species of water conveyance, the canal which connected the Nile near Bubastis with the Red Sea at Arsinoë, in the vicinity of the modern Suez, was the most remarkable. Of the 92 miles of inland communication of which it consisted, 65 were accomplished by human labour. Aristotle, Pliny, and Strabo ascribe the cutting of this canal to Sesostris. *Facts* such as *these*, with many others too numerous to mention, suggest to reflective minds the question, "Are *we* progressing in everything?"

Economy of Risk and Labour.—Whatever diminishes the risk to life or health in any mechanical operation, or any exertion of bodily labour, lessens the cost of production by diminishing the premium, which is charged by the producers to cover the risk. The lightning conductor diminishes the risk of property, in the same way that the safety lamp diminishes the risk of life, and by this diminution the rate of insurance is lessened, and the cost of production therefore lessened.

The Positive Influence of Science in the direction of labour, is exhibited in the operations of mechanics and chemistry applied to the arts, in the shape of machines for saving materials and labour, and of processes for attaining the same economy. *These* are the influences of science upon labour; not so direct as the mechanical skill which has contrived the steam-engine, or so indirect as the operation of ethics upon the manufacture of a piece of woollen cloth; but which confer a certain, and in some instances enormous benefit upon productions by the operation of causes which, upon a superficial view, appear to be only matters of laborious but unprofitable speculation.

Building Materials in Co. Wexford.—There is a remarkable sandstone formation nearly in the centre of the county at Knock-a-boka, near the Harrow, bearing a close resemblance to the Caen stone, but which for four or five centuries has remained concealed. It can be worked at one-third cost of granite. In point of durability it is said to be excellent. After the arrival of the Anglo-Normans in the county, they erected several extensive ecclesiastical edifices chiefly of this stone, and many remains of it, where used for columns, fonts, &c., are still found in a high state of preservation. Slate likewise abounds in this county, but it has not been as extensively applied to building purposes as that of other localities in Ireland. The clay in north Wexford is said to produce bricks approximating in quality to the well-formed and durable Flemish bricks; and is capable of being moulded and fashioned like Terra Cotta. Limestone rocks are found in the vicinity of Wexford and Hookhead, and yields a lime stated to be equal to the blue-lias lime of England.

Ancient Fortifications in North America.—In the State of Ohio there are numerous remains. At Cincinnati there is a circular wall or embankment, 800 feet across; the bank is 30 feet thick at the base, and from three to six feet high. There are several others of smaller dimensions, besides four mounds, one of which is 27 feet high, and 440 feet across. On the summit of an elevated hill, two miles below Hamilton, the walls of an ancient fortification enclose 80 acres of ground. In Highland County, two miles west of Chillicotta, there is a wall of stone from 12 to 15 feet high, and 4 or 5 feet thick, which encloses upwards of 100 acres. Near Piqua, in Miami County, there is one which encloses about 17 acres in a circular form; the walls all around are built of stone carried from the river, 600 yards distant. A wall, from 4 to 7 feet high, extends seven miles from the Great to the Little Scioto river. The trees growing on these cannot be less than 400 years old. There are remains of the same kind all the way from Ohio south and south-west to the Floridas. They are also found in Michigan to the north. On the river Huron in that district is a fortress with walls of earth quite the same as those of Ohio and Kentucky; another, 3½ miles below Detroit, enclosing several acres in the midst of an extensive marsh, with a breastwork 3 or 4 feet high. On the west of Lake Michigan is a circular breastwork with flanks reaching to the river, 4 feet high, extending nearly a mile, and capable of protecting 5,000 men. The outlines had been traced in angles, like modern fortifications.

Science and Labor.—Individuals whose occupations are chiefly of a laborious and physical nature, are exceedingly apt to draw invidious comparisons betwixt the value of their own efforts and that of those classes of men who mainly depend for their subsistence on the exercise of their mental faculties. To do so, however, is quite adverse to the principles developed by political economists, and in reality quite unworthy of any man laying claim to the most common understanding. It is only by the extraordinary combination of science with genius and capital, that the working man is furnished with employment, or enabled to support his family; and without a body of men in the country, whose labour consists simply of *thinking*, society would fall in pieces, and poverty visit the fireside of the artisan and peasant. Both mental and physical labourers, however, are working classes, and each should learn to know the value of the other. No one can say that *mental* labourers are not workers; they are, taken as a class, the hardest workers in the community.

Right Direction of Talents dedicated to Art and Literature is all that is required from those who address themselves to those pursuits. He, therefore, who beguiles a vacant hour of its tediousness, by some effort of intellect that captivates the imagination, without poisoning the morals—and he, who by the exercise of his art produces forms of beauty, which awaken in the mind that principle of taste which more than any other faculty requires cultivation—have each bestowed benefits upon the world, which may be accurately enough measured even by the severe limitations of political economy; they are profitable labourers and benefactors of their species.

Workmen's Wages.—If wages were fixed by law at a high rate, and population to continue to increase, the consequence would be, that a portion of workmen would be employed at such rate, but the rest would be reduced to beggary. On the other hand, if the rate fixed by law were too low, then all would be fully employed; but the most industrious and valuable workman would be reduced to a level with the idle and ignorant; which proves that the restrictions which well-meaning people would impose for the better regulation of wages by boards of trade, are worse than useless, inasmuch as their tendency is to prevent the extension of manufactures, and diminish the employment and value of labour. Wages never can be maintained above their natural level by artificial means; their natural level depends upon the proportion which the population or supply of workmen bears to the demand for labour or extent of employment; which depends upon our superior powers of production, improvements in machinery, and amount of accumulated capital. The interest of the workman and his employer are the same, and prosperity depends upon their united industry and ingenuity.

LONGEVITY *versus* OCCUPATION.—*Masons* inhale particles of sand and dust arising from the chippings of stones. Their frequent exposure to the vicissitudes of the weather, muscular exertion in lifting weights, and sometimes their addiction to intemperance, promptly take effect on their physical state. The bronchial membrane often becomes chronically inflamed from the inhalation of the dust, and dissipation makes their constitution susceptible of atmospheric changes, and hence they are frequently affected with pains in their limbs. Masons are shortlived, dying generally before they attain the age of forty. *Miners* suffer considerably when employed in sandstone ore, but not in limestone. They seldom work more than six hours per diem, yet they rarely attain the age of forty. Smelting is a most fatal occupation; the appearance of the men is haggard in the extreme. Fork-grinders who use a *dry* grindstone, die between the ages of twenty-eight and thirty-two, while table-knife grinders who work our *wet* stones, survive to between forty and fifty. *Turning of cast iron* is very trying; *draw-filing cast iron* is a very injurious occupation, the dust being abundant, and rising so as to blacken the mouth and nose. The lining membrane becomes first affected and preternaturally dry; next the air tube, then respiration is difficult, and an habitual cough is produced. The common termination of the existence is bronchial or tubercular consumption. *Filers* are most unhealthy men, and remarkably short-lived. *Plumbers* are exposed to the volatilized oxide of lead which rises during the process of casting. The common working of the metal also seems to be deleterious. *Carpenters* are not supposed to last in their utmost vigour above eight years. Almost every class of artificers is subject to peculiar diseases, occasioned by excessive application.

COMBINATIONS.—There is hardly anything more odious in our great manufacturing and trading system than combinations, whether of masters or workmen. They are neither more nor less than conspiracies to secure private and unnatural advantages at the expense of the public, and in their character are essentially opposed to those generous and really profitable principles of free trade which all sound thinking men are now ready to advocate; and which at least the working classes have been long strenuous in insisting upon as necessary for their welfare. We hold it as an imperishable maxim in our general economy that everything vicious will sooner or latter find its level. Labour, like gold and silver, can be made valuable by its scarcity only and no other contrivance. All the acts of legislation, all the combination and devices amongst workmen and themselves, must fail in rising to a high price that which is redundant.

CITY OF NEW YORK FREE ACADEMY.—This building is situated on the south-east corner of Twenty-third-street and Lexington-avenue in the upper part of the city, being convenient of access from all the great thoroughfares. The style of architecture is the same as that of the towns and colleges of the fourteenth century in Europe. The dimensions are as follows:—length 125 feet and breadth 80 feet, height to eaves 65 feet, and to top of gable 100 feet, to the top of towers 110 feet. It is divided with a basement 9 feet in height, with three other storeys, and a great hall 125 by 60 under the roof, which is of high pitch and constructed of open timber-work with carved ribs, &c.; at intervals dormers are introduced. Expenditure, without the furniture, 46,000 dollars. Mr. Renwick, architect.

PERFECT SCAVENGERING is the first essential to cleanliness, and to the protection of the air from pollution in and about buildings, the *excreta* arising from which are dejected into dry sand or gravel; whilst the soil drainage of buildings will not supersede the necessity of scavengering; nor, having regard to the wholesomeness of the locality, ought it to be preferred to the dry cesspool where the dry cesspool is available to the effect already indicated; unless provision be first made for scouring the contents away, and for removing directly to the upper air the gases which they will evolve in their passage. *Our local Corporation should observe this.*

OAK PAPERS.—The invention of Mr. John Strather, of Hull, for producing oak or "wainscot papers," has lately attracted considerable attention. The grain, being printed from a piece of the wood itself, is perfectly true to nature, and far surpasses any produced from blocks engraved by hand. From the same piece of wood, the pattern can be varied almost *ad infinitum*, for by simply taking off a shaving a different design appears.

Science, when well digested, is nothing but good sense and reason.

DEMAND FOR IRON.—The total make of pig iron in 1857 was 3,659,447 tons, against 3,586,377 tons in 1856. Of this quantity 918,000 tons were made in Scotland, 1000 tons in Ireland, 1,007,776 in Wales, and the remainder in England. The shipments of Scotch pig iron in 1857 were 267,446 tons foreign, and 559,036 coastwise. The foreign quarters to which it was sent were—42,200 tons to the United States, 15,300 to British North America, 67,700 to France, and 81,100 to Germany. To America the shipments are falling off of late, but to France and Germany the supplies of our iron are increasing. The shipments of pig iron, bundle, bar, and rail iron from each of the principal ports in 1857 are particularised. Glasgow, Middlesborough, Newport, Cardiff, and Liverpool are those chiefly interested in the trafic. The exports of British metals in 1857 show a sonsiderable excess in quantity over either of the two preceeding years. The iron and steel of differnt kinds amounted in bulk to 1,539,386 tons, lead 22,100 tons, tin 43,758 cwts., and copper 25,221 tons. In the aggregate, the declared value of our British metals shipped, reached £18,500,000; and this is exclusive of the large imports of foreign and colonial metals, and re-exports of the same—a trade in which no other country comes near us. The active operations of our mining districts, are at least indications of progress.

BOILERS IN KITCHEN RANGES—SERVANTS BEWARE!—If a boiler become red hot, or even nearly so, owing to neglect in keeping a supply of water therein; the water when afterwards thrown into it may assume the spheroidal state, and then flashing into steam of enormous pressure will burst the boiler, causing destruction of property and possibly *loss of life* by the explosion. Even when boilers are self-supplying. they should be carefully watched, for an impediment in the pipe will cause the supply to cease. Water begins to be spheroidal at something less than 500° Fah. Incautious servants sometimes leave the boiler-lid open for several hours, which gives vent to evaporation, and not unfrequently throw in volumes of water into a nearly empty boiler, to the imminent risk of their own lives, for the reasons above stated. Proprietors of houses cannot be too cautious both in seeing their gas *properly* turned off into the street-main, and their kitchen boilers kept constantly filled, or nearly so, with water.

THE SCREW *versus* THE PADDLE.—The various inconveniences attending the use of paddle-wheels have caused them to be more or less superseded by the Archimedean screw. Though its general application to steam-vessels has only been of comparatively recent date, it was used at New York by Mr. Bushnell of Connecticut as early as 1776, to propel a submarine boat contrived to fix to the bottoms of ships an explosive preparation to blow them up. It consists of a variable number of feather-edged paddles constituting portions of a plane wrapped round an axis, in such a manner as to be attached by its edge and form parts of a screw having a thin but very deep thread. The axis to which these are fixed pass through a water-tight compartment into the vessel, and motion communicated to it by a steam-engine. The screw is usually fixed in an aperture in the dead wood exactly in front of the rudder, and is sometimes so arranged as that it may be lifted off when not in use. To produce any effect, it must move with considerable velocity, hardly obtainable from an ordinary steam-engine. The screw causes little disturbance in the water; it is always submerged, which is not the case with paddle-wheels, one or the other of them being, in rough weather, often completely raised out of the water, rendering them not only useless but cumbersome.

SELF-PAYING MUNICIPAL IMPROVEMENTS.—The great alterations made to some of the thoroughfares in Paris during the last seven years, whereby 3,725 old houses have been demolished, and 8,187 new mansions and spacious streets constructed, appear by a recent report of the Prefect de la Seine, to have left, after deducting all expenses, a large balance in favour of the municipal exchequer.

To Correspondents.

WE have to acknowledge the receipt of numerous letters from various parts wishing us success in our undertaking, and for which, as also for the substantial co-operation extended by our Subscribers and Advertisers, we beg to tender our grateful thanks collectively.

NOTICE.

Orders for Subscriptions to, and Advertisements for, THE DUBLIN BUILDER, *will be received at the Proprietors' Office,* 17, *Lower Gardiner-street, or by Mr. Mason,* 24, *D'Olier-street;*

At CORK, *by the Agent, Mr. S. M. Peck,* 40, *South Mall, Mr. Massy, Mr. Murray. and all Booksellers;*

At BELFAST, *by the Agent, Mr. Francis Dowd,* 47, *Townsend-st.; Messrs. Henderson, Phillips, Gribbin, and all Booksellers;*

At GALWAY, *by Mr. T. J. Connolly, and Mr. Wade, Booksellers.*

Yearly Subscription (payable in advance), 3s.; *per post,* 4s.

Miscellaneous.

ART-UNION OF IRELAND,

Established under the auspices of the Irish Institution, according to Act of Parliament, on the system of Money Prizes, with the right of selection in every case by the Prize-holder.

ANNUAL SUBSCRIPTION—ONE GUINEA.

One chance in the Annual Distribution for each Guinea subscribed. The first distribution in April, 1859.

Trustees—Right Hon. Maziere Brady, John Barton, Esq., and Sergeant Berwick, Q.C. Treasurers—The Bank of Ireland and its branches. Secretary—George F. Mulvany, Esq. Clerk—Mr. T. H. Killingley.

Office, No. 73, GRAFTON-STREET, Dublin, where all communications may be addressed, and subscriptions will be received. Prospectuses sent free by post.

THE ROYAL EXCHANGE ASSURANCE,

Incorporated A.D. 1720, by Charter of George the First.

Chief Office—ROYAL EXCHANGE, LONDON.
Branch—PALL MALL.

FIRE, LIFE, & MARINE ASSURANCES, on liberal terms.

Life Assurances, with or without participation in Profits. Divisions of Profits every Five Years. Any sum up to £15,000 insurable on the same Life. A liberal participation in Profits, with exemption from the liabilities of partnership. A rate of Bonus equal to the average returns of Mutual Societies, with the guarantee of a large invested capital stock. The advantages of modern practice, with the security of an office whose resources have been tested by the experience of nearly a century and a-half.

SPECIAL NOTICE.

In case of Death occurring during the Thirty Days allowed for payment of a Life Premium, and before such payment has been made, the Corporation hold themselves liable under the Policy, provided the Premium be subsequently paid on or before the thirtieth day from that upon which it became due.

THOMAS TROUTON, AGENT,
8, WESTMORELAND-STREET, DUBLIN.

MOTTU WATCHES.

WE have just received a Consignment

of the above celebrated Geneva Watches, unequalled as Timekeepers, and for their chaste design and exquisite finish. They comprise every variety of escapement, in Gold, Silver, and Enamel, Hunting and Open Cases. They have been manufactured expressly for our establishment, on Cash Terms. and we now offer them for Sale at a small profit on the first cost, and much under the price usually charged for far inferior Watches. We will give ten years' engagement with each Watch.

C. MARSH AND CO.,
Watch and Clock Makers, Jewellers, & Silversmiths
Electroplaters and Gilders,
30, LOWER SACKVILLE-STREET,
(Exactly opposite the Post-office Clock).

N.B.—Workshops on the Premises, for the prompt, efficient, and economical execution of all kinds of Orders and Repairs.

THEODOLITES, LEVELS, CIRCUMFERENTERS,

MATHEMATICAL DRAWING INSTRUMENTS, SCALES, RULES, TAPES, T SQUARES, &c.

JOHN ARCHBUTT, 20, Westminster Bridge Road, Lambeth. near Astley's Theatre, respectfully calls attention to his Stock of the above articles, manufactured by superior workmen. The prices will be found considerably lower than ever charged for articles of similar quality. An illustrated price list forwarded free on application. 8-inch Dumpy Level complete, 6 guineas; 10-inch ditto, 8 guineas; 14-inch ditto, 10 guineas; with compass, 1 guinea each extra. Best 5-inch Theodolite, divided on Silver, 18 guineas.

To Architects, Engineers, Artists, and Amateurs.

WM. M'CLEARY WIGHTMAN,

PRINTSELLER & ARTISTS' COLORMAN,
22, *NASSAU-STREET*.

Has always on hand a large and varied Stock of Drawing Materials, Paper of different sizes, Colors, Brushes, Pencils, &c., which professional gentlemen and others will find adapted to their requirements, & moderate in price.

ARTISTS' WAREHOUSE AND PHOTOGRAPHIC GALLERY,
22, NASSAU-STREET.

CABINET AND UPHOLSTERY

Manufactory, 22, NORTH EARL STREET.

Furniture and Upholstery Work of every description, neat and moderate in price. Needle Work mounted on the shortest notice. All the newest designs in Cheval Screens, Pole Screens; Ottomans, Chairs and Tables, suited for Needle Work and Potichomanie Painting, to be had at

H. P. KEARNEY'S
General Cabinet and Upholstery Manufactory,
22, NORTH EARL-STREET.

Iron Founders, Plumbers, &c.

THOMAS HENSHAW AND CO.,

(Successors to Luke Butler,
5, CHRISTCHURCH-PLACE and 16, KENNEDY'S-LANE),

Wholesale Furnishing and Builders' Ironmongers; also Manufacturing General Ironmongery and Tool Warehouse, 81, MIDDLE ABBEY-STREET — Spade, Shovel, and Tool Works, CLONSKEAGH—beg to call attention to their extensive Stock of Hardware in all its different branches, which they are prepared to supply on the most moderate terms. Iron Wire for Fencing, and Galvanized Wire Netting, at reduced prices. Agents for the Sale of THOMAS PERRY and SONS' Patent Fire-resisting WROUGHT-IRON SAFES, with drill-proof Doors and powder proof Locks. They are the best safeguards in the world against fire and thieves. On the 30th July, 1857, the above were PUBLICLY TESTED at BELFAST, in the presence of many influential gentlemen, and their superiority in resisting prolonged intensity of heat, and in baffling all attempts to effect access by drilling instruments, was placed beyond doubt. *Strength and quality considered, they are cheaper than any other made.*

⁂ Also on Sale, SAUNDERS' PATENT COOKING RANGE, which is the most economical and perfect Cooking Apparatus of the day.

IRISH BELL FOUNDRY, COPPER

and BRASS WORKS.—MURPHY, 15, THOMAS-STREET, who obtained the PRIZE MEDALS at LONDON, PARIS, and the several DUBLIN EXHIBITIONS.

EAGLE FOUNDRY AND IRON

WORKS, DUBLIN.—SHERIDAN, Iron & Brass Founder, Millwright and Engineer, has taken *Gold and Silver Medals for Superior* Church Bells.

ROMAN CEMENT, PORTLAND

CEMENT, and PLASTER PARIS STORES,
10, SIR JOHN'S-QUAY, DUBLIN.

GEORGE HOLMES and Co. are constantly supplied with the above materials of genuine quality. Also Sewerage Pipes, Junctions, Bends, &c. Agents for MAW and Co.'s Mosaic Pavements.

MINTON and CO.'S ENCAUSTIC

and other PATENT TILES, for Churches, Entrance Halls. Conservatories, Balconies, &c.; Antique, Geometrical, and Alhambric Mosaics, manufactures of highly decorative character. and extreme durability, Slabs, and Tiles for Fire-places and Hearths, Coverings for Grates, Door Furniture, White Glazed and Ornamental Tiles for Baths, Dairies, and Kitchen Ranges, may be had in great variety at their Manufactory, Stoke-upon-Trent, Staffordshire.—Designs prepared and estimates given on application to A. J. ALDRICH, AGENT, 12, TALBOT-PLACE, DUBLIN.

TO ARCHITECTS, BUILDERS, &c.

—Messrs. MAW and Co. beg to inform Architects, Builders, &c., that they have appointed GEORGE HOLMES and Co., 10, SIR JOHN'S-QUAY, DUBLIN, their AGENTS—from whom can be had designs and estimates of their MOSAIC PAVEMENTS and ENCAUSTIC TILES, now so very generally used for the flooring of Halls, Conservatories, Corridors, &c. These Pavements being "imperishable" will be found not only a highly-decorative but a most economical substitute for ordinary floors and their perishable coverings.

Benthall Works, Broseley, Salop.

J. AND E. C. REID, House, Land,

and Insurance Agents, and Accountants, 17, CHICHESTER-STREET, BELFAST.

Agents for Fire, Life, and Marine Insurances and Annuities.

STATUARY AND ARTISTS' GALLERY,
No. 192, TOWNSEND-ST., DUBLIN.
(Opposite the Theatre Royal.)

L. AND C. PEDRESCHI, Statuary

Moulders, and Figure Makers in all its branches. Figures repaired, painted, and bronzed. Alabasters—Marbles repaired and cleaned. Masks taken from living and dead subjects. Likenesses modelled in the best style of art. Centre Pieces in great variety.

⁂ Country Orders punctually attended to.

32, WELLINGTON-QUAY, DUBLIN.

V. MOSCHINI (late of G. Nannetti's,

6, Great Brunswick-street) begs to acquaint the Nobility, Gentry, and Clergy of Ireland, that he has opened the above Establishment, for the Sale of Statuary in Plaster of Paris and Portland Cement. also a great variety of Centre-pieces for Ceilings.

Masks taken after Death, on the shortest notice. Busts modelled. Country orders strictly attended to.

WALTER CARROLL & SON, Plain

and Ornamental Stucco Plasterers. 40 CAMDEN STREET, Dublin. A large quantity of Figures, Vases, Centre-pieces, &c., always on hands. Country commands strictly attended to. Architectural Designs accurately executed on the shortest notice.

Auctions, Sales, &c.

AUCTION OF TIMBER AND DEALS.

JOHN MARTIN AND SON will

OFFER by AUCTION, on TUESDAY, 11th January, in their Free and Bonded Stores, NORTH WALL, several Cargoes of North American and Baltic WOOD GOODS.

Further particulars in a future Advertisement.

JAFFRAY BARCROFT, Broker and Measurer.
15th December, 1858.

TO CIVIL ENGINEERS, SURVEYORS, & OTHERS.

FOR SALE, a 5-INCH THEODOLITE,

by Troughton and Simms, London. Price 15 Guineas. This Instrument is divided on Silver, has Tangent Screw Adjustments, Two Eye Pieces, is complete with all the usual fittings in Mahogany Case, Tripod, &c., and is in excellent condition.

To any Gentleman wanting such an Instrument, the above is confidently recommended by JOHN ARCHBUTT, 20, Westminster Bridge Road, Lambeth, London.

SAWING MACHINERY, &c., for

Sale.—A New SAW FRAME, to cut Logs 20 inches square, with Apparatus for cutting Plank; also a Circular SAW TABLE with sliding top; a 12, an 8, and Two 6-horse power STEAM ENGINES and BOILER, by SMITH, BROTHERS, and Co., Engineers, KENNING-STREET, GLASGOW, Makers of all kinds of Vertical and Circular Sawing Machinery.

APPRENTICE.—An Architect is desirous

of receiving as Apprentice a well-educated Lad having a talent for Drawing. Address, "Architect," "DUBLIN BUILDER" Office.

TO BUILDERS.—To LET for Ever,

at moderate rents, several Lots of BUILDING GROUND in HEYTESBURY, SYNGE, GRANTHAM and HARRINGTON STREETS. Apply to Messrs. PERRIN and NOLAN, Wicklow; or to JOHN LOUCH, Esq., Architect and Surveyor, 15, Molesworth-street, Dublin.

CITY OF DUBLIN IMPROVEMENT.

ON VIEW, until further notice, at

Mr. BRADY'S Commission Agency Office, No. 86, Middle Abbey-st., Mr. JOHN LOUCH'S MAP of the proposed Grand Parade, extending from Trinity College to the Phœnix Park.

THE M'ANASPIE'S,

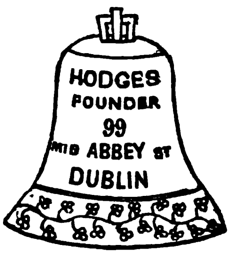
STUCCO & SCAGLIOLA ARTISTS,

Plain and Ornamental Plasterers in all its departments, Asphalté Workers, &c., have in their Factory a variety of Figures, Vases, Centre Pieces, Chimney Pots, Royal Arms, Fountains, Consoles, Busts, Scagliola Columns, Walls of Rooms, &c. Architects' Designs modelled to Design or Order, at the FACTORY, 31, GREAT BRUNSWICK-ST., DUBLIN.

P.S.—All kinds of Cement Work done to imitate the primitive stones, without colouring or painting, as patented; 16 Premium Medals and many Ordinary Certificates have been received at different Exhibitions for Works in Art, Trade, and Manufacture.

Plastering done from fourpence per yard, &c., &c.

London and Paris Great Exhibitions



Prize Medal Bells.

TO ARCHITECTS, ENGINEERS, SURVEYORS, &c.

FOR MAPPING, LITHOGRAPHY,

&c., and exceedingly fine drawing, "Tanner's Imitation Crow Quill," the most unique resplendent miniature instrument extant for above purposes—perfectly without a parallel—every pen most delicately finished at apex, by the newly-invented Catacoucha Machines—"Elastic, springy, and durable." 12s. 6d. per gross.

RICHD. TANNER, CALAGRAPH HOUSE,
16, ARTILLERY-PLACE, BUNHILL-ROW, LONDON
One Gross forwarded direct, post free.

The Dublin Builder.

Vol. I.—No. 2.

TOWN DRAINAGE.

PARIS AND DUBLIN COMPARED.

STRANGERS in Paris cannot fail to remark the channels which occasionally cross the foot pavements; for these of late years have been rather generally substituted cast-metal gutters, with a slit in the top for the purpose of cleansing. A large number of the houses in the busiest quarters are occupied in the manner which are designated as "flats," each storey being a separate domicile, approached by a stairs common to all. From each of these flats a small pipe invariably communicates with the down rain-water pipe from the roof, by which means the usual house slops and refuse water are conveyed to the gutters before described; these empty themselves into the roadside channel courses, and thence into the nearest gulley, where they fall into the public sewers, which eventually deposit their contents in the Seine.

It is by no means unusual during the day for these gutters to emit their offensive odours, greatly to the annoyance of passers-by; in very hot weather the nuisance is considerably abated by the public stand pipes being turned on.

Such is what may be designated the public sewerage of Paris! No such convenience as our house drains branching into them exists—night-soil has no access to them—therefore the Seine, unlike our rivers, is nearly as pure and limpid in its course through the city, as before its entrance thereto.

From time immemorial, the cesspool has been the only receptacle for the fœçal refuse of the inhabitants. These cesspools are of two kinds, the fixed and the moveable. The fixed, according to the provisions of a very stringent ordonnance, must be entirely composed of stone, and arched over; the entire set in hydraulic lime and washed river sand, forming a cement capable of resisting any percolation into the surrounding soil. Previously they were of exceedingly rude character, generally built of stone laid dry, and covered with timber or flags, as necessity or convenience might suggest; and possibly they were so erected intentionally, in order that the fluid contents would the more easily permeate through the surrounding strata. The moveable cesspool is generally a wooden cask, with a tight-fitting lid, through which the soil-pipe empties itself. Of late years there has been introduced a moveable cesspool, divided into two compartments—the first of which retains the solid portion of the refuse, while into the latter all the liquid flows, whence it is removed by pumping.

All the cesspools are under the strictest police surveillance, and there is a constant watch kept by this means over them to detect either effluvia or leakage. It is compulsory to have them cleansed at stated periods; but this cannot be done without the proprietor giving notice in writing, and obtaining a police certificate for the purpose.

The small quantity of water used in the Parisian water-closets, there called *cabinets d'aisances*—few of them being continuously supplied with water to turn on, as with us, and being generally acted upon by water poured in once or twice per day—may account, in some measure, for the cesspools not being rapidly filled.

There are in Paris several large companies, composed of wealthy proprietary, called *vidange* companies, who cleanse the cesspools, and derive a large revenue by the disposal of the refuse matter. There are two descriptions of apparatus in use for this purpose, some of the companies having a hydraulic apparatus, others a pneumatic; and we cannot better illustrate this portion of our subject, than by extracting verbatim a description of the process from Mr. Rammell's very able report to the Health of Towns Commission, as ordered to be printed by the British House of Commons.

In speaking of the *Compagnie Richer*, the most important of the *vidange* companies, Mr. Rammell says, "The mode of emptying the excavated or fixed cesspools adopted by this company, and indeed universally in Paris, is to pump their contents into closed carts, for transport. This operation is performed with two descriptions of pumps—one working on what may be called the hydraulic principle, the other on the pneumatic. In the former the valves are placed in the pipe communicating between the cesspool and the cart, and the matter itself is pumped; in the latter the valves are placed beyond the cart, and the air being pumped out of the cart, the matter flows into it to fill up the vacuum so occasioned; the real principle being, of course, the same in both cases, as the matter is forced up by atmospheric pressure. One advantage of the pneumatic system is, that there are no valves to impede the free passage of matter through the suction-pipe; another, that it permits the use of a pipe of larger diameter.

"The cart employed for the pneumatic system consists of an iron cylinder, mounted sometimes upon four, but generally upon two, wheels; the latter arrangement being found to be the more convenient. Previous to use at the cesspool, the carts are drawn to a branch establishment, situate just within the Barrière du Combat, where they are exhausted of air with an air-pump worked by steam-power. A 12-horse engine erected there is capable of exhausting five carts at the same time, the vacuum produced being equal to 28⅜ inches (72 centimetres) of mercury. A cart in good repair will preserve a practical vacuum for 48 hours after exhaustion. The usual capacity of both descriptions of cart is 2,000 litres, the largest size allowed by the police regulations; and the total weight, when full, 3 tons 8 cwt."

These carts are all supplied with suction-hose, which are laid from the cart at the street-door to the cesspool, already provided with an iron flange, which is unscrewed for the introduction of the hose, and the matter is pumped off without any serious annoyance either to the house or the passers-by. All carts must be fitted with an escape-pipe, by which the gases evolved in the process are burned off.

The matter thus extracted is carried either to the *voiree* of Montfauçon, situated a little to the north of Paris, or the new *voiree*, in the forest of Bondy. There, being exposed to atmospheric influence, and thoroughly drained of fluid, it is eventually converted into the highly-prized manure called *poudrette*, which yields an immense revenue to the *vidange* companies. So much for Paris!

Now with regard to Dublin!

It is really a question whether or not our sewerage, eventuating in an immense open drain flowing through the centre of the city, is at all or anything superior to the system which for ages has been adopted by the Parisians. There is no doubt but in Paris, honey-combed as it is by countless cesspools, festering in their fœtid filth, there is, to some extent, a large amount of noxious exhalation always escaping (air-tight though they may be supposed to be); but possibly, by stand pipes, which can all times be easily adjusted, and which severe police regulations compel them to have, the gases generated in them are occasionally ignited, and by the additional assistance of escape-pipes carried like our rain-water, run perpendicularly up the rere of the houses, they are either burned off or escape into an atmosphere much beyond the range of interference with health.

In Dublin we are not behindhand with regard to sewerage. We have branch tubular or other drains from all houses having any approach to respectability; these empty themselves into the Liffey, conveying their poisoned contents to the strand at Clontarf, precipitating and disseminating an amount of deleterious exhalations sufficient to vitiate the atmosphere for miles around the north-eastern suburbs of the city; cast back upon us by every returning tide along the bed of the river, and during the summer months bearing malaria and contagion in their path, which are thence wafted over the entire city.

We cannot assume an object which should be of more importance than an effort at least to remedy this growing evil. Every new district which is being supplied with sewerage—every additional water-closet erected—are but adding their quota of pestiferous contents to a gigantic cesspool in the heart of Dublin.

Certainly the expense of intercepting, by lateral cloachœ discharging into two great reservoirs, where the entire sewage could be collected, deodorized, and converted into manure, would be great at the outset; but it is more than probable eventually there would be produced (as in Paris, and why not in Dublin by a vastly superior mode?) a liberal interest on the investment. This matter has been already discussed by an abler pen than ours; we will, therefore, for the present barely direct attention to its feasibility, and return to it anon.

Dame-street in 1750.—In the middle of the last century the widest part of Dame-street, which was from Crane-lane to Eustace-street, did not exceed 40 feet in breadth; from the corner of George's-lane the street gradually narrowed to the entrance to College-green; and the intermediate portion was about 25 feet wide. The street being principally inhabited by mercers, booksellers, jewellers, and other shopkeepers, was frequently rendered impassable to pedestrians from the concourse of equipages with which, before the Union, it was usually thronged. The first step towards its improvement was made in 1767 by the removal of Swan-alley, Salutation-alley, and other old buildings at the western extremity, preparatory to the erection of the Exchange. The House of Commons having passed a resolution in 1777, that the approach to the Castle from the Parliament House through Dame-street and Palace-street was so narrow as to endanger the lives of passengers, £5,000 was granted to the Commissioners appointed by Act of Parliament for making wide and convenient passages through the city of Dublin, to widen Dame-street between the Castle-gate and George's-lane; the old Castle market was consequently removed, and the "New Buildings" were erected on a part of its site. A portion of the loan, on credit of the coal duties, amounting to £119,529 4s. 6d., was granted in 1790, to be applied to the widening of Dame-street, the Commissioners being empowered to borrow at an interest not exceeding 4 per cent. An Act of Parliament required that all the houses to be built or newly fronted, between Trinity-street and Church-lane, should be thrown back in a line with the "New Buildings" on the south of Dame-street; a similar uniformity was ordered to be observed in all new houses between Eustace-street and Parliament-street. The non-observance of this statute subjected each offender to a fine of £200, and the sheriffs were empowered to prostrate any buildings which exceeded the prescribed bounds. A total sum of £206,646 3s. was expended in the purchase of the ground and houses for opening the avenue from Palace-street to the Houses of Parliament, including, on the south side of Dame-street, the widening of Palace-street, and north end of Great George's-street, the opening of Dame-lane, Dame-court, and part of Trinity-street, and on the north side the opening of Foster-place, the widening of College-green, from thence to Anglesey-street, and part of Anglesey-street. Of the above expenditure, £82,116 18s. 6d. were paid by the sale of ground in the line of the street. The erection of the Commercial buildings on the north side of Dame-street added still further to the improvement and embellishment of the locality; and the last alterations here were made by the Wide-street Commissioners about twenty-five years ago.—*Gilbert's History of the City of Dublin.*

A new police station is to be erected near Broadford, but the magistrates have protested against the site at present selected.

ARCHITECTURAL PHOTOGRAPHIC ASSOCIATION.

The second annual exhibition of this association is now open at 5a, Pall Mall East, London, and its excellence decisively marks the success which, even at a comparatively early period, may attend the operations of a body earnestly and sincerely devoted to the furtherance of the objects for which it was established. We understand that, during the first twelve months of its existence, orders were given for, and distribution made, amongst nearly 1,000 subscribers, of photographs about £1,200 in value. The collection chosen from comprised, not only British photographs, but contributions from many of the most eminent photographers in almost every country of Europe—including Turkey, Greece, Italy, Spain, France, and Germany. In this exhibition a decided step is made in advance. Rome is illustrated in 120 subjects by Macpherson; Venice, by Cimetta; Italy, by Ponti; Spain, by Lonsada; Cairo, and Egypt, and the Holy Land, by Frith, and Robertson, and Beats. Tintern, Raglan, and Chepstow, have furnished a dozen subjects, most exquisitely photographed by Bedford expressly for the association, and Locke has taken some fine views of Salisbury Cathedral and other buildings, on a similar commission. Except Bedford, no British photographer can rival the clearness and sharpness with which the continental buildings are portrayed—in fact, the common remark of those who have visited the different localities is, that the collection takes them, in a most instructive and charming manner, over the ground again. It is proposed to give, on certain Tuesday evenings, some descriptive notices of Rome, Venice, and Cairo, as illustrated by this beautiful and varied collection. We can safely recommend our readers to become subscribers, and by payment of a trifling annual sum, they will be entitled to select subjects from those exhibited. This may be done either by deputy or personally; and to accommodate those whose avocations may not admit of a visit to the exhibition, the committee have placed in the hands of each local honorary secretary in important towns, an illustrated catalogue, classified, priced, &c. Provision is also made to suit subscribers in localities where no honorary secretaries are appointed, by an arrangement to supply catalogues direct, at a mere nominal charge of 5s.

Mr. C. Papworth, 7, Talbot-street, is the local honorary secretary for Dublin; Mr. Lynn, for Belfast; Sir John Benson, for Cork; Mr. Wm. Fogerty, for Limerick; and Rev. J. Graves, for Kilkenny.

NOXIOUS EFFECTS OF GREEN PAPER-HANGINGS.

From a communication by Dr. Alfred Taylor, to the *Medical Times* and *Gazette*, it appears that the material diffusion of arsenic in some papered chambers is now proved to demonstration.

This gentleman says:—A friend, whose library walls were covered with an arsenical-green paper, had suffered for some time from chronic inflammation of the eyes, especially affecting the conjunctivæ of the eyelids. On the discovery that arsenic was contained in the green pigment of the paper in rather large quantity, he caused it to be removed during the summer and replaced by another containing no arsenic. The inflammation from which he had suffered disappeared; but within the last few weeks it has returned. He informed me he had been dusting some books in a bookcase belonging to this room, and he imagined that the dust, which had accumulated for two or three years, had affected his eyes, and had caused a return of the inflammation. Some of the dust was carefully removed from the tops of a few books by a feather, and submitted to a chemical analysis. The dust weighed 1½ grains: it had an olive green colour, and under the microscope it presented the appearance of fibres, with numerous particles of various colours, chiefly of a greyish black. By Reinsch's process, a portion of the dust yielded a deposit of arsenic, and there was, therefore, clear evidence that some of the mineral arsenical pigment formerly on the walls had found its way through the glass doors of the bookcase, and had been deposited in the form of a fine dust on the tops of the books.

After this chemical examination, I procured from the shop of Messrs. Marratt and Short, Opticans, 63, King William-st., London Bridge, a quantity of dust for the purposes of analysis. The walls of a shop are covered with an unglazed arsenical paper; and, as I am informed, they have been so covered for a period of about three years. In collecting this dust, great care was taken not to touch the walls. The quantity thus collected for examination amounted to about 450 grains. It was nearly black, and under the microscope appeared to consist of fibres and sooty particles. It was very light and flocculent. 150 grains of this dust were examined by Reinsch's process; and enough metallic arsenic was obtained from it to coat about ten square inches of copper foil, in addition to a piece of copper gauze. From the latter deposit, by the application of heat, octahedral crystals of arsenic were readily obtained. The cases had not been dusted for a period of nine months.

The cases are secured by glass doors, and lined inside at the back with arsenical paper. Mr. Short removed, by a camel's-hair pencil, a small quantity of dust which had accumulated on the thermometers and barometers, which are locked up within the closet. The quantity thus obtained from the projecting parts of a few instruments amounted to eight-tenths of a grain, of which five-tenths were taken for examination. This half grain of dust sufficed to cover pretty thickly with metallic arsenic a square inch of copper gauze. A portion of this, when heated, yielded a large number of well-defined octahedral crystals of arsenious acid.

These facts lead to the inevitable inference that the air of a room, of which the walls are covered with an unglazed arsenical-green paper, is liable to be charged with the fine dust of the poisonous aceto-arsenite of copper. Those who inhabit these rooms are exposed to breathe the dust. The poison may thus find its way by the pulmonary membrane into the system, or it may effect the eyes, nose, and throat by local action. That so few cases of actual poisoning under these circumstances have occurred is a fortunate circumstance; but only cases of serious mischief would be likely to attract attention. There may have been numerous instances of a disturbance of health, depending on this arsenical paper, which from absence of suspicion has been assigned to other causes. The degree of exposure, state of health, peculiar susceptibility, and the eliminating power of the system, may account for the comparative rareness of these cases. The mode in which the pigment is laid on the paper may be such as to prevent, in some instances, the fine particles of dust from escaping. The fact now demonstrated, that arsenical dust is, and must be, substantially breathed by those who occupy rooms thus papered, explains the similiarity of symptoms observed; justifies the statements made by Dr. Hinds, Dr. Halley, and others; and proves that those who have experimented on this subject with negative results have not taken the right course to arrive at the truth. Their results have, to a certain extent, misled the public, by teaching them to rely on what is now proved to be a false security.

If, as a general rule, the quantity of arsenic which can penetrate the body from this course is small, it is still desirable that arsenic should not be breathed day by day in any proportion. The defenders of this noxious manufacture will hardly go the length of asserting that this arsenical-green, which is a potent poison in the stomach, can exert no injurious effect when taken into the lungs; and yet, unless this assumption be made the inevitable inference is, that these papers should not be used for covering the walls of our dwellings.

ARCHITECTURAL COMPETITIONS.*

WHATEVER may be said in favor of the *principle* of competition, very certain it is that the present system of architectural competition is rife with so many abuses, so many grievances to the profession, as to require a thorough reform. There is more of plausibility than of truth in speaking of it as inciting to that generous emulation among the followers of the art which is calculated to conduce to the advancement of the art itself. In that respect practice completely contradicts theory, it being undeniable that competitions of the kind, conducted, too, in the very suspicious manner in which they now are, almost invariably occasion jealousies and heartburnings, and sometimes open complaints also. Some will say that those who disapprove of competitions need not enter them. Direct compulsion to do so there certainly is not, yet there surely exists an indirect one of no inconsiderable force; because, instead of being reserved for extraordinary and worthy occasions, architectural competitions have of late become almost the exclusively established mode of obtaining designs for any public building, no matter how unimportant it may be, how small the sum to be expended, or how contemptibly paltry the premiums which are held out as baits; one consequence of which is, architects are consequently brought into hostile collision with each other, not openly, indeed, but not therefore the less unfriendly; another, that notwithstanding the specious argument of competition being calculated to draw out talent, and afford opportunities of distinguishing themselves, to those who are unknown to the public, there is quite as much to discourage those who have already an established practice of their own, and deter them from letting go the substance in order to grasp at a *mere shadow*.

How competition works for the profession is tolerably apparent from the fact that it extorts from them a vast amount of labour and time, to say nothing of incidental expense also, which is utterly thrown away. Although only one design can be made use of, fifty sets of drawings are perhaps sent in, and there has in some instances been nearly double that number. One of the rejected obtains a so-called second premium, and it is well if it be such as to repay its author for his trouble and anxiety. As to the rest, they are returned to those to whom they respectively belong, without either comment or compliments, be their merits what they may. Could it be accurately ascertained, the number of drawings which are annually produced without other effect than that of encumbering the portfolios in which they are entombed, would be absolutely startling, and would go far towards proving what an enormous tax competition imposes upon the majority of those who enter into it. Surely it ought to be sufficient to ask in the first instance for mere pencil sketches, a design from which being selected, the finished drawings would afterwards be made? Why should carefully made out drawings be required, when the most elaborate productions of the kind are—if not made use of for the express purpose they were intended for—positively valueless, at least of no money value, being quite unsaleable? A picture of a pigstye, or of a couple of filthy beggar boys, may be hung up in a drawing-room, without any imputation on your taste; not so an architectural drawing, not even a perspective one, no matter how charming the subject or how artistic the treatment, and notwithstanding that it ought to possess a double interest, as combining attractiveness of pictorial execution with the display of architectural forte. Wherefore such is the case, this is not the place to explain; but that so it is, is unhappily too true, since it says very little for the appreciation among us of architecture as art, unless presented in the matter-of-fact shape of actual buildings, and even then it is generally estimated according to its most prosaic and matter-of-fact qualities.

In like manner, as the statistics of competition would render evident the immensity of the tax levied upon the profession, giving us to see how many thousands and tens of thousands of drawings are produced in the course of a few years to no purpose whatever; so would the secret history of competition, were it obtainable, bring to light some strange and not a little ugly facts also. Even what has already partially transpired, in some instances goes far to convict competition committees of what looks like bad faith, and not unfrequently of utter incapacity also. This may sound very uncharitable, yet those who, instead of taking any pains to avert suspicion, conduct their proceedings with such suspicious secrecy cannot reasonably complain if they be suspected of mal-practices. Wherefore such studied concealment, if there be nothing to conceal, nothing to be ashamed of?

Secrecy and irresponsibility are a most foul plot upon the present system of architectural competition; secret tribunals and masked judges are utterly abhorrent to English feeling and English practice. Of course any committee or public body may, just like a private individual, go to an architect and employ him, without being answerable to any one for what they do. Widely different is the case when architects are invited to public competition by public advertisement; and those who send in designs under such circumstances are rightfully entitled to some far better guarantee for fair dealing than the presumptive integrity, and the equally presumptive capacity of judges who, instead of sitting in an open court, closet up and screen themselves behind a curtain. Nothing, however, is suffered to transpire but what cannot be concealed, namely, the final decision, which, if committees are not belied, is not unfrequently what they have most to be ashamed of. In his address to the Institute of Irish Architects, the late Sir Richard Morrison said that, from among designs sent in to competitions, he had known the worst to be sometimes chosen; and, indeed, some of those which have found favour in the eyes of the committees are so exceedingly unsatisfactory that hardly can we suppose them to have been the best offered, without also supposing that there must have been a lamentable lack of talent on the part of the competing architects. The Rejected Addresses have afforded the public no little amusement, and a collection of Competition Designs would perhaps cause them, if not much amusement, a great deal of astonishment, and render them not a little sceptical as to the advantages accruing either to the profession or to architecture itself, from the present system of competition. One most undeniably it is that invests perfectly irresponsible, and, for aught that is ever shown to the contrary, very incompetent individuals too, with not to be questioned authority, and accordingly the power of committing irreparable mischief with perfect impunity. That, unless some very underhand doings are going on, it is the intention of a committee to make choice of what, in their opinion, is the best design submitted to their judgment, may reasonably enough be supposed, yet what avails that and all their good intentions of acting for the best if their judgment itself be defective? Gentlemen may be all honourable men, and what in common parlance are styled "highly respectable men," influential ones also, as being baronets or bankers, mayors or magistrates, persons of ancient or new-baked and money-making aristocracy. Granting, however, that they are not only unimpeachably "respectable," but persons of intelligence also, and sincerely well-meaning, such recommendations ought to go for nothing, if they be at the same time deficient in the main qualification which the actual occasion requires, namely, competency of taste and judgment with regard to architecture. Among the persons who sometimes decide the fate of Designs, there is perhaps hardly one who, at any other time, would venture to express an opinion concerning architecture, or whose opinion, if expressed, would be in the least regarded. On the contrary, were it asked, the reply would most probably be, "I do not profess to be any judge of architecture," a confession that may be heard almost any day in highly respectable society, and in circles where matters of art and taste are fluently discussed. Nevertheless it seems that individual ignorance becomes collective sagacity, when its items are added together into the formidable sum total of a committee, armed with authority that may not be questioned, and fenced in by impenetrable mystery. *Defendit numerus:* association inspires them with confidence, more especially as there are no listeners to overhear their arguments. There are other Pecksniffs besides professional ones, even Pecksniff committees. Nor are they a whit the less Pecksniffian in their constitution; for, being dressed out in "a little brief authority," arrayed in which they play "antic tricks," which cause, not, indeed, angels, nor perhaps architects, but architecture itself to weep, and its friends to groan.

---

* By W. H. Leeds, Esq., and published in the Proceedings of the Liverpool Architectural and Archæological Society.

According to the manner in which committees are constituted, architects have not the slightest guarantee for either good faith or discernment on the part of their self-elected and unknown judges. Persons who perhaps scarcely understand the nature of technical architectural drawings at all, who never before gave aught of attentive consideration to any, and who are utterly incapable of putting together in their own minds what is described separately in plans, sections and elevations, so as to form a clear idea of the entire design so represented,—undertake, without the slightest misgiving as to their own sufficiency, to pass a judgment upon a perplexing number of designs, the poorest of which present, probably, some good points to recommend them, while the best may be open to objections,—which by being adroitly magnified, and astutely represented as insuperable, may cause a very superior design to be set aside for a mere common-place one, and as such quite *safe* and *secundum artem.* To go through a score, or, more likely, double that number of separate designs,—to compare and confront them impartially, to weigh all the conflicting *pros* and *cons*, would be, though perhaps a pleasure in itself, no brief one. Nevertheless, self-elected, and, no doubt, also Heaven-enlightened committees, make very short work of it. How they contrive to do so, is a matter as to which they keep us quite in the dark; and so long as it pleases them to do so, there will be abundant room for mistrust and suspicion.

It is important that the public should be informed of more than the bare result of a competition, since hardly can the decision be in every instance a unanimous one. Not only may it happen to be carried by a very small majority, but the superior judgment and the better argument may be on the side of the minority. It may be questioned, however, whether aught deserving the name of discussion takes place, there being nothing to show that it does, nor any reasons adduced to justify the choice determined upon. They may, however, be allowed the advantage of a doubt, although to give them credit for exercising all requisite discrimination excites all the greater regret that the public should not be allowed to profit by the opinions elicited on such occasions, and by the various *pros* and *cons* brought forward on either side. Justice towards competitors absolutely demands disclosure of the kind, because hardly is it to be imagined that among the rejected there has not been a single design of sufficient merit to obtain any approbation at all. The criticism which might be so elicited is, too, all the more desirable, because, as far as the works of contemporaries are concerned, criticism appears to be completely ignored; a strange way by-the-by, of encouraging talent, if only because it holds out impunity to the want of it. Suspicion may be illiberal—in some instances, perhaps, unjust; still it is unavoidable where the obvious and most effectual method of guarding against it is studiously resisted. Where all is calculated to excite it, there will ever be mistrust; nor is it to be denied that unworthy influences have occasionally prevailed over both justice and a due regard to the interests of art and to the credit of our national taste. At all events, it is difficult to believe that some adopted designs could have been the worthiest of those sent in. A collection of Rejected Designs would probably at once edify and scandalize the public. Even from the little that is already known it is very evident that irresponsibility for, does not carry along with it infallibility of, judgment.

The best that can be said in favour of it is, that the inviting architects to what is rather ironically called *open* competition, has the specious appearance of acting liberally towards them, with the sincere desire of obtaining a superior design; the opportunity being so afforded of comparing a number of them all produced for the same purpose. Ample latitude of choice is no doubt convenient and agreeable enough; but it should be recollected that it is furnished at the cost of those who compete, and who have not in return either any valid pledge beforehand that justice will be, or after assurance that it has been, done them. Indeed, there have been strange stories afloat ere now of competitions being got up as a mere blind, and in deference to the wishes of town's people, the eventual decision being all the while snugly settled. It is more decent, however, to suppose that such truly perfidious and fraudulent practices must be altogether imaginary. Little need is there of imputing intentional fraud to those who undertake the management of competitions, when even intending for the best, and acting honourably, they generally contrive to frustrate their avowed and in itself laudable purpose, at the outset. Instead of being full and explicit, the instructions given for the guidance of architects are oftener than not so exceedingly vague and indefinite, that those who prepare designs from them are obliged to work all but entirely in the dark and at hap hazard. In case of a private employer, a professional man has the very great advantage of being able to ascertain what is really required of him. He has the opportunity of conferring immediately with the party whose wishes and taste must be complied with;—of advising, recommending, dissuading, as there may be occasion for doing;—whereas in the case of competitions it is all hit-or-miss—a mere random shot in the dark.

That committees should of themselves be able to draw up sufficiently accurate and detailed instructions to competitors, is hardly to be supposed, yet that difficulty may be easily got over at any time by the equally simple and obvious expedient of employing some competent person to do it for them. Besides which it would be but ordinarily prudent and sensible to allow considerably longer time than is usually done for the preparation of designs. The absurd hurry with which they are frequently asked for, occasions no small inconvenience to those who have to do with competitions, since it imposes upon them the harassing and worrying exertion of working against time, or the necessity of having recourse to extra assistance, to be paid for out of their pockets. On the other hand, such uncalled-for precipitation on the part of the committees is at variance with their own interest. How can well-studied and carefully-considered designs be produced if the time allowed be little more than barely sufficient for the mere manual operation of preparing the requisite drawings? The consequence is, first ideas, however crude or common-place, are per force adopted, and though the drawings themselves may be ably executed, designs are sent in "with all their imperfections on their head." The hardship thus imposed upon architects is all the more provoking when, as has been the case more than once, it afterwards turns out that the committee themselves are in no hurry at all to commence building operations. Not very many years ago there was a rather important competition for a large public building, the designs to be sent in within three months from the date of the first notice of it. Two premiums were offered and paid; yet, as to the building itself, not a stone of it is yet laid; for, marvellous to relate, it was not till after the competition the committee discovered that they had no funds even to begin with! It must, however, be confessed that that affair took place in the sister isle.

Of architectural competition as now conducted, the main errors and defects have been here animadverted upon, not more severely than was necessary, and in such manner, too, it may be presumed, as at the same time to render sufficiently evident how they might be remedied. The most odious feature of all in it is, the impenetrable secrecy thrown over the proceedings in the committee, as if they were nothing less than Eleusinian mysteries. Nor is it the least of the evils attending such secrecy, that it encourages incompetent persons—persons at least who shrink from giving any pledge of their competency—to interfere and pretend to manage what requires from them both taste and judgment. That justice should be blind is a long established and respectable notion; but we have yet to learn that judges and judgments should be equally blind, too, and that the public should be blindfolded into the bargain, as is now done in the case of architectural competitions.

Not the evils and hardships only of the present system, but also the remedies for them, have now been pointed out; there still remains, however, what many or most may consider a very embarrassing, if not wholly unanswerable question: How are the remedies to be administered? What if the patient strenuously refuse to swallow the salutiferous medicaments? Why, if he refuses to be coaxed into doing so, he must be awed into it; and there exists, fortunately, in this land, and in these times, a power which, duly exerted, is capable of awing the objects of it into compliance, however reluctant it may be, with its demands—namely, the force of public opinion.

The enlisting public opinion on their side in opposition to the petty, yet not therefore less vexatious and oppressive tyranny of what have been called "hole and corner committees," depends upon, and must be left to architects themselves. Unless they choose to bestir themselves and make some decided effort to shake off the yoke, they must continue to submit to it; possibly without thereby incurring any reproach, most assuredly without being entitled to any compassion, and the pity which would be ill-bestowed upon its pusillanimous followers, may be more justly reserved for architecture itself.

We understand that the Board of Public Works has refused to sanction the appointment of Mr. Long, C.E., as resident engineer of the Port of Limerick.

TURKISH BATHS IN IRELAND.

(Continued from page 8.)

The *Fermanagh Mail* thus describes one of these baths, on the borders of Fermanagh and Leitrim:—

"It is built of stone and mortar, and brought to a round top. It is sufficiently large for one person to sit on a chair inside, the door being merely large enough to admit a person on his hands and knees. When any of the old people are seized with pains they at once have recourse to the sweat-house, in which is placed a turf fire, which is left till burnt quite down, the door being a large stone, and air tight, and the roof or outside of the house being covered with clay to the depth of about a foot, to prevent the least escape of heat. When the embers are taken out, the floor is strewn with green rushes, and the patient is escorted to the bath by a person carrying a pair of blankets. The invalid creeps in, places himself in a chair, and remains till perspiration rolls off freely. When sufficiently operated on, the person in waiting swaddles him up in the blankets, and off home, and then to bed."

There is another bath at Mount Keeper, County of Tipperary. The Lacedemonians, who considered warm water as enervating, used two kinds of baths—namely, the cold *daily* bath in the Eurotas, and a *dry* sudorific or vapour bath, in a chamber heated with warm air by means of a stove. A sudorific or vapour bath is mentioned as early as the time of Herodotus. The vapour chamber is almost universally used in Hindostan and throughout the Russian Empire, whilst vapour *boxes* and warm-water baths are more used in Western Europe. The Romans carried bathing to great perfection, having five or six chambers in their public *balneæ*, called *thermæ*, supplied by splendid aqueducts, and including gymnasia, walks, lecture-rooms, &c. Remains of Roman baths are common in France, and are also to be seen at Bath, Hovingham, in Yorkshire, and Chester, where the *hypocaustum præfurnium* and cold plunge are in excellent preservation. I have also visited the "Palais des Thermes," in Paris, which is entered from the Hotel de Cluny, and faces the new Boulevard de Sevastopol. In a recess off the principal apartment is a large piscina for cold water, somewhat like that of the Northumberland Baths in this city, and which was made use of after the warm bath, to astringe the pores and produce vital reaction. This is the only important part of the Roman bath which the modern Turks do not copy, although I am informed that the baths at Cairo are provided with them; but in general the Ottomans content themselves with thorough washing by soap and water, and throwing bowlfuls of warm water over themselves. They consider these processes, however, as only accessory, the heated chamber itself being the main thing, without which there can be *no bath*.

In the cooling room, or *frigidarium*, couches are provided, where the clothes are laid and the bathers recline after coming out of the heated rooms, in which shampooing or gentle kneading of the muscles is performed. The use of shampooing, as practised in the Turkish bath, is to accelerate the flow of perspiration. There is a popular delusion respecting the temperature maintained in the Turkish bath, because of freer perspirations; but this is quite incorrect. A hot-air bath is not comfortably warm at 98 degrees, and anything lower will be rather hurtful than otherwise. Drs. Watson and Erasmus Wilson record cases of persons entering ovens heated sufficiently to cook beefsteaks and other articles of food which they took in along with them.* But although the safeguard of cooling by evaporation does exist in the hot-air bath, and constitutes one of its advantages over all other baths, we find that these high temperatures are *never* used by the Turks, simply because they are unnecessary, and the heat communicated to the body is thus absolutely less than in any other kind of bath. There is no other kind in which accidents are less liable to happen, if superintended by a competent person; nor is there any other in which it is possible to remain so long with impunity.

[Note—We understand that the arrangement and design of the proposed baths, on the Turkish principle, about to be erected at Bray, as mentioned in preceding No., is due to Mr. Barter, of Cork.—ED.]

IMPROVEMENT OF PORTRUSH.—This town has rapidly increased under the auspices of Mr. Dargan. It was originally called Skerries, from the curious rocky islets opposite. There was anciently an abbey and monastery here; and two miles to the south is the old church of Ballywillan, in good preservation, and a fine example of 12th century architecture. Near this is a fine specimen of the primæval Irish pillar stone, marking some chieftain's grave. This, with the old church and wonderful basaltic colonnade of Craigahullar, are within a few perches of each other.

ARCHITECTURAL NOTES IN LIMERICK.

EVERYONE who has visited "the Citie of the violated Treatie," even casually, must admit that, in point of position "on Shannon's banks," and in the arrangement of its thoroughfares, it may rank with some of the principal in the United Kingdom. The public buildings of any artistic excellence are not very numerous, though its cathedral is, perhaps, one of the most venerable and noble ecclesiastical structures in Ireland, and the recently-erected St. John's Church, after a design by Mr. Welland, and the now nearly completed Roman Catholic cathedral of St. John, designed by Mr. Hardwick, R.A., are edifices of a very important character, and contribute greatly to the beautification of the city. George's-street is the principal and a noble street, and although a fine business thoroughfare, is a fashionable promenade at a certain hour of the day. Of late years, the street architecture has been much improved, and we feel pleasure in recording a few particulars of the most recent.

Messrs. Cannock, Tait, and Co.'s premises occupy a plot of ground 210 feet long by 125 feet extreme width, the frontage towards George's-street being 66 feet. They have been almost completely rebuilt during the past year, on the entrance into the firm of Mr. Peter Tait, the eminent contractor for army clothing, whose evidence before the Royal Commission on Army Contracts has been recently published, and has attracted much attention.

The greater portion of the space is but one storey in height, roofed with lantern lights towards the north, as in the large Dublin house of Cannock, White, and Co., of Henry-street. The front and some of the rere buildings are of two or three storeys, the upper storeys being appropriated to kitchen, dining, and sitting rooms, library and sleeping rooms, for the assistants. The ground floor is laid out in the departments customary in such establishments, there being two shop-doors, with large glazed porches, mahogany swing-doors, &c. The entrance to the house and for the assistants is on Honan's-quay, some distance from the front.

The front is divided by pilasters and engaged columns into eight bays or upright divisions, and is of three storeys in height, there being a "mezzanine" or "entresol" immediately over the shop windows, and included under the shop cornices. Six of the ground-floor bays, between the pilasters, are glazed with single panes of plate-glass, each pane being nearly 13 feet by 7 feet—the remaining two forming the entrances. The whole are protected by Bennett's patent interlocking revolving shutters. The horizontal transom over the shop and under the entresol windows is divided into a series of eight panels, illuminated and glazed over the colouring, the name and initials of the firm and various floral devices being introduced. The two extreme pieces are boldly rusticated, and the shop entablature enriched with consoles, panels, lions' heads, &c.

The upper portion of the front is treated after the Venetian manner, with engaged Ionic and Corinthian columns and arcuated fenestration, the main cornice being of considerable projection, and an arched balustrade, with large vases and terminals, at the top. The two flanks are treated in a corresponding style with the front, as they rise considerably over the adjoining houses, and the chimney-shafts are panelled and corniced, so as to form effective features. The whole of the front is executed in Portland cement; and the windows throughout glazed with plate-glass.

The architects employed were Mr. Gribbon, of Dublin, and Mr. W. Fogerty, of Limerick, the principal part of the work having been contracted for by Mr. Quin, of Dublin, and executed between the 1st of February and 1st of May, 1858—extraordinary efforts having been used to complete it in time for the spring season. The entire cost, including fixtures, plate-glass, shutters, and new wholesale and carpet rooms, &c., since being added, will amount to about £9,000.

The premises of Messrs. James Hogg and Co., next door, have also been remodelled under the direction of Mr. W. Fogerty, who has also directed extensive operations to the premises of Messrs. Thomas Revington and Co., nearly opposite, which works, with those already described, have greatly enhanced the effect of the principal street.

In addition to the foregoing, we may mention that the Guardians of the Limerick Union have contracted for the formation of a chapel for the use of the inmates of the workhouse, by increasing the length of one of the large school-rooms, with open timbered roof, and fittings, &c. Mr. W. Fogerty is the architect; Mr. Day, contractor. Amount, £540.

A new apsis or chancel has been added to the Asylum Episcopal Chapel, now called Trinity Church. It is semicircular on plan, with vaulted and panelled ceiling, and panelled sides, having three arched windows, with mullions and circular tracery. The arch between church and chancel springs from detached Ionic columns, on pedestals, with enriched entablature and coffered sides to the arch. The interior of the chancel is intended to be illuminated, and the three windows filled with stained glass. The cost of the works has been about £500. Mr. W. Fogerty, architect.

---

* What figure do they present when they come out?

MIDLAND GREAT WESTERN RAILWAY.

LIFFEY BRANCH.

In our last number we drew public attention to the proposed extension of the Midland Great Western Railway by a branch from that line to the North Wall Quay.

Of the utility and the advantages of such a branch, nobody, we believe, is willing to entertain a doubt. But it is of paramount importance that a public undertaking of this nature should be constructed, as far as possible, without unnecessary injury to the properties of private individuals, or, what is of greater consequence, the general requirements of the traders and public of the city.

As regards the construction of the branch from its junction with the main line until it arrives at Sheriff-street, no impediment to public traffic or injury to private interest presents itself.

Here, however, the difficulty occurs.

By the plans lodged it is proposed that the line shall cross Sheriff-street, on the east side, at a distance of a few yards from the centre of the present canal bridge, and that a new stone bridge be placed over the canal, the rails to be five feet below the level, thereby necessitating the roadway to be carried over the railway by an arch at an altitude of 11 feet from the present coping of the canal, and consequently 16 feet from the level of the railway. Omitting the injury to private individuals (the owners of property in that locality), we prefer referring to the serious difficulties presented in the way of public traffic. Sheriff-street is the leading thoroughfare to the Graving Dock (that grand and noble structure, a lasting credit to our city, constructed by the Ballast Board according to the plan of their able engineer, Mr. Halpin), and as such must necessarily be a street of great importance; and, in fact, if the dock be used to an extent that its dimensions merit, we hope that steamers, even of the largest class, may be safely laid up there for repair, and our readers will at once feel convinced that in such case the difficulty thrown in the way of the enterprising proprietors of the Seville Iron Works and of other like establishments, in the transmission of the heavy machinery belonging to such vessels, will prove not only a private loss to deserving citizens, but a very serious injury to the commercial shipping enterprize of our city.

We need not individualize the case of our prince merchants, Messrs. Martin, whose business would be most seriously injured, if not completely destroyed, in the event of the interruption, by repairs or otherwise, of the North Wall Quay, as in such an event (their heavy trade being between the canal bridge and the North Lighthouse, and where they have lately erected their most extensive steam saw mills), Sheriff-street would be then the only passage to either their shipping or their works, and the altitude of the proposed bridge would present such a difficulty as would prove almost an insurmountable barrier to their trade.

So strongly were some of the citizens impressed with the injurious effects of the proposed line, that they waited on Mr. Hemans, the engineer of the company, to represent their objections to him. Mr. Hemans received them with his usual urbanity and courtesy, and entered fully into the subject. After much consideration, he stated that he would recommend the Railway Company to construct a level swivel or pontoon bridge, somewhat similar to that at the Broadstone, and candidly gave his opinion that such a bridge would prove to the advantage also of the company, as it would enable them to convert that vast portion of the Royal Canal between Sheriff-street and the Drogheda Railway into a floating dock, for the moorage of vessels with coal and lighter burdens.

Were no other object to be attained, we consider that our fellow-citizens would feel rewarded by having a harbour for colliers at the north side of the city, thus materially lessening the traffic over Carlisle Bridge, and substantially assisting the inhabitants at that side of the river.

Fortified with this approbation of the Railway Company's Engineer, a memorial was prepared, and in the course of a few hours was presented to the Committee No. 1 of the Corporation, signed by the leading merchants of the city. The opinions of Mr. Lefanu and Mr. William Dargan, probably the first engineers in this or any other country, were also solicited on the matter, and they fully coincided with the representations set forth in the memorial.

The Committee No. 1 of the Corporation, in compliance with the memorial, received, on Saturday, the 22nd of January last, a deputation of the citizens interested in the matter; and it is subject of remark that so great was the interest felt that almost every member of the Corporation was present. Mr. Francis Codd, T.C., presided at the Committee. He was most strongly opposed to the views of the deputation, conceiving that merely private interests were concerned. However, after a most lucid explanation of the plans, &c., made by Mr. C. W. H. Archer, who acted as spokesman of the deputation, and after consultation with the City Engineer, the Committee unanimously acceded to the views of the deputation, and approved of the level crossing at Sheriff-street, subject to the conditions of the Railway Company being obliged to construct, in addition to the bridge proposed by them, two other swivel or pontoon bridges—one to connect Mayor-street, and the other on the North Wall Quay.

This approval of the Committee No. 1 is doubly valuable for the reason we have above mentioned—namely, the bringing to the mind of the respected chairman a conviction of the soundness of the views of the deputation—a gentleman whose name and fame in the commercial world has already been fully established, and whose concurrence stamps, far more than any remarks of ours can do, the *bona fides* of their representations. We may remark, *en passant*, that the anxiety evinced by the Corporation in this matter proves that they are not careless or inattentive to the interest of their fellow-citizens, notwithstanding the ill-founded complaints that are made against them.

The matter so remains. We have not heard whether the Railway Company are willing to subscribe to the conditions imposed upon them by the Corporation. We sincerely trust that they will, or at least that these bodies will arrive at some amicable understanding. The Ballast Board, we are sure, will not throw any impediments in their way; but in the mean time it is clearly the duty of the citizens to bestir themselves, and to take care that by their lukewarmness and neglect a sad and grievous injury may not be inflicted in our city, which it is easy now to prevent, but which, to quote from Mr. Lefanu's report, "if now permitted, will be hereafter impossible to remove, and will be regretted by all when it is too late."

A RAMBLE IN OUR CEMETERIES.*

Could we divest ourselves of associations connected with localities, we should designate Mount Jerome a delightful suburban retreat; but the mournful *cortéges* which may be seen each morning pursuing their silent way towards its gates, remind us that here, too, is a last resting-place of humanity, where old and young—rich and poor—sooner or later, are destined to repose. This cemetery is situated at Harold's Cross—a village about three miles south of the General Post-office, and on the high road leading to Rathfarnham—whose history is identified with some of those bloody conflicts which occurred during the period the Danes were in Dublin, and Dalton says that the Archbishop of Dublin, "in right of his palatine of the liberties of the Cross," had a gibbet here. In 1836, a project for the formation of a company of shareholders to establish a cemetery at the south side was matured, and the area now occupied by "The General Cemetery Committee," as it is entitled, comprehending 25 acres 2 roods and 26 perches, was decided on. At first it was but a wild, hilly, and deserted-looking tract, but has been gradually subjected to much improvement, and symmetrically laid out, with radiating gravelled walks and undulating slopes. Comparisons, they say, are odious, but it is a notable fact, that an equivalent amount of taste and care has not been bestowed here on the landscape gardening of the grounds, or the decoration of the graves, as at Glasnevin. This, however, is in a measure accounted for by "difference of opinions," the majority of those interred there being in principle more averse than others to such display. The approach to the cemetery is through a handsome iron-railed gateway, having Gothic cut-stone piers, and a Tudor lodge at one side, designed by Mr. Louch, who was also architect to the church at the other, which, however, is in no way connected with the cemetery. Facing the entrance, and forming a termination to the main walk, is the principal gable-end of a tasteful structure, in early Gothic style, composed interiorly of a nave, separated from side aisles by piers and arches, open timber roof, stained and varnished, and used as a chapel for the performance of the burial service. Mr. William Atkins, of Cork, was the architect. This chapel is decorated with mural tablets, and has a handsome entrance doorway, with traceried window, filled with stained glass, immediately over. We should specially notice the altar-tomb, designed also by Mr. Atkins, and erected to the memory of the Collins family, as a work of considerable merit; as also the slab placed by the chairman and committee of the Great Industrial Exhibition of 1853, in commemoration of the late deputy-chairman, Major Fairfield, and the important services rendered by him on the occasion of that great national undertaking.

Burial-service may be read by the minister of any Gospel, but the committee only permanently engage a Church of England clergyman for the purpose. On one occasion, we understand that the Roman Catholic service was performed in English over the grave, and that interments of Roman Catholics frequently take place here, though it is erroneously believed by many that exclusiveness is observed.

---

* See page 5 *ante*.

About 16 acres are devoted to perpetuity ground—*i.e.*, that the entire grave must be purchased to admit of one interment, but may be re-opened, by permission of the purchaser or his representative, until filled—the cost being £4 2s. 6d., and each grave averaging five bodies. When larger space is required, it may be obtained at the rate of five shillings per square foot. To ensure the more perfect stability of the underground works and efficient drainage (to which peculiar attention seems to have been successfully paid), the right of constructing such works is reserved by the committee, who engage their own workmen, and charge according to measurement by schedule of prices, or by bulk sum as per agreement; but as regards monuments, headstones, &c., it is optional with the public. Another portion of the space beyond the circle, at which point terminates the perpetuity ground, is appropriated for those where the privilege of erecting headstones is reserved, and here the cost of each interment is £1 2s. 6d.; but close by is an extensive plot for those where the privilege is not desired, and where 12s. 6d. only is the charge.

Up to the time we write, about 16,250 bodies have been interred! If Mount Jerome cannot boast of containing the ashes of such men as the O'Connells, Curran, Ruthven, or John Hogan, it may proudly claim, notwithstanding, to be the repository of a goodly host of our greatest legislators, scholars, artists, wits, and merchant princes. Perhaps the most striking monument to the eye of a casual visitor is that of the late Mr. Drummond, M.P., Under-Secretary, being surmounted at a considerable height by a large sarcophagus, with a massive tapering pedestal beneath, forming the walls of the vault in which are contained the remains. Wandering amongst the more important vaulted tombs, our eye rested on the names of Lord Plunkett, Chief Justice Bushe, Mr. Justice Moore, General Sir George Cockburn, Thomas Gresham, the late Provost Lloyd, Sir Philip Crampton, Professor M'Cullagh, and others distinguished respectively for their literary, scientific, or philanthropic attainments, and who, though silently reposing in their tombs, are and must perpetually remain alive in the mind of admiring posterity. Amongst those whose avocations during life were more immediately identified with the ordinary readers of our Journal, we must not fail to particularize the names of Sir Richard Morrison, William Vitruvius Morrison, and William Farrell, architects; Arthur Williams, builder; Isaac Weld, M.R.I.A.; Robert L. West, Thomas J. Mulvany, and Thomas Kirk, R.H.A.'s; Thomas Davis, the poet, of whom a colossal marble statue by John Hogan, executed in that artist's usual exquisite style, stands immediately over his grave. Here, too, have we poor "Terry Driscoll," whose hand, wittily and humorously, wielded the pen from an imaginary "Stoneybatter," and is now and for ever chilled by the icy coldness of death—his grave marked by a small but appropriate headstone, with a sculptured figure of Hibernia weeping over an urn, from the chisel of Mr. Joseph Kirk, R.H.A., who has also executed some other monuments in this cemetery. Strange reflections respecting the uncertainty of life, and the folly of devoting one's existence to the earnest pursuit of worldliness and the accumulation of wealth—to be parted with at the door of the tomb—though sought after as if of eternal duration, suggest themselves while rambling in a cemetery; for there do we find for ever laid low those whom as if 'twere but yesterday we met in the ordinary course of business, or mixing amid a gay throng in festive halls. Such feeling must all experience while noting the resting-places of the Pims, Perrys, Guinnesses, Harvies, Findlaters, and a host of others who but recently have quitted this busy world, leaving vacancies to be filled by some who in their turn must again yield to others, and who, doubtless, will worthily perpetuate their honoured names. It would be impossible for us to notice every object of interest in this cemetery, or to name every notable person interred there; but we must *en passant* remark, that many of the monuments are of a massive and superior class, partaking more of a mausoleum character than is observable elsewhere—though occasionally may likewise be found draped figures, broken pillars, terminating vases, &c.—and for its extent it comprehends proportionately a greater number of remains of those with whose names our citizens were more publicly familiar than are to be found in similar establishments.

In drawing this brief history to a close, we must not fail to pay willing tribute to the courtesy of the officials of both cemeteries, who kindly and in a painstaking manner afforded us the fullest information in their power, and which is a pleasing circumstance it does not *always* fall to the lot of a journalist seeking information from public bodies to chronicle.

BOARD OF TRADE RETURNS.—We find by these that the exports of iron during November, as compared with the corresponding months in the two preceding years, were as follows:—

		1856.	1857.	1858.
Pig Iron	...	119,802	108,919	59,537
Bar Iron	...	454,733	388,892	395,436
Wrought Iron	...	329,410	321,454	245,494

PROPOSED WIDENING OF CARLISLE BRIDGE.

THE fact, though curious, is nevertheless true, that every person, whatever may be his occupation, considers he has *some* knowledge of engineering and architecture, or at least feels himself entitled to offer an opinion. This accounts for the anomaly of professional gentlemen submitting designs for proposed works to public committees—composed of members unacquainted either with drawings or the judicious application of scientific or artistic principles—finding themselves obliged to bow to decisions, and tacitly become the media for perpetrating what their experience has taught them to be both unsuitable and non-orthodox, and of which, sooner or later, when the public raises an outcry, all the odium is unjustly heaped on their own heads. When any improvement, municipal or otherwise, is mooted, a perfect mania for suggestions commences, and the newspapers teem with letters from "A Citizen," "A Constant Reader," "Your Subscriber," &c., &c.—all, no doubt, dictated with the best of feeling, but tending rather to complicate than satisfactorily attain the end proposed. These remarks are particularly applicable to the contemplated widening of Carlisle Bridge; and we have, since our last publication, been literally inundated with a host of communications, almost sufficient to sweep away the beautiful structure altogether.

This bridge will not bear to be tampered with, unless by a very skilful hand. The same mind that conceived its design also served to beautify our streets with their world-famed public buildings, and, as a work of *art*, is, for its extent, unsurpassed in the three kingdoms. Suggestions are occasionally valuable in their way; but if every journalist attached importance individually to each, he should find himself pretty much in the same position as a certain fabulous biped and quadruped, whose *finale* is stated to be very ludicrous, and presents a good moral both to youth and adults. Amongst the many communications that have reached us, relative to the improvement of this bridge, we give place to a few particulars culled from one by Mr. J. S. Sloane, which merit consideration, from the fact of the proposal combining both economy, sufficiency of roadway, and non-interference with the architectural features of the structure; and we are reminded that Mr. Sloane exhibited, in our Great Industrial Exhibition of 1853, elaborately-finished drawings of his design.

Mr. Sloane proposes "to remove the cut stone composing the facial ornaments at either side, adding laterally to the arch sheeting, and re-erecting the facial kerb-stone in line with either side of Sackville-street, a strong boarding being substituted for the present ballusters while the works are in progress."

DUNDALK EXCHANGE AND MARKETS COMPETITION.

MANY of our readers will doubtless recollect that the Dundalk Exchange Committee, after a lengthened investigation, awarded the first premium for best plans sent in competition, to Mr. Murray, of Dundalk, and the second to Mr. John Neville; but it was subsequently found that the approved design could not be executed for the stipulated sum of £4,000, and it consequently was rejected. Another competition, limited to the authors of the premiated designs Mr. Thomas Turner, of Belfast, and Messrs. Bellamy and Hardy, of Louth (Lincoln)—took place, in which the latter gentlemen, by a small majority of votes, were declared successful; but no contractor could be found to give the required security—*ergo* these plans also were shelved.

Finally, at a recent public meeting, Mr. Murray was appointed architect to the proposed building, and directed to submit other drawings, but rumour says their execution will exceed £4,000. So runs the course of competition!

NEW WESLEYAN CHAPEL, SCHOOL AND MANSE AT PORTADOWN.

PREVIOUS to the erection of these buildings, which are far advanced towards completion, it had been determined on to extend the premises occupied by the Society, but that being found undesirable, the project was abandoned, and an entirely new structure decided upon. The block comprehends a chapel 60 by 40 feet, with galleries, vestries and vestibule; a spacious school-house adjoining, and containing on the first floor, a large room, 60 by 30 feet, with moveable partition in the centre, so as to form two apartments, one for boys, and another for girls, 30 feet square, and 18 feet high, and four class-rooms, on the ground floor; also a manse, close by, containing dining, drawing-room, library, and five bed-rooms, with out-offices, &c. Exteriorly the design is of plain, but appropriate character, with the exception of the chapel, which has a tetrastyle Corinthian portico with mutuled cornice and pediment, and facing Thomas-street. The flank of the chapel, and front of the school building, are towards New-street. Mr. Boyd of Belfast is the architect, and Messrs. Brown and Ross the builders. The estimated cost of erection is £4,000. Material, whinstone with a quantity of cut-stone dressings.

CONVERSAZIONE AT THE ROYAL DUBLIN SOCIETY.

On the 8th ult. one of those delightful *reunions*, at which all may indulge freely in "the feast of reason and the flow of soul," took place at the Society's house, Kildare-street. Dr. Haughton read a very interesting paper on "The remains of a Roman Bath at Chester," descriptive of the history and characteristics of this and similarly-constituted structures; and in the course of his learned disquisition took occasion to allude in complimentary terms to "The Dublin Builder," as having commenced the important subject of baths on the Oriental system, hoping that it would be enlarged upon. Mr. Reid read a very elaborate paper on "The Theory of the Gyroscope," which, although evidencing a perfect acquaintanceship with the properties of this remarkable invention, nevertheless involved too much abstruseness and variety of algebraic calculations—not put forward impressively or clearly—to command even ordinary interest with the audience. Professor Barker read for Dr. Muspratt a paper on the "St. Ann's Well, Malvern," and for Mr. W. Tate on "The Holy Well, Malvern," and very wisely spared his hearers' patience in listening to a voluminous chemical analysis. Lord Talbot De Malahide, who occupied the chair, retired rather early; and after the papers were read, and some presentations exhibited, the meeting adjourned for refreshments. Another evening meeting took place on the 28th ult., at which Mr. Thomas A. Dillon explained his "improved plan for saving the crews of ships in distress," and Mr. Scriber read a paper on "the Construction of Turret Clocks;" Mr. Murray exhibited "an improved silk throwing machine," and Mr. E. J. Harty some beautifully-executed chromo lithographs.

INSTITUTE OF CIVIL ENGINEERS OF IRELAND.

A monthly meeting of this body took place on Tuesday evening, the 18th ult.; Mr. M. B. Mullins, President, occupied the chair. A paper on "The causes of Failure of Bridges over Mountain Rivers," by Mr. John W. Kelly, was, in his absence, read by the Secretary, which, referring first in general terms "to the frequency of such failures, particularized the damages done by the floods last September, in the Counties of Kerry, Mayo, &c., &c. The author held that such casualties might be prevented by more careful regulation of the water-way, both of the bridge and the channels above and below it, than is usually observed." In the case of the bridge over the Feale at Abbeyfeale, on the borders of County Kerry, a structure often noted by us as spacious and substantial, nevertheless the current of the continuous heavy rains annihilated it, and caused the loss of some lives also, owing, no doubt, to some miscalculation as to the *maximum* force of the stream, which at all times flows rapidly through it.

TOPOGRAPHICAL SKETCHES.

SKERRIES, AND ST. PATRICK'S ISLAND.

We certainly select a rather uninviting and unfrequented locality to form the subject of our present sketch. There are few places in the County Dublin with which the denizen of the metropolis is less familiar than the wild and picturesque beach of Red Island and Skerries. And it is not surprising that such should be the case, since the opportunities afforded for visiting this *locale* are but few, although one of the stations on the Dublin and Drogheda line of railway.

The first novelty which strikes the visitor as he enters the village (situated about one mile from the station, and eighteen from Dublin) is the neatness, order, and cleanliness which pervades, to a very great extent, this little town. No noisome heaps of dirt on the highway, with pigs wallowing therein in swinish bliss, are here to be met with, or ragged, barefooted urchins, devoting their bodily and mental energies to the manufacture of marbles (?) of mud, and uninviting confectionery in the shape of clay-pies. An excellent tambour factory for muslin embroidery, and two good national schools, established many years ago, snatch the children from idleness, and teach the young idea how to achieve better things than a dirt-pie or pagoda of mire.

No visitor can fail to observe the regularity with which the little white-washed cottages of Skerries are built, and the smooth, wide and unsullied surface which its main thoroughfare presents on a fine autumnal day. And, then, only look at the width of the footpaths on either side, resembling nought metropolitan that we can compare them to, unless indeed it might be those of the "Boulevards des Italiens" at Paris. In this particular, but certainly no further (except, perhaps, the civility of its people), does Skerries resemble the gay capital.

We cannot well understand how the main street is not grass-grown more or less. Look down the long thoroughfare, and you scarcely see man, woman, child, or animal, to dot its even surface, a circumstance which does not arise from dearth of inhabitants, for it contains (according to the last census) a population amounting to something like 2,300 people, of which 400 are sailors. This return, we regret to say, is not as respectable as it should be; for, in 1831, the official report announced the Skerries population as 2,556. The town appears to have been known anciently by the Saxon name of Holmpatrick, the first syllable of which, Holme, signifies haven or harbour; and Skerries, in the olden time, was quite a Portsmouth in importance. The addition of "Patrick" to the Holme, may be attributed to the frequent visits paid by the Apostle of Ireland to the village, and for its proximity to St. Patrick's Island, of which we shall speak hereafter.

The only historical circumstance which can be said to be connected with the place is, the landing of Sir Henry Sidney here in 1575, immediately after his appointment by Queen Elizabeth to the Lord Deputyship of Ireland. The harbour, which is tolerably large, is well situated, and affords good shelter in S.W. gales. Prior to the withdrawal of the fishery bounties, the trade of Skerries was very considerable. In 1846, there were two vessels of 60 tons in the port, and forty from 30 to 150 tons, well manned with yawls, and an extensive supply of those invaluable appendages nautically known as "Hands." Upon reference to the Irish newspaper files for 1755, it will be perceived that a grant of £2,000 was awarded by the Irish Parliament for the construction of its pier, which became, however, so much dilapidated by storm in subsequent years, that it remained quite neglected, and would most probably have fallen into utter decay, if the proprietor of the town had not handsomely come forward and repaired it at his own expense.

What is that square embattled tower crowned with pinnacles which appears so haughtily to look down upon its less "stuck-up" neighbours? That, reader, is the parish church, and the capacious pile of building yonder, is the Catholic chapel. Appertaining to these places of worship are opposition national schools, wherein the little villagers receive much educational advantages. In the "good (?) old times," the entire parish of Skerries was always exempt from the intolerable tithe exaction, and of course those notorious and unfortunate riots which were the almost invariable attendant upon the despotic impost. Strewing the graveyard of the church, the antiquarian may find several large tombstones to interest him, three or four of which bear different dates in the fifteenth and sixteenth centuries. Within is a monument erected to the memory of the late landlord of the village, Mr. Hans Hamilton.

Leaving the village behind us, we direct our steps to Red Island, many years ago detached from the mainland, but now united to it in such a manner as to resemble a little promontory rather than an island. It now contains several dwelling-houses, and may be said to form a portion of the village. From the extremity of Red Island (on which there is a martello tower) to the mainland, the harbour is formed, and usually contains some twenty or thirty sailing vessels. In former times, when adverse winds prevented Irish vessels making into Kingstown Harbour, they were often obliged to put into Skerries, and there disembark their passengers, which we need not tell the reader was a very acceptable windfall to the struggling innkeepers of the town. This practice, however, has long been discontinued, and a Kingstown boat putting into Skerries Harbour is a thing unheard of in these enlightened days of telegrams and steam locomotion.

Away to the left, rising dimly in the distance, you may descry the picturesque ruins of an old castle, formerly inhabited by the Knights Templars; and, immediately over the town, two other objects, of less importance in a picturesque point of view, stand out in bare relief against the horizon. These are a brace of old windmills which we did not notice before, and which are merely adverted to now because the history of the conflagration of the principal one, some fifteen years ago, forms quite an epoch in the uneventful annals of Skerries.

With expressive action and glowing cheek, some honest old Fingallian will tell you all about its "total conflag-u-ration" years ago, and what a state of consternation Skerries was in that night.

"Yez may talk of fireworks," he will say; "but by the tables o' war, the Portobello man himself never saw the likes that could compare to the big win'-mill the night it was conshumed. You must know, Sir, the four blades o' the mill were covered entirely wid canvas, all coated over wid pitch, an' as there never was sich a win' blowin' as there happened to be on that night, the flames cotch them in double-quick time, and away it spun round and round, for all the world like a tremendious Catherine's wheel afther bein' fired off."

The Skerries and Balbriggan district is still known by the old Irish territorial designation of Fingal, and its inhabitants rejoice in the distinctive appellation of "Fingallians." This ancient name, according to the Annals of the Four Masters, was applied to a large territory, part of ancient Bregia, extending along the sea-coast between Dublin and Drogheda, and a few miles into the interior, which derived its name from a colony of Norwegians, which settled there in the tenth century. This race of people were called by the Irish *Fionn Ghaile*, which, being anglicised, signifies fair-haired foreigners; while those of the Danish colony, stated to have been established south of the Liffey, near Dublin, were known by the designation of *Dubh Ghaile*, or dark-haired strangers. The territory of Fingal, together with the City of Dublin, was possessed by the Danish and Norwegian colonies for nearly three centuries.

The Fingallians have been always remarkable for much muscular strength, agility and resolution, and it is their constant boast that these characteristic qualities have been creditably sustained by them with all their pristine vigour to the present day.

In a quaint old work entitled "Topographaia Hibernica," published in the last century, we find the race at present under consideration thus spoken of: "This district, situated to the north of Dublin, is inhabited by a people usually called Fingallians; they have a peculiar kind of dialect, in a broken English; short, guttural, and disagreeable to a nice ear." It may be well to say that "this peculiar style of dialect" has almost entirely passed away, and there is nothing about the appearance or voice of a Fingallian at the present day which would render him peculiarly remarkable.

The Skerries guide usually exerts himself considerably in calling the stranger's attention to the print of St. Patrick's foot, which he tells us is indelibly ingrafted in a small rock at the extremity of Red Island, not far from the water's edge. The print (which appears like the impression of a large foot in a mass of petrified mud) is firmly believed to be a genuine relic, by many of the natives. and not a few of them support that the impression of the second foot may be seen on a similar rock at St. Patrick's Island, about three miles away. The Apostle, according to tradition, when expelled by the Pagan inhabitants of the southern side of the Bay, landed on the Island, since called St. Patrick's, and consecrated it. A more interesting little spot, to our thinking, with the exception perhaps of Innisfallen, "where erring man might hope to rest," does not exist in or about Ireland. Regarding it in this light, it is not surprising that we should have felt a desire to set our feet upon its shore, and explore all that remains of that remarkable monastery which hallows the little Island of St. Patrick. With this object in view, we get on board an airy little yacht, the property of our friend already alluded to, away we scudded through the angry sea, making direct for Innispatrick, our swelling canvas well-high kissing the water, at intervals, and ourselves and crew, at every lurch, pitched about from one side of the deck to the other in a manner the most unprovoked and unceremonious. As the gale increased, we thought, with a smile, of the anecdote which described four strong sailors as having been necessary to hold on the captain's hat.

The nearest island to the village is Shenex, on which there has been erected a formidable-looking martello tower, crowned with some pieces of ordnance. This island may be reached at low water from the mainland by all those who do not mind immersion half-way to their knees, and subsequent rheumatic pains. Next to Shenex, is Colt Island, so called, we take it, from a time-honoured tradition which declares that superannuated horses thrive from the moment they eat a blade of grass off the verdant sward which covers it. The Fingallians go so far as to say, that if a garran as attenuated as that which bore La Mancha's Knight is brought over to Colt Island and left there to graze, a striking improvement in the animal's condition is immediately apparent, and ere three weeks elapse (so the tradition goes) the quondam Rozinante may be removed from the magic spot as fresh and vigorous as a young colt. The number of horses which may be seen grazing there decidedly attests that this absurd assertion is firmly believed by many of the inhabitants; but the condition which the animals present is very far indeed from corroborating the truth of it. After the incomparable Colt Isle, comes St. Patrick's; and a few miles further away in the ocean may be seen the Rock of Bill. This small cluster of islands must not be confounded with a little group in the Atlantic called the Skerries, situated on the north-west coast of Antrim, and not far from the Giant's Causeway.

Some knowledge of scaling is essential to reach the top superficies of the island, as its banks. all round, rise somewhat perpendicularly from the water's edge, and the few pathways which have been formed from time to time about it do not much facilitate the ascent. We smiled as we wound our way up, when we bethought us how, more than fourteen hundred years ago, St. Patrick did the same; and, with some fertility of imagination, we pictured the great Apostle to ourselves, sticking his crozier in the ground at every progressive step, in order to assist him in the steep ascent. These banks, as also other portions of the island, are nearly as much burrowed with rabbit-holes as a piece of old wood extensively eaten by the dry-rot; and epicures have frequently confessed over their cups, that there is a peculiar flavour about the little animals which is most delicious and rare—a quality attributed to their living almost exclusively on the "wild thyme" and "nodding violet" which luxuriantly cover the banks of this consecrated spot. If Old Ireland was the Island of Saints *par excellence*, we suppose Innispatrick ought to be the Island of Saints Junior, for it is asserted that the bodies of many of the canonised Irish are interred in and around the ruined monastery. Whether this may be the case or not, we cannot pretend to say, but certain it is that human skeletons have been discovered on more than one occasion in its hallowed precincts.

The island contains about nine acres of ground, which in springtime is covered by an exquisite carpet of wild flowers, whereon the rabbits disport and gambol in the most amusing manner.

The monastery must have been somewhat extensive in its palmy days. as fragments of it may still be seen standing in two or three parts of the island, a great distance removed from each other, but all evidently forming one edifice many centuries ago. The principal fragment stands immediately over the sea, and has a very fine effect when viewed by twilight from the water beneath. According to the Annals of Ulster, a monastery was founded here at a very remote period, which the Danes are recorded to have burnt in the year 797. About 1120 it was re-founded, and dedicated to the Apostle of Ireland. In 1148, as stated in the Annals of the Four Masters, a synod was held here by Gelasius, Archbishop of Armagh, in which fifteen bishops, two hundred priests and several others of the clergy participated. Altogether it is an interesting ruin to the student of Irish history, and well deserves a visit. In the work already referred to ("Four Masters," page 270) we find mention made of this Island, which it may not be irrelevant to quote:—"The place of St. Patrick's landing is supposed to have been on some part of the County Wicklow or Dublin; but being repulsed by the natives he sailed northward, and landed on a small Island on the coast of Bregia, which was subsequently called St. Patrick's, and is situated near Skerries, in the County Dublin."

Inside the ruin a grass-grown earthen hillock marks the spot where a detachment of money-seekers made their excavations some thirty years ago, before the Californian gold-diggings were ever even thought about. The digging, it appears, was prosecuted with considerable industry until they came to a stone arch leading into some vaulted passage, then, as now, completely filled up with clay and rubbish. Whether strength, patience, permission or finances were required to pursue their investigation, or whether it was that a Babel-like confusion unexpectedly ensued, history does not record. Certain it is, they went no further—perhaps from a feeling of superstitious awe. The hole was refilled instantly, and away the diggers went without discovering any money to reward them for their pains. We must not omit mentioning, however, that a few church ornaments were turned up in the excavations, together with a rude square of greenish-coloured glass. St. Patrick's Island was lately advertised to be let; and it more than once occurred to us that if some of our zealous archæologists would take it, and cause the work to be resumed which the money-seekers abandoned so capriciously thirty years ago, they might, in their investigations, find some interesting antiquities to grace the Museum of the Royal Irish Academy.—*The Institute.*

Architecture and the Royal Dublin Society.—On the occasion of the recent distribution of prizes to the pupils in the Society's schools, His Excellency the Lord Lieutenant offered the following pertinent remarks relative to the neglect of architectural education at present apparent there:—"The various subjects in which it appears from the report the pupils have been instructed, must have struck you all as being of a most useful character; but there is one art in which I feel deeply interested—though no proficient—for progress in which I have not observed any prizes awarded to-day—I mean architecture! I think I understand that in the higher walks architecture is included. I hope that it will here attain to considerable importance, and that if, perhaps, as Dr. Waller has said, we all meet again here next year, as I hope we will, I may hear of prizes being awarded to some students for proficiency in that most useful and beautiful art."

The Catholic University Church in Stephen's-green.—This building, recently erected after a model of a church in the Catacombs, has been denounced by the Rev. Mr. Thomas (a votary of Pugin's) of St. George's, Southwark, as "a horrid monster of a building,' and "a horrid thing that frightens the world." Some one replied in a pamphlet entitled, "A Word to the Goths," ridiculing Gothic architecture. Dr. Newman. the Rector of the University, in disclaiming the authorship of the pamphlet, says, "he never set himself against the adoption of Gothic architecture in ecclesiastical structures; and "though at first contemplating its adoption for this church. and thinking it the most beautiful of architectural styles, nevertheless claimed the liberty of preferring for the purpose of worship and devotion a description of building which, though not so beautiful in outline. is more in accordance with the ritual of the present day. more cheerful in its interior, admitting more naturally of rich materials, of large pictures or mosaics, and of mural decorations."

Embellishment of Dublin.—A correspondent of *Saunders's Newsletter* again suggests the oft-repeated wish, "that Sackville-street should be ornamented with trees, like the European and American cities." This would be a consummation, no doubt, but there appear to be much more material improvements which first deserve public attention—very long talked of—but apparently as far off as ever.

Notes of New Works.

The first stone of the new National Gallery of Ireland, with which is incorporated the Dargan Testimonial, was laid on the 29th ult. by His Excellency the Lord Lieutenant. It will form a corresponding wing to the new Museum, built by the Royal Dublin Society, on their lawn at Merrion-square.

A new spire has been erected to the Roman Catholic cathedral at Ballina, of limestone, with twelve spire lights, terminated by a bronzed cross. Total height, 175 feet. Mr. Canning, builder. The cathedral is a Gothic structure, cruciform on plan, has transepts and a nave, and one aisle, also a recently added ribbed ceiling (after a design by Sir John Benson), with ornamental bosses, brackets, &c. The cost was about £35,000.

A new Roman Catholic church is proposed at Crossmolyon, according to plans furnished by Mr. Canning. It is designed to be cruciform on plan, with nave and transepts, tower and spire at west gable, chancel, sacristy, &c.; open timber roof, stained and varnished; and measures 100 feet by 30 feet. Material for walling is rubble limestone, with chiselled dressings. There is but one traceried window. The cost, including erection of spire, will be upwards of £2,000.

A new church is about being erected at Screen, 14 miles from Ballina, similar to the above.

A new convent is being built at Ballina, according to plans by Mr. J. J. M'Carthy, R.H.A., architect.

A neat school-house has been just finished in the town of Ballina, for the Methodist Society, by Mr. Canning, builder.

OYLEGATE CHURCH.—We have received from a correspondent a description of the rise and progress of this building. The walls are now over twenty feet high, and just ready to arch in the side windows, four on either side, which stand 12 feet by 3½ wide, divided by a mullion and tracery, and are neatly jammed, cased, and labeled with chiseled granite, as are also the doorways, the great eastern window in the chancel, and the new one over the grand doorway in front, on each side of which are inserted niches with foot base, labels and ornamental facings of the same well-executed material for statues of the Immaculate Virgin Mary and St. Joseph. The grand five-lighted window, with its catharine wheel and trefoilated tracery, stands 21 feet by 10 wide, and the fine three-lighted one, 12 by 5½ feet wide. The material is of the best quality of bluish quarry stone, unexpectedly found in the old quarries of Jamestown, and gratuitously presented to the parish by the liberality of the proprietor, Nicholas Gray, Esq., Tenny Park, County Kilkenny, who gave the desired site and title. Mr. Patrick Murphy, of Enniscorthy, is to finish the church suitable to the style of the early English, for the sum of £1,259. Sir James Power, Bart., contributed £100; Lady Power, £20; and each of their children, £25; as also did the Rev. Mr. Busher, £40; Mr. Michael Murphy, £50; and Messrs. Michael Sutton and Ryan, £30, &c., &c.

An addition of 40 feet is being made to the Robertstown viaduct, which will make its entire length 360 feet. Mr. Dargan, contractor.

The new warehouse of Messrs. P. Johnstone and Son, now nearly completed in Donegal-street, Belfast, is an amalgamation of the Roman Doric—which prevails in the lower portion—and Corinthian in the upper storeys. The material used in the former is Scottish freestone; the upper part being Portland cement. The building is 100 feet deep, 60 feet high, and has 50 feet frontage. The windows have their frames and sashes, which are of solid mahogany, filled with polished plate glass, supplied by Mr. Sibthorpe, of Dublin. The painting has been done by Mr. Gaskin, of Donegal-street, the stone work by Mr. Robinson, of York-street, the carpentery by Mr. Carlisle, of Donegal-street. The gas-fitting, which is not yet complete, has been entrusted to Mr. R. Stewart, of Victoria-street. This warehouse, which is for the wholesale grocery trade, is of a very important character, and adds another to the list of handsome commercial establishments with what Belfast is adorned.

A new Roman Catholic church is building at Bohola. Messrs. Doolin, builders.

A new school is being built at Coleraine, and when completed will cost about £4,000.

A new Temperance Hall, which will include coffee-rooms and a saving's bank, has been opened in Derry.

PROPOSED NEW INDIA OFFICES IN LONDON.—Messrs. G. G. Scott and Digby Wyatt have been appointed by the Secretary of State for India in Council, joint Architects for erecting the new India Office. It will form a united front with the proposed Foreign Office, and will occupy half the site in Downing-street, which faces Parliament-street. Mr. Scott to design the exterior, and Mr. Wyatt the interior.

A marble statue of General Sir Charles Napier is proposed to be placed in St. Paul's Cathedral.

The Limerick and Ennis railway has been opened for public traffic as far as Clarebridge. The bridge over the Fergus, at Ennis, will be one of the finest structures in the kingdom.

THE DUNDALK AND ENNISKILLEN RAILWAY.—According to a notice understood to have been served on the Government Inspector, the line will be ready for opening to Enniskillen on the 1st of Feb.

A statue of Louis XIV. is about to be placed in the wood of Vincennes, recently converted by the Emperor Napoleon into a park in English style.

VENTILATION FOR CHURCHES, THEATRES, ASSEMBLY ROOMS, &c. —We would suggest as an efficient mode of ventilation: a gas-light, or a number of jets, according to the capacity of the building, to be kept burning at the highest point of the ceiling, immediately under and enclosed by a funnel-shaped flue of cast iron, communicating with a pipe of the same material, which should be carried above the highest point of the roof. This will act in the same manner in drawing a current of air as the ordinary fire-place, causing all the vitiated air of the apartment to ascend to it, and be carried off in its flue. If required to be used during daylight, it can easily be concealed by an ornamental thoroughly-obscured glass globe, or metal centre-piece open only at the sides.

THE STREETS OF CORK.—The local journals, like those of "dear, dirty Dublin," teem with complaints respecting the muddy state of the streets, and one correspondent concludes by saying, that "the mud looks so venerable that it might plead prescription against any one who attempted to disturb it." The Corkonians, however, have not yet seen the farce enacted, as in Dublin, of their Corporation waiting on the magistrates to ask their assistance in making householders sweep before their doors, laying blame on the latter chiefly, and shoving culpability off their own shoulders. Rather a cheap mode of scavenging that for the municipal council to adopt! It should certainly cause a reduction in taxation.

To Correspondents.

C. C. H., Artizan (Your views are erroneous; we disclaim partiality to *any* class, and a re-perusal *ought* to convince you that its tone was quite as favourable to one as the other).—M. M. (We shall take an early opportunity of replying, perhaps personally).—R. R. B., Cork (We note suggestions thankfully, and deem yours valuable).—Workman, Limerick (Copies are obtainable from Mrs Flinn, bookseller, in your city).—R. P., Wexford (The subscription, per post, is 4s. annually in advance).—Intending Subscriber, Cork (You will see our agent's name and address at foot).—C. E., Mudlark (A hackneyed subject). —Viator, X. Y. Z., &c., relative to Carlisle Bridge, noticed elsewhere.

To Advertisers.

Special attention is respectfully directed to the advantages offered by "THE DUBLIN BUILDER" *as a medium for advertisements of a* certain *class. It is* simultaneously *circulated in* BELFAST, CORK, *and* GALWAY, *as well as* DUBLIN, *on the 1st of each month, and its list of patrons comprehends nearly all the principal* ARCHITECTS, CIVIL ENGINEERS, COUNTY SURVEYORS *and* BUILDERS *in Ireland; independent of a host of other parties, whose occupations or tastes are more or less identified with the purposes for which the Journal is being established.*

The heads of some eminent manufacturing firms, both in England and Scotland, have already recognised and adopted it, as a desirable medium, and doubtless their example will be followed by others. Without presuming to state that the extent *of its circulation can compare with some* old *established journals, we must, nevertheless, impress on you, that being a class periodical, it* at once *goes* directly *into the hands of those, for whom certain advertisements are intended, and remains with them as a permanent record; unlike the evanescent character of some other journals, having a more promiscuous circulation.*

"THE DUBLIN BUILDER" *is also to be found at Public Reading-rooms, Libraries, Mechanics' Institutes, Clubs, Hotels. &c., &c. Approved blocks or stereotypes will be inserted in the advertisement pages.*

NOTICE.

Orders for Subscriptions to, and Advertisements for, THE DUBLIN BUILDER, *will be received at the Proprietors' Office,* 17, LOWER GARDINER-ST.; *or by the Wholesale Agents*—GEORGE MASON, 24, *D'Olier-street; and* JOHN PLASTO, 144, *Upper Abbey-street;*

At CORK, *by the Agent, Mr. S. M. Peck,* 40, *South Mall;*

At BELFAST, *by the Agent, Mr. Francis Dowd,* 47, *Townsend-st.; and all Booksellers;*

At GALWAY, *by Mr. T. J. Connolly, and Mr. Wade, Booksellers.*

Agent for LONDON, *Mr. Francis Fisk,* 5, *Lordship-lane, Tottenham N.*

Yearly Subscription (payable in advance), 3s.; *per post,* 4s.

NOTICE.

Owing to a quantity of Advertisements crowding in on the eve of our going to press, and when we had not an opportunity of either increasing the size or publishing a supplement, we find ourselves reluctantly compelled to intrude upon the ordinary reading space. Should we be enabled, however, to retain a similar complement of Advertisements for next or succeeding publications, we shall enlarge the journal without extra charge, and trust that for this number our friends will overlook the encroachment.

THE LAND AGENT AND SURVEYOR'S POCKET BOOK, free by post on receipt of forty-eight 1d. stamps, by the Author, D.E. HEFFERNAN, Civil Engineer, Surveyor and Valuator, of over 20 years' varied and extensive practice, 41, Upper Sackville-street.

Machinery, Patents, &c.

PATENT METALLIC BEDSTEADS,
WITH PATENT FAUCET JOINTS.

Attention is respectfully directed to the superiority of these over other descriptions of Metallic Bedsteads.

Whilst excelling all other kinds in the great simplicity of construction, & facility of putting together, they present to the eye a substantial and elegant outline, instead of that meagre and unsightly appearance which has hitherto been so great an objection to other descriptions of Metallic Bedsteads.

The joint, which is extremely simple, has no projecting part, is very accurately fitted, and has no liability to break or get out of order; and the Bedstead when put together is remarkably firm.

Manufactured solely by the IRISH ENGINEERING COMPANY, who invite inspection of their very large and varied Stock, at the SEVILLE IRON WORKS, SEVILLE-PLACE.

VENTILATION—PURE AIR.—A New Patented VENTILATOR applicable to Public Buildings, Houses, Ships, Carriages, &c.

"It is exceedingly ingenious, and the inventor has solved the problem which has so long baffled the calculations of science and experience."—*Atlas.*

"A cheap, simple, and unerring means of obtaining *perfect* ventilation."—*Times.*

For particulars apply by letter to J. P. BYRNE, Esq., Solicitor, North-West Chambers, 4, Lower Ormond-quay.

NEW INVENTIONS AND DESIGNS
PROTECTED *(pursuant to the Acts of Parliament) for the exclusive use and benefit of the Inventors or Designers. The principles and details of manufacturing all existing Patented Articles, and of making Registered Designs, fully explained. Application by letter to* JAMES P. BYRNE, *Esq., Author of "The Law of Patents and Designs," &c., 4, Lower Ormond-quay, Dublin.*

HIBERNIAN Gas Light Company.

Committee:

LEONARD THORNHILL, Esq., Chairman.

John Patten, Esq. | Robert Simpson, Esq.
James Haughton, Esq. | Jeremiah Dunne, Esq.

2, Foster-place, Dublin, 1st Jan., 1859.

The Price of Gas is THIS DAY REDUCED to FOUR SHILLINGS and NINEPENCE per Thousand Feet, in accordance with the Notice in previous advertisements.—By Order,

GILBERT SANDERS, *Secretary.*

REDUCTION in the PRICE of GAS.—Notice is hereby Given that the Directors of the Alliance and Dublin Consumers' Gas Company have this day REDUCED the Price of Gas to FOUR SHILLINGS and NINEPENCE per Thousand Cubic Feet.

By Order,
JOHN STEVENSON, *Secretary.*
114, Grafton-st., 1st Jan., 1859.

GAS FITTINGS. — The Alliance and Consumers' Gas Company, expecting that the reduced price of Gas, added to its many other advantages, will produce a largely-increased consumption, and consequently involve the necessity of putting up additional Fittings, have made arrangements for meeting the requirement of the Public in both respects.

Their SHOW-ROOMS are amply stocked with the Newest Designs in CHANDELIERS, BRACKETS, HALL and LOBBY LIGHTS, &c.; and they specially invite an inspection of their GLASS LUSTRES, to the selection of which they have given particular attention.

114, GRAFTON-STREET.

It is the desire of the

WESTERN LIFE ASSURANCE SOCIETY OF LONDON (Established in 1842). to Lend Sums of from £50 to £500 on Personal Security, collateral with Assurance.

Iron Founders, Plumbers, &c.

THOMAS HENSHAW AND CO., (Successors to Luke Butler, 5, Christchurch-place and 16, Kennedy's-lane), Wholesale Furnishing and Builders' Ironmongers; also Manufacturing General Ironmongery and Tool Warehouse, 81, Middle Abbey-street — Spade, Shovel, and Tool Works, Clonskeagh—beg to call attention to their extensive Stock of Hardware in all its different branches, which they are prepared to supply on the most moderate terms. Iron Wire for Fencing, and Galvanized Wire Netting, at reduced prices. Agents for the Sale of Thomas Perry and Sons' Patent Fire-resisting Wrought-iron Safes, with drill-proof Doors and powder proof Locks. They are the best safeguards in the world against fire and thieves. On the 30th July, 1857, the above were publicly tested at Belfast, in the presence of many influential gentlemen, and their superiority in resisting prolonged intensity of heat, and in baffling all attempts to effect access by drilling instruments, was placed beyond doubt. *Strength and quality considered, they are cheaper than any other made.*

⁂ Also on Sale, Saunders' Patent Cooking Range, which is the most economical and perfect Cooking Apparatus of the day.

IRON CASTINGS.

THE IRISH ENGINEERING CO. invite attention to the superiority of their Castings in Iron, to the very large number and variety of highly-finished models for every description of work which they possess, whilst the resources of their Foundry (the largest in Ireland) gives them facilities for executing orders with rapidity and economy, thus enabling them to offer advantages to Builders and others not to be obtained elsewhere.

---

500 ZINC NAME PLATES, for Carts, to choose from, and to be had on application from George L. Hill, Engraver, 9, Castle-street, Belfast.

The Dublin Builder.

VOL. I.—No. 3.

THE GAS MOVEMENT!

WHAT DOES GAS COST?

FIGURES, like facts—when based on reliable data—are stubborn things! but capable of being occasionally tortured to answer purposes. The public, therefore, should not confide too much in startling results, produced by a long array of calculations, but satisfy itself of their accuracy by examining items. Without introducing ourselves as practical or experienced gas engineers, capable of teaching the art of manufacturing gas of the best quality, and at the smallest possible cost, nevertheless we *do* claim to be sufficiently conversant with the subject *theoretically* to entitle us to a place amongst those who, for public information—and calling common sense tot heir aid—seek to adjudicate on the conflicting statements recently circulated in our city. Cheap light, as well as cheap food, cheap clothing, and cheap house rent, is a desideratum to which not only the poor man anxiously looks, but also does every member of the community who has a regard for his pocket; and is one of those articles in every-day use which must be affected by the march of improvement towards universal economy. Be assured a mercantile firm will not, from mere philanthropic motives, supply goods to the million at a loss, or that a *bona fide* gas company will light our dwellings without an actual profit on the aggregate supply. But as water finds its level, so does labour and every known article develop, sooner or later, its marketable value; any material deviation, therefore, from the usual tariff, unless where the deterioration of the raw material may justify it, at once excites curiosity, and probably suspicion that chimerical elements must exist in promised advantages. To determine, therefore, if it be practicable to supply the citizens with *better* gas, and at a greatly reduced rate, to that now in use, attended with profit to the manufacturer; and to treat generally of items affecting a principle in which the public must feel deeply interested, is our immediate purpose in devoting a series of articles to the subject; and we are also led to inquire how a company dawning into existence is enabled to supersede those for many years pursuing their operations, and by whom each fall in the market has been turned to greater or lesser account.

To this end let us examine propositions, without, however, wearying our readers with more statistics and figures than are necessary.

The prospectus of a new company, entitled "*The Independent Gas Consumers Company*," projected by Mr. Flintoff, a gentleman whose name has been identified for some years past with agitation respecting gas, both in Dublin and elsewhere, proposes—

> "To supply the city and neighbourhood of Dublin with gas at 3s. 6d. per 1,000 cubic feet, of *better* quality than that at present charged 5s. per 1,000 feet."

And, moreover, that this

> "Is to be a uniform charge to both large and small consumers, free from meter rent; and when the profits of the company exceed 10 per cent. per annum, a further reduction will be made."

In testimony of its capability to perform this, the company (or its projector) advances that—

> "The price of gas in London, Birmingham, Sheffield, and Liverpool varies from 2s. 10½d. to 4s. per 1,000 feet, and one of the Dublin gas companies is supplying the inhabitants of Cork with gas at *Two Shillings and Six pence* per 1,000 feet, while the charge in Dublin, through the absence of competition, is at present 5s., with meter rent, making it about 5s. 3d. per 1,000 feet."

And further that—

> "In consequence of reductions in cost of apparatus, and improved modes of manufacturing gas, a *new* company can erect the most efficient gas works for less than one-fourth of the sum said to be expended by the existing companies."

And that—

> "Her Majesty's Commissioners of Woods and Forests reported in 1847 that good gas can be afforded in Dublin at 3s. 6d. per thousand cubic feet, after paying dividends of ten per cent. per annum on a much larger amount of capital than is now required to erect gas works."

This, doubtless, sounds very well, and if carried out would decidedly prove a great desideratum, and fully account for another paragraph in the prospectus—viz., that,

> "The directors have the pleasure to state, that contracts representing an annual consumption of 212,000,000 of cubic feet of gas have been signed by 6,114 individuals and firms, who are ready to become consumers of gas as soon as the company can supply them. It is also worthy of remark, that before issuing a single advertisement, 437 influential resident consumers of gas have become the holders of a very large proportion of the company's shares."

We are told also that—

> "For the convenience of the public, it is proposed to lay the mains and service pipes of the company, during the night, upon the plan successfully adopted in London, where sixty miles of pipes were laid in the short space or two months."

Confining ourselves for the present to the question of *better* and *cheaper* gas, as promised for 3s. 6d. per 1,000 cubic feet, than that now supplied at 5s., lately reduced to 4s. 9d.; we must remark that the quality remains *yet* to be proved, for there is a vast difference in the illuminating power of the gas extracted from Whitehaven and Newcastle coal, as well as other coal; for instance, Blenkinsop, which is used by and delivered to the Belfast company at 13s. 6d. per ton. If, therefore, the quality be affected, the cheapness becomes a matter for consideration, for an old adage says, "the *best* is the cheapest;" but, for aught we know, the illuminating power of the proposed gas may be intended to be *superexcellent*; and we heartily wish, for the sake of the consumers and the citizens generally, it may prove so.

With respect to item No. 2, we unhesitatingly must subscribe to the universal opinion as to the obnoxiousness, and, we may add, as to the palpable injustice of "meter-rent" at all, for with quite as much reason might merchants and traders impose a tax on the public for the conveyances and materials requisite for the delivery of their goods to customers, as a gas company for the supply of gas by meter to their houses, at its own quoted prices; besides which, the apparatuses intended to determine the value of the quantity delivered to the consumer, are supplied by the companies themselves, and what guarantee is therefore afforded to the public of the accuracy of their just action towards manufacturers and consumers? That meters, like clocks, watches, and all mechanical indicators, will at least occasionally get out of order, is an admitted fact, but a question at once suggests itself, who is to *pay* for the irregularity in the former case? Various are the complaints that have reached our ears, and those, too, from intelligent parties, some of whom state openly that when their consumption is but *one-third* at one time what it is at another during a similar period, the demand made by the company, according to the index of the meter, actually exceeds in quantity and amount what it was previously.

Now we can also adduce a fact that where a small account for a quarter's gas supply was 3s. 6d., the meter-rent was 2s., or better than *one-half* the cost of the gas; thereby charging a total of *five shillings and sixpence* for about *seven hundred feet* of gas, whereas we are told that it is purchaseable at *four shillings and nine pence* per *thousand* cubic feet. We must urge the desirability of dispensing with meter-rent altogether, and *if* the intention to do so of the "Independent Gas Consumers Company" be faithfully carried out, it shall have earned worthily the gratitude of the public,

With reference to the comparative value of gas in London and the other towns named in the prospectus of this company, as compared with Dublin, we find a difficulty in tracing any analogy, except as regards London; and we shall presently show that instead of coal being cheaper in Dublin than London, it is precisely *vice versa*, *ergo*, the gas companies there can afford to sell cheaper than ours, allowing themselves a remunerative percentage on the capital stock.

Strange that, although the report of the Commissioners of Woods and Forests is quoted as an authority to justify an undertaking to supply gas in Dublin at 3s. 6d. per 1000 c. f., there is not a word from this potent agitator respecting the parliamentary return laid before the House of Commons on motion of Mr. Brotherton, showing the price of gas, per 1,000 cubic feet, charged by companies established by parliamentary authority in England, and which clearly shows that in Sunderland and other districts, where the best coal can be had at 5s. 6d. per ton—*instead of 18s. 9d., as in Dublin*—and is literally tumbled out of the pit into the retort-house, the minimum price of gas is 3s. 9d.; or that in Bath, Harrowgate, and Hartlepool, towns in the midst of coal districts, the charge ranges from 7s. 6d. to 4s. 6d.

Again, we are told that "the price of coal had really little or nothing to do with the price of gas;" if so, why not at once adopt a uniform rate in the United Kingdom, and cease further agitation? But this code of reasoning is not quite palatable to our taste, and rather opposed to common sense. Where the raw material is increased or decreased in value, and labour the same or nearly so, it appears to us a patent fact that the cost of manufacture and supply *must*, of necessity, be proportionate. Referring to the latest freights of Newcastle coal, we find them as follows—viz., London, 6s. 3d. to 6s. 6d. per ton; Dublin, 10s.; and Cork, 9s. 3d.—which at once falsifies the statement that coal is 20 per cent. cheaper in London than Dublin.

Our space reminds us that we must postpone the further consideration of items until next number.

JENNING'S PATENT DRAIN PIPES.—A model of this invention having been recently submitted to our notice, we examined minutely the principle on which its claims for superiority to the ordinary pipes hitherto in use are founded; and we feel much pleasure in reporting the result of our examination to be highly satisfactory. The great objection to tubular drain pipes for general purposes is the frequency of stoppages, occasioned by the accumulation of soil, which the force of the liquid was insufficient to carry away in its course, and the consequent temporary uselessness of the pipes in performing their duty, until considerable expense has been undergone in excavating and removing lengths of the drain, to ascertain the cause of the impediment. By a simple contrivance of placing each tube resting at both ends in rebated cradles, the upper joints being covered by saddles of similar construction, this obstacle is successfully overcome; for when a stoppage takes place, the immediate position of the defect is ascertained, and facility for its speedy cure presented, by the removal of the saddle, whereby the pipe may be cleansed; or if it be broken, a new length can be substituted, by lifting it out of the cradles, without interfering with the rest of the drain. The invention is at once simple, ingenious, efficacious, and economical; we hope to see it coming into general use.

THE SEVEN CHURCHES—GLENDALOUGH, WICKLOW.

THE lone and singularly wild valley of Glendalough, in the county of Wicklow, lying at a distance of about 24 miles from Dublin, presents a scene which, for stern and desolate grandeur, is in many respects unsurpassed. Huge, gloomy mountains upon which clouds almost continually rest, encompass, and in some places overhang, the silent and almost uninhabited glen. Two little lakes, now appearing in the deepest shadow, now reflecting the blue vault, according as the clouds above them come or go—a winding stream, and grey rocks jutting here and there from out the heath—form its natural features. A noble monastic establishment, round which a city subsequently rose, flourished and decayed, was founded here in the early part of the sixth century by St. Kevin. The ruins of many ecclesiastical structures yet remain, and "the long, continuous shadow of the lofty and slender Round Tower moves slowly, from morn till eve, over wasted churches, crumbling oratories, shattered crosses, scathed yew-trees, and tombs, now undistinguishable, of bishops, abbots, and anchorites." How few of the gay tourists by whom the glen is yearly visited, view these ruins with any other feeling than that of idle and ignorant curiosity! Their ears have been poisoned with the lying tales (inventions of the last half century) which the wretched men and women, miscalled guides of the place, have composed for the entertainment of the thoughtless. They wander unmoved among shrines which, nearly thirteen centuries ago, were raised in honour of their God, by men joyous and thankful in the feeling of certain immortality—men whose fathers in their youth had reverenced the Druid as a more than human counsellor.

A gentle morning in spring beheld the writer descending the sequestered road which leads to the valley of the Seven Churches. This exquisite scene of loneliness and gloom was cheered at the moment by a partial gleam of sunshine, which shone on the deserted churches, and flung the shadow of the round tower, a "gnomon raised by time to count his centuries," across the uneven plain on which it stands. I paused to look upon the lake which lay beyond the ruins; a cold and motionless expanse of water, prisoned in by mountains of rugged granite, with scanty traces of foliage to qualify the rudeness of the clifted heights. Yet there was more of a religious sadness than of sternness or terror in the character of the scene. It was a fitting solitude for the abode of those who fled to its quiet sanctuaries in ages long gone by, to repair the passionate excesses of early life, or to preserve their youthful innocence, and meditate in sorrow, rather than in anger, on the thoughtlessness of men.

Here it is, returning from the turmoil of London and agitating pursuits, that the wanderer feels all the folly and idleness of life which he has led; that his heart sickens at the recollection of the dissipation of cities; that he opens his soul to nature as to a long-forsaken mother, and thinks, with an aching bosom, of the purity, the simplicity, the religious regularity of his childhood. Here it is, that we seem once more, in the keenness of awakened memory, to lose those friends that have been snatched away from us by death or distance; that the still reproaches of that mysterious principle in our nature, which points to the eternal object of our existence, steal upward through the tumult of our passions and our interests, and speak to our hearts like the voice of a long-forgotten friend. The rocks and woods, the lakes and water-falls, the ruins and the sober day-light, and the whisper of the persuasive wind, in scenes like this, convince the heart more readily than volumes of ingenious controversy, read over with aching head and weary eyes in the midnight chamber.

Here we feel the truth that it is too bright even for the eagle-eye of reason to contemplate. Ambition seems a dream, philosophy a guess; our spirit seems to mount above its tenement, and to behold the passions, the faculties, the sciences, and the occupations of man, at that leisurely elevation, where alone it can become acquainted with their relative value. Here we discover all the superiority of virtue over knowledge, and remember, with all that zest which feeling gives, even to the oldest truths, those fundamental principles of virtue, which, in our days of feverish enquiry, we were accustomed to despise for their want of novelty.

As the thrilling music of the Christian churches first drew those tears from the eyes of St. Augustin, which he afterwards shed from a purer and loftier impulse; so here we are won back to the love of innocence by the poetry of nature. She reproaches us with having so long preferred, to her infinite varieties of form and colour, of sound and fragrance, the coarseness of scenic imitations, and all the low artificial mockeries of her excellence which the palaces of art present to us. She seems to open her arms, and invite us to "return!" to blush for the meanness of our taste; to forsake the theatre, the picture gallery, the library; to study character in her towns and villages, beauty in her plains and valleys, sublimity in her mountains, and wisdom in the economy of her mighty system.
—*Gerald Griffin.*

THE BRONZE HORSES OF LYSIPPUS.

IN the last number of "THE DUBLIN BUILDER" we adverted to the exhibition of the London Photographic Association, and in glancing over their illustrated catalogue were struck by many subjects of historic interest. No. 133, Cimetta, Venice, the Bronze Horses, Portico of St. Mark, recall to mind so many recollections of the past, that we cannot refrain from giving them a brief record in our present number. History tells us "these horses, four in number, were sculptured by Lysippus, of Sicyon, about 300 years before the Christian era, and originally embellished the Temple of Minerva, at Corinth," and they had nearly grown old in the atmosphere of their own unclouded clime, when the nationality of Greece was absorbed by the gigantic power of the then mistress of the world. Corinth was totally destroyed, 145 years B.C., under the Consul, L. Mummius, and these horses were seized among the spoils of the city, and borne in triumph to imperial Rome, where they long graced the façade of the Temple of Peace, that magnificent creation of Vespasian, described by Josephus, "of such unexampled splendour as to astonish every beholder," where spoliation had accumulated with questionable taste—the enduring monuments and priceless gems of all that was intellectual and refined in art, the sculpture and painting of Greece mingling in lavish profusion with the gold of the barbarian, and the costly adornments, the sacred vessels, and holy garniture, sacrilegiously stripped from the Temple of Jerusalem, to grace the festive rites and religious mysteries at the altar of the twin sister of Athenæa.

But Rome had already beheld her palmiest day; a new home for her people was arising in the East. Constantine had cast his eyes on the sunny waters of the Bosphorus, and where Byzantium stood he planted a new religion and a new and peerless city, while Rome unwillingly relinquished her priceless treasures to her infant rival; and here, far away from their pagan home, encircled by gorgeous temples of the cross and gilded domes dedicated to the saints, the marble-built palaces of a luxuriant aristocracy grew around and eclipsed, in a measure, these inimitable models of Grecian art.

Again a new scene opens! The Western Empire was fading in decay, while the Eastern was succumbing to pressure from without. A gorgeous and a queenly city had emerged from the blue waves of the Adriatic; this was Venice, daughter of the sea, "enthroned in her hundred isles." In the beginning of the 13th century, Alexius, Emperor of Constantinople, being deposed, the Venetians were invited to assist in restoring his lost dignity, and during the tumults which followed, they laid siege to Constantinople, which eventuated in the capitulation of that city; and again the bronze horses were borne back to Italy, this time to preside over the waters of the Adriatic.

Here they remained until the close of the 18th century. Venice had long lost her prestige. A new and unquiet spirit was abroad. France had built herself in blood a dynasty of her own choice. Napoleon the First, in all his dazzling panoply of power, and amid his dreams of universal rule, had still leisure for a taste for all that is majestic and beautiful in art. The sculpture, the paintings, and even the relics of the architecture of European capitals, enriched Paris, and these horses were lowered from the Portico of St. Mark, to grace, for a little day, in the sunshine of his prosperity, the arch of the Place de Carrousel.

At length the star of the great conqueror had climbed to its ascendant, and was already upon the wane and finally, before its setting on the rocky shore of St. Helena, by the Convention of Paris the despoiled cities of Europe were permitted to reclaim their own; the Louvre, and with it all Paris, yielded forth its treasures, and the bronze horses were restored to their present resting-place on the Portico of St. Mark at Venice, where they stand an undying record, of 2,000 years and upwards, of the strange mutabilities of all that is earthly.

ON THE CAUSE OF FAILURE OF BRIDGES ON MOUNTAIN RIVERS.*

IT is quite a common occurrence to hear of bridges on mountain rivers being swept away by floods, and thoroughfares rendered dangerous or impassable, in consequence—sometimes causing serious accidents, and at all times much public inconvenience. The great rains and floods that occurred in September last have been productive of wide-spread damage in these respects In the mountainous districts of Kerry, Mayo, &c., the casualties have been numerous and important; and apart from the many inconveniences arising from them, the large expenditure rendered necessary for repairing the damages, is of no slight consequence, amounting, as it must do, to large sums of money.

If there be any principle or contrivance, by means of which these casualties may be prevented, or their number diminished, its discussion before this Institution would be desirable, in order that, if deemed practicable, it may obtain a larger degree of notice and confidence than it otherwise could be expected to receive. Believing that there is such a principle, and that its application is practicable and simple, induces me to submit this brief paper on the subject to your consideration. The writer should, perhaps, feel a degree of apprehension that if the principle were such as he imagines it to be, its simplicity must long ere now have insured its more general application; but we are all aware of the curious fact, that many common occurrences of great interest pass before us, day after day, without investigation—our perfect familiarity with their effects, rendering us quite unconscious of our ignorance of the causes; in short, we do not think of raising questions, being satisfied we know all about them.

This is particularly the case with occurrences that are familiar to us from early youth upwards, and amongst them may, perhaps, be classed mountain floods and the casualties attending them.

If we hear of the destruction of bridges on mountain rivers it is merely the old story, and, of course, followed by the old reply—"Oh, the great floods swept them away." If required by any chance to assign reasons, we very off-handedly name the insufficiency of size of arch, badness of foundation, inferiority of masonry, or, possibly, the piers or abutments being badly placed with reference to the direction of the current. We rarely, perhaps, invesgate the exact manner in which the floods act in producing the catastrophe.

No doubt a bridge labouring under any one or more of the deficiencies mentioned, is very liable to give way under the force and action of a mountain flood; but it is submitted that a bridge may be all right in these particulars, and yet that there is another requirement, without which it is by no means secure.

What, then, is this additional requirement? It is that the channel or water-way, for some short distance above, through, and below the bridge. should be of equal discharging capacity, and more particularly that the channel below should, on no account, be of greater water-way or discharging capacity than the arch or arches of the bridge. It is the great head of water above, and sudden fall through or at the down-stream face of the bridge, that produces all the damage. Reduce the channel below to the discharging capacity of the bridge, and the character of the action of the descending waters is changed, the sudden falls disappear, and the object sought is attained If the bridge afford sufficient water-way there is no reason why the channel below it should be larger; whilst if it do not afford sufficient water-way, it becomes doubly necessary, if the bridge is to be preserved, that the channel below it should be reduced to an equal capacity. If the bridge be of greater water-way than the channel immediately above it, then the portion of the channel immediately below should be brought to an equality of discharging power with that above the bridge; either by increasing the capacity of the latter, or reducing that of the former, as local circumstances shall render most expedient, bearing in mind that the channel below is, on no occasion, to be of greater discharging capacity than the bridge, and that the object sought to be attained is to convey the floods, in a comparatively moderate incline and velocity, through, and for some distance below the bridge. This can be done, it is submitted, by regulating the discharging capacity of the channel as above suggested.

---

* Read by J. W. Kelly, Esq., C.E., Ennis, at a meeting of the Institute of Civil Engineers, on the 18th ult.

It is quite a common occurrence to find a deep hole scoured away just at the down-stream face of a bridge. This is caused by the great action of the water as it issues from the arch, which not unfrequently may be seen pouring forth as if issuing from a sluice. Of course the extension of the holes up under the arches is a mere matter of time, more or less remote, according to the tenacity of the foundation and the frequency and scouring power of the floods. In order to save the bridges in such cases, the practice is often resorted to of filling the holes with stones, &c.; but the destructive cause remaining, a few subsequent floods, if not the very first, scoop out the holes again, and the destructive action proceeds as before. But even where no such holes could be formed—the bridge being built on the solid rock—they have often yielded under the force of a large head of water, generally to the action of the flood upon the (too often inferior) masonry of the piers and abutments.

The remedy in all these cases, as above stated, is to contract the channel below the bridge, so as to overcome the falls, and instead of allowing the floods to roll down in destructive rapids through the bridge, to raise them into comparatively deep volumes of water, moving with an easy incline and velocity.

The manner in which the necessary contraction of the channel may be effected will vary with local circumstances. In general, rough, hammer-dressed side walls will be found best and most convenient. They should be brought to the required width apart at or a little below the bridge, and after running parallel for 10 or 15 yards down stream, to commence to open out *gradually* to the general width of the channel. Where stones cannot be conveniently procured, the simple contrivance of projecting jetties, formed of rough piles and wicker-work, will be found useful.

The writer had an opportunity of seeing the principle here advanced tested on two occasions. The first was in the case of a new arch, 25 feet span, over a mountain river, and erected on a very compact limestone gravel foundation. At the downstream face of the bridge the channel was wider than it by about three feet at bottom, and owing to the side slopes it was about 18 feet, at flood level, wider than the arch. There was a weir about 80 yards below the bridge, and the channel opened out gradually still wider down to the weir-basin. The result was, that the floods, which at best were rapid enough, attained a sudden fall on issuing through the arch into the comparatively wide channel below; and a corresponding scouring power was brought to bear on the centre of the channel, just at the downstream face of the bridge. A hole was in course of quick formation, but detected ere it was scooped more than a foot in depth. The channel was immediately reduced to the width of the arch by means of rough hammer dressed side walls, which, after some ten yards below the bridge, were made to open out gradually towards the weir-basin. The expectations formed were perfectly realized—the floods subsequently came through the arch, and for some distance downstream in a comparatively easy incline, producing no further harm. And had the former state of things been suffered to continue, it is probable that in a very few years the bridge would have been reduced to a most precarious position.

The second instance was a small accommodation bridge, some 12 feet span, of rubble masonry, and not more than about eight feet in width between the parapets. It was built over the old course of a mountain river, and was intended only for passing the waters of a small tributary—over nine-tenths of the waters of the catchment basin, being intended to be sent down in a new channel. Just after the completion of the small rubble bridge, and ere the new channel was ready for opening, a flood occurred, which had to be sent round by the old course. The bridge, although fully equal to the purposes it was intended to serve, was altogether insufficient in water-way for discharging the mountain floods of the whole catchment-basin; and the waters rose in consequence nearly two feet over the soffit of the up-stream side. Fortunately, the channel, some 20 yards below the bridge, although deepened, was much contracted in width (not, it must be confessed, through design or in anticipation of an event of this sort, but merely to dispose of the spoil), and the water-way was only about equal to that of the bridge. The result was, there was very little "head water," the difference of level between the flood waters above and below the bridge being only a few inches, and the fresh rubble structure, which, under other circumstances, would be endangered, was quite safe.

It is, perhaps, unnecessary to pursue this simple subject any farther. If the principle treated of be sound, it needs no further illustration.

The questions to which attention is solicited are, whether even a sufficiency of water-way and good masonry in bridges over mountain rivers, are sufficient to ensure their stability, unless the flood waters are conveyed in a comparatively tranquil manner through the arches? and whether the adjustment of the channel adjoining the bridge, as above described, is not the most simple and effectual, if not the only way of effecting this object? Also whether the application of the same means is not calculated, in many cases, to save bridges labouring under defective water-way and masonry? It is not, of course, intended to advocate defects of any kind in bridge building; but it may often be desirable to maintain even a defective bridge, to avoid public inconvenience or the expense of building a new one.

In connection with this subject, it may not be out of place to draw attention to a remark very often made—namely, that the proper provision for water-way in bridges is generally disregarded, or forms but a very secondary consideration with roadmakers. That it has been so heretofore must, perhaps, be admitted to be the fact. In prosecuting the arterial drainage of Ireland, which lay generally in the lower parts of the country, it is well known that most of the bridges encountered were so defective in water-way and other respects, as to involve the necessity of having them taken down and rebuilt; and the numerous casualties we hear of from time to time would lead to the inference, that a want of due attention to similar requisites must prevail, to some extent, in the higher parts also. It is, perhaps, needless to observe, that this state of things is not attributable to the present county surveyors, than whom, it is well known, it would be difficult to find a more intelligent body of men in any profession; and under whose surveillance, we are justified in expecting that due attention shall be paid to the double purpose a bridge should serve; and that whilst making provision for the roadway, the no less essential desideratum of making ample provision for the waterway, shall not be neglected. This latter desideratum, involving the consideration of the extent and physical character of the catchment-basin of each river or stream, is not so simple, as may have been too often imagined; on the contrary, it is calculated to exercise one's reflection and ingenuity, but at all events, it is both necessary and important it should not be disregarded. Curtailing the legitimate cost of a roadway, by making bridges of inadequate waterway and inferior masonry, is questionable economy; and the old adage that "whatever is worth doing at all, is worth doing well," is, perhaps, in no case more worthy of application than in bridge building.

The recent failures of so many bridges on mountain rivers, renders, perhaps, the present time opportune for raising the question as to the cause of those failures; and it is with this view, and not through any impression of being able to meet the subject with any particular interest, that the writer takes the liberty of submitting this brief paper to your notice.

ARCHÆOLOGICAL JOTTINGS.

KILMALLOCK.

> "Thus shall Memory often, in dreams sublime,
> Catch a glimpse of the days that are over,
> And, sighing, look through the waves of Time
> For the long-faded glories they cover."—*Moore.*

THERE are many localities in Ireland well worth the attention of the historian, the antiquary and the archæologist—places famous in legend and full of storied renown. From houses, now ruinous and desolate, there once resounded the clang of warriors, and the eloquence of learned men. From places now tenanted by placid cows, or nibbling sheep, there arose the conflict of armed bands, the roar of cannon, the rattle of musketry, the shout of conquest, or the groan of agony; churches where no longer worshippers kneel—abbeys, once stately, and beautiful even in decay, stud the Emerald Isle, and to a locality rich in all these memorials of departed greatness, we now propose to conduct the reader.

Kilmallock, in the county of Limerick, displays evidence of being a considerable place in former days. Its lordly castles and decayed mansions witnessed many remarkable events. Few places are better calculated to awaken our sympathies with the fallen, reminding the visitor of the transient nature of all sublunary things. A great incongruity prevails: thatched cabins lean against stone embattled mansions; houses once tenanted by nobles are propped up by huckster shops: all bespeak the changes which time and war have made.

At our last visit the town seemed deserted, and Baalbec only equalled it in solitude. Our footfall alone sounded along the empty street, and as we entered the ruined mansions no prying eyes watched our movements, no inquisitive voice disturbed our meditations. We could see the blue sky gleaming over the unroofed dwellings, and our mind wandered back to the days of their splendour, and imagination supplied the building materials, and formed a spacious and picturesque town. The place was anciently called Killochia, Kilmocheallog, and Kilmaloge, whence Kilmallock, or the church of Molock. The absence of records of early ages in this county prevents our tracing its history for several centuries, but the magnificence of the ruins, which obtained for it the proud yet mournful appellation of the Baalbec of Ireland, evince its progress to distinction. All its earlier history is lost in the obscurity of its remote origin, and the interest given to every spot trodden by the feet of the good or the brave, in days gone by, is unfelt. But the massive stronghold of the Anglo-Norman, the castellated mansion of the Elizabethan age, the square lofty fortalice of the Cromwellian adventurer—these are before us, ruined indeed, but their identity perfect.

It was a corporate town, with extensive liberties and municipal privileges, at a very early date of the English in this country. Its privileges as a borough are recited in a charter of Edward III., by virtue of which that monarch granted, to the provost and commonalty of Kilmaloge, certain tolls and customs towards keeping the fortifications in a state of repair. It was defended by a stone wall of great strength, fortified by mounds of earth, and having four gateways, protected by lofty and commanding towers built over them. These were called St. John's-gate, Water-gate, Ivy-gate, and Blosom's-gate, of which only the last is standing. A Dominican friary was founded in A.D. 1291, east of the town, by Gilbert, son of John of Callan, Lord of Offaly, which was richly endowed. It lasted until the general suppression of monasteries, when it was granted by Queen Elizabeth to the corporation. Money was coined here by permission of Edward IV., and in 1483 this is named among the chief towns in which a coin of Richard III., then recently stuck, was made current by act of Parliament. It was selected as a principal military station by the English, and shared all the storms of battle which desolated the country. Being a place of great importance, it was speedily repaired by the English, encouraged by Sir Henry Sydney, Lord Deputy, and that Governor appointed a strong garrison for its defence. It was not destined to much repose; the subjection of Fitzmaurice brought only a short respite of peace, and the clamours of war were anew to shake the walled town.

We ought not turn away and leave behind a place so full of recollections of that once proud and most puissant family of Desmond, without recording something of their origin and their fame, ere their sun, after traversing his restless course, sunk into the obscurity of eternal night for this world. The fate of Rome may be regarded as analogous to that of the fate of the house of Desmond. While her possessions were limited and compact, Rome feared no foe, and resisted all dangers; she governed herself: but when her armies added kingdom after kingdom to her dominions, when her eagle wings reached from the western isles of Europe (ultima Thule) to the realms of the sun, her empire was too great to be controlled by the power residing at Rome, a new seat of government arose at the city of Constantine, the mighty empire tottered with its own weight, and the Roman empire had its decline and fall. Thus fell the race of Desmond!

The family of Fitz-Gerald is .of Anglo-Norman descent, and Maurice Fitz-Gerald, the founder of the family, whence the princely race of Geraldines, including Leinster-Desmond, knights of Glin, Kerry, Mackridge, &c., are sprung, came over with Strongbow. It would be a far cry, and a long chapter, to trace their career, and the various ways and means by which they acquired territory in four counties, extending over one hundred miles, and containing considerably over 600,000 acres of land, of the English acreage. According to Sir John Davis, Maurice Fitz-Gerald, the first Earl of Desmond, raised the greatness of his house by Irish oppressions and exactions; and among the ruins of his boldly situated Castle of Strancally, hanging over the beautiful Blackwater in Munster, still yawns a gloomy chasm, evidently the work of art, sloping down to the river. This is called the Murdering Hole, and the local tradition asserts that, when the lord of the castle fixed his eyes on an estate in the neighbourhood, he used to invite the owner to partake of his good cheer, and when the feast was partaken of, and the wine had done its work on the unsuspecting guest, the assassin's blow robbed the victim of life, and the Murdering Hole gaped to facilitate the plunge of the body in the rolling waters speeding to the Atlantic.

Of the ancient town of Kilmallock, there are yet considerable remains. The castle in which the Earl of Castlehaven kept his munitions of war, yet rears its solid structure, and, underneath its gloomy archway, a road led outside the walls, the direction of which is now changed. On each side of the main street, the eye surveys castellated mansions — or, rather, what once were such — their embattled parapets yet attesting their claim to distinction, and their tall gables, and taller chimneys looking contemptuously down upon mud cabins or gaudy shops in their vicinage. These houses were once inhabited by families of distinction. One of the dwellings within the walls is said to have belonged to the Earl of Buckingham; another to the family of Godsill. The houses in the main street are so well built, and the materials so durable, they are likely to last a long time: indeed, the square window-frames, and spacious fire-places, are so well carved, that the stone-work seems to bid defiance to time, and retains all the impress of the sculptor's chisel in its pristine sharpness. An enemy, more destructive than the tooth of time, however, is at work amid the ruins, and many of the striking features of the past daily disappear, put to some less worthy, though more useful, purpose. Mr. Weld, writing in 1812, observes of the then state of the houses: "The plans are nearly the same; they present two or more gable-ends to the street, and are divided into three stories. The entrances, by spacious portals with semicircular arches, open into small halls, which communicate with broad passages that probably contained the stairs, whence there are doorways leading to the principal apartments. The windows, of a square form, and small in proportion to the size of the rooms, are divided into compartments by one or more uprights, and sometimes by a cross of stone. The chimney-pieces are large and lofty, and the fire-places calculated for containing huge piles of wood." Yet the fires no longer burn, the ashes on the hearths are cold; the generations who lived, and loved, and died, in these dwellings are no more, and even their names have not reached us. Here is a spot for moralizing! The scene of human power, and human pride, is around us—walls that rung with revelry when the board was spread, and the wine-cup quaffed, and the floor swept by the rustling silk of dames, and trodden by the knightly feet of warriors. All is now still and cheerless—the tenants are gone—and the wind of winter, and the summer shower, occupy the place at will.

We turned from the abodes of the stout men-at-arms and industrious burghers, to visit the temples of religion. They are somewhat more respected than the houses of men, for the Irish are essentially a people reverent of the Supreme Being, though passion frequently blinds them to His great attribute—mercy! The remains of the Dominican monastery are well worth minute examination. They are situated near a small river called the Luback, and consist of a lofty square central tower or steeple, and the choir, nave, and part of the transept. The east window is a specimen of the pure Gothic, and the venerable ruins have called forth the admiration of many an antiquary. Sir Richard Hoare observed of this monastery: "It surpasses, in decoration and good sculpture, any I have yet seen in Ireland, but does not seem older than the reign of King Edward III." In the chancel stands the broken tomb of the last White Knight, called so, according to Camden, from his snow-white hair. He was a Fitz-Gerald, one of the powerful Desmonds, and the maternal ancestor of the present Earl of Kingston. Mr. Crofton Croker has copied, from the slab of the tomb, the following inscription:—

TOWER AND SPIRE OF ROMAN CATHOLIC CHURCH, NAAS.

The parish priest, in a letter to *The Freeman*, thus describes this portion of the building:—This evening is one of no ordinary joy in Naas; for our beautiful and majestic spire is completed. It was commenced, seven years since, by my venerable predecessor, the Rev. Gerald Doyle. It is 200 feet high. The style is what is called the "transitional;" that is, what prevailed between "the early English" and "the decorated" periods. The tower consists of three stages. In the first there is a very handsome two-light mullioned window, decorated. In the second stage there are three long lancet windows. In the third stage there are four beautiful two-light tracery windows, the jambs and arches of which are deeply moulded, and have caps and bases. The spire has broaches at its angles, and it too is divided into three stages. In the first there are two-light windows, with deeply-moulded jambs, caps and bases, and canopied heads, surmounted by handsome stone crosses. In the third and second stages there are single-light windows, with canopied head and crosses. The spire is surmounted by a gilded iron cross 13 feet high and 8 feet wide, most elaborately traced. The cross is kept in its position by an iron bar about 30 feet long, which passes through two iron cradles, set into the work, and connected with a weight of nearly one ton, which is suspended over a massive floor. On the cross is a vane, of admirable beauty, in the shape of a cock, remarkable for great richness and lightness combined. The buttresses are very handsome, diminished upon each story by water tables, terminating upon the last stage of the tower. The tower has two handsome, newelled stairways, with chiselled soffits. The bell possesses great softness, delicacy, harmony and power of tone. Mr. J. J. M'Carthy, R.H.A., is the architect.

SANITARY CONSIDERATIONS.

SEWERAGE.

THIS is certainly the *quæstio vexata* of the day; and one so immediately connected with our comforts and health, that the consideration of it should no longer be deferred, because of the difficulty which surrounds it, and which, perhaps, is one of the causes why the evil has not been grappled with and overcome before the present time. No doubt there are other difficulties, such as custom, convenience, fashion, and the dictum of those in power, who uphold the present sewerage system, aided by those around and dependent on them, who, perhaps, fear to differ. But all these difficulties would, we believe, give way before a full development of the ascertained and incontrovertible facts which may now be brought to bear upon the subject. Perhaps, then, there could be few more useful occupations than to analyze the theories and practice of the past and present, and endeavour to make them useful for the government of the future.

When the Metropolitan Sewage Commissioners felt themselves in their first dilemma, and found the covered sewers choking with filth, the open ones redolent with odours, and the River Thames exhibiting unmistakeable signs and significations of what was being discharged into it, they appealed to the public at large for propositions to lift them out of the slough, and some two or three hundred labourers of the day set their shoulders to the wheel. But one shoved in one direction, another in an opposite; one up, another down; some this way, others that; more in ways that the utmost ingenuity could not discover the object of—and the unhappy Commissioners were left sticking in a mass of mud and filth, which has been increasing from that time to the present, and which bids fair to increase until the sewers fill to the brim, and the rivers can hold no more. In the interim, however, three of the leading engineers of the day declared that the existing sewerage system was a wise one, and could not be departed from, but that "intercepting sewers" should be constructed; and the Commissioners of Health decreed that every householder in London should be forced by law to discharge the whole filth of his domicile into the street sewer; that the sewers should be *forced* to discharge the entire into the "intercepting sewer"—water being *forced* into all the sewers in such quantity as was never heard of before, and which, it is to be hoped, never will be again; for few things could be more fallacious in principle and wasteful of water than the so-called "flushing." Designs for "intercepting sewers" therefore became the fashion—nay, the rage—and one of so magnificent an extent was promulgated, that it far outdid the Thames Tunnel; for it was proposed that it should pass *seven* times under the bed of the river, running in a direct line towards the sea. But, fortunately for the citizens of London, the proposition was one of such magnitude that it fell to the ground, crushing the unhappy engineer. He, however, was the only sufferer, except those who had to read, for about twelve months, debates upon a subject which was about as profitless as any that had ever occupied the time of the debaters or the public.

Well, then came the *new* Metropolitan Commissioners, who were at once to cleanse the Augean stable; but they debated so long upon the question, and did so little, that the Government decided upon appointing the well-known "Committee of Referees," whose labours have been handed down, for the benefit of posterity, in a blue book of some 300 pages. But three other engineers, appointed on behalf of the Commissioners, have since, in the most merciless manner, utterly torn it to pieces; and they have so clearly demonstrated to the authorities of the day that "intercepting sewers" are the *ne plus ultra* of perfection, that the Chancellor of the Exchequer has granted to the Commissioners a reward, it may be said, in the shape of £3,000,000, to be expended in any manner they like; and they have decided on sinking it all in "intercepting sewers" accordingly.

Such are the simple facts of a ten years' battle; the results to the public of London being, that they have to pay £3,000,000 for the expenses of the war—that the sewers of the metropolis are fuller of filth than ever—that, according to the Chief Commissioner's statement to the Chairman of the Board of Works, the removal of the matter from the sewers, where they became useless by being choked, was, last year, considerably above £200,000, and was daily increasing—and that the river has become so inundated by filth and noxiousness, that passengers sicken! and bargemen die! whilst the windows of the Houses of Parliament are obliged to be closed up by "chemically prepared canvas," to intercept the poison of the atmosphere.

Would it not be well, then, that in Dublin, and Ireland generally, we should take warning by what has been done, and left undone, in the metropolis of the world, and not pin our faith, as we have been doing, upon the dictum of its public bodies, who, it can scarcely be doubted, have plainly shown their views to be wrong. It may be fairly asked, if they were right, would the Thames be in its dreadful state of noxiousness? and would its sewers be so filled with foulness, that some £150 *a-day* has been expended for *lime* to cast into them, with the hope of arresting the discharge of their fatal gases? If there were no other cause for awakening us to our own position, this fact alone should do so; because it must be plain to all who give thought to the subject, that this great question of sanitary advancement has but little chance of successful issue, if it be left in the hands of those who could adopt so utterly fallacious a means for acccomplishing the required end—namely, *the discharge of the matter of the sewer, in a purified state, into the river*—the avowed and attempted object.

The merest tyro in town drainage should know—first, that the action of lime upon night-soil afloat in sewers is, *at once to precipitate it to the bottom*, and, next, that whilst being precipitated, the usual gaseous products of the decomposing matter *are acted upon and fully liberated from*, in place of being held, as they otherwise would be, *in* the matter and the water, until gradually evolved. Thus the course taken, at the cost of £150 a-day, was to choke the sewers with a *concrete* formed of lime and animal matter (than which there could scarcely be found a more perfect water cement), and to discharge at once into the atmosphere the whole of the deleterious emanations.

It is scarcely necessary to remark upon such facts. But surely it cannot be expected that where utter want of knowledge of the elements to be dealt with has been thus plainly exhibited, that the same powers of conception will be adequate to devise means for curing an evil, of the cause and foundation of which, that conception is so ignorant. Will the physician cure the disease of which he does not know the origin?

No more will the engineer be successful whilst ignorant of the foundation he has to build upon. Hence, then, the necessity to learn and investigate what are the causes which produce the necessity for improvements in our sewerage system; and, with permission, we shall go, step by step, into the investigation.

THE NEW NATIONAL GALLERY.

A STATUE OF THE QUEEN!

WHATEVER may be our opinion as to the acquisition, in an artistic point of view, of the structure now in progress of erection on the lawn of the Royal Dublin Society, we regard with pleasure the event which took place on the 29th ult., when the corner-stone of the intended repository for our national fine-art treasures was laid, and the long talked-of undertaking thereby rendered *un fait accompli.* Exteriorly it is to harmonize in style with the corresponding wing erected for museum purposes by the Society, after designs gratuitously furnished by Mr. Clarendon; but according as the building progresses a very palpable awkwardness, owing to the nature of the site, will gradually develop itself. The wings are laid out parallel, but the Society House, which forms the back-ground, or third side of the quadrangle, is not at right angles thereto, but presents an acute angle to one wing, and an obtuse to the other. Some taste and judiciousness may now be well displayed in the laying out of the space between the wings, and we heartily unite in the opinion of the correspondent of our able cotemporary, *The Builder*, who, in describing the structure, concludes by saying, "here is a glorious site for a few statues of eminent men." So intimately has the site been identified with an important era in our national history, already commenced to be in part perpetuated by the association of the "Dargan Testimonial" with the National Gallery, that it may not be amiss to suggest, that a worthy claimant for a pedestal is the distinguished individual who was graciously pleased to honour the Exhibition with her presence—need we say we mean Her Majesty the Queen!

Strange that, with all the boasted loyalty of her Majesty's subjects in this realm, our metropolis does not even contain a single memente of either of her visits, whether statue or otherwise; and a favourable opportunity now presents itself, which, if taken advantage of, will both advance an artistic object, and serve to cement stronger the good will which is happily becoming more and more apparent between the sister isles and our own.

The following is a brief outline of the history of this project, to which we also add a few particulars of the new structure:—

At the close of the Great Exhibition of 1853, the public sense of the services of our fellow-citizen, William Dargan, in connection with that exhibition. expressed itself in the formation of a committee charged with the erection of some testimonial in his honour; and for this purpose a public subscription was accordingly set on foot. The committee after much consideration, resolved to devote the amount of the Dargan Fund to aid in the foundation of a National Gallery; and the committee of the "Irish Institution" received with satisfaction the announcement, that as soon as fit measures were taken for the formation of a permament public body, proper to carry out the trust, and a fitting site secured, the sum of £5,000 should be placed at their disposal. To carry out the necessary conditions, was the next immediate object of those who took an active interest in the "Irish Institution." The Royal Dublin Society had in 1853 resolved on the erection of extensive buildings for the accommodation of their Museum of Natural History. A committee of the institution, appointed to consider the various sites in Dublin proper for a National Gallery, reported in 1854 that the best site available would be that of Leinster-lawn, Merrion-square, if the consent of the Dublin Society could be obtained to the occupation of a portion of it for the purpose. Conferences accordingly took place between the committee of the institution and the council of the society, and the result was that the society, showing the most friendly desire to aid in the objects proposed by the institution, unhesitatingly agreed to give up a portion of the lawn for the National Gallery, provided only that the building might be made to correspond externally with their new Museum, the former occupying the northern, and the latter the southern side of the lawn, so as to leave the open space of grass and pleasure-ground unbroken between the Society House and Merrion-square. The arrangement having been agreed to, the plans for the museum were immediately altered accordingly, and the erection of that building postponed for a short period, in order to allow time to procure the necessary means to defray the expenses of the gallery. In accordance with the design agreed upon, bills were introduced, and the governors and guardians of the National Gallery of Ireland are now incorporated under the act 17 and 18 Victoria, cap. 99 (10th of August, 1854), amended by that of the 18 and 19 Victoria, cap. 44 (2nd of July, 1855). The acts provide, in the first place, for the erection of the intended building; and as not only the objects of different parts of the building are different, and the authorities of the library different from those of the gallery, but also the sums to be applied to the expenses of the work are to be derived from different sources, the trust, so far as the erection of a proper edifice is concerned, is specially committed to five building trustees named in the act. These are—the Earl of Charlemont (the President of the "Irish Institution"), Richard Griffith, Esq., LL D. (Chairman of the Board of Works), Colonel Larcom (the Under Secretary), and George Roe and Thomas Hutton, Esqrs., both active members of the committee of the Dargan Testimonial; the former having also acted as chairman of the committee of the Exhibition, in 1853.

The machinery being thus perfected, it remained only to obtain the necessary means to complete a building large enough for the purposes contemplated. A rough calculation, made after the estimates for the corresponding edifice to be constructed for the Royal Dublin Society had been framed in detail, satisfied the committee of the institution that the necessary building could not be finished, even in the plainest form, for less than between £10,000 and £11,000; while the Dargan Fund, will not, it is believed, supply more than £5,000. Under these circumstances, the Government approved of a grant of £6,000 in aid of the undertaking. Of this sum one-half, or £3,000, was voted in the estimates of 1855, and the remaining £3,000 was included in those of the last session (1856).

An additional grant of £5,000 was made by parliament in the last year, it having been ascertained that a larger sum was requisite to enable the trustees to commence the erection; bnt it seems to us that the Government purse strings will have to be opened still further, for we have reason to know that the expenditure of the building will exceed £24,000 instead of £12,000 as stated. It is, however, a notable fact that in the case of The National Gallery of Scotland, recently established, a sum of £30,000 was granted by parliament in several successive votes between the years 1847 and 1858, independent of a sum of £20,000 previously devoted by the Board of Manufactures of Scotland, whose funds are under the control of the Treasury.

A portion of the building will be devoted to the reception of Archbishop Narcissus Marsh's library, which at present occupies an obscure position near St. Patrick's Cathedral; and internally the National Gallery will comprise, on the ground floor, a sculpture hall, to be called the Dargan Hall, 114 feet in length, by 40 feet in width, by 23 feet in height; and a library apartment of 91 feet by 40 feet, in which the volumes of Marsh's library are to be placed. At the end of the sculpture hall a splendid staircase will lead to the great picture gallery, which will be 126 feet in length by 40 feet in breadth. In a portion of the building is introduced a second library apartment, and some officials' rooms. The galleries will afford much greater space for the display of artistic works than those likely to be available in the first instance. Externally the building will have chiselled granite rusticated basement, blank windows, with Portland stone dressings, and ornamental frieze and cantilever roof. The probable cost of construction will be £24,000. Messrs. Cockburn and Sons are the builders.

RESTORATIONS AT ST. PATRICK'S CATHEDRAL.

FOR many years past a series of works has been in progress with a view of saving from total dilapidation this tottering fabric, and so completely has it been metamorphosed by the different hands to whose care the restorations have been entrusted, that excepting the main walls, comparatively few of the chief features of the original venerable edifice remains.

Much more, however, still is required to be done, to save portions from certain if not speedy ruin; the southern transept and wall of nave being in a precarious state, although the latter—which is alarmingly ont of the perpendicular—has been underpinned, and massive limestone piers built to sustain the arcade on which an enormous superincumbent mass presses, and which, unless *taken* down, we predict is pretty sure to *come* down, drawing with it the framed timber roof, crushing the southern aisle and adjoining portions, and effecting an amount of damage impossible to calculate. Some of the chief works executed of late years comprise the lowering, by several feet, of the floor of nave where service is performed, the tiling thereof and newly facing of piers; the complete remodelling of the furniture, including pews, choristers' benches, lecterns, &c., which are now constructed in framed and panelled oak wainscot of an appropriate and substantial character. New doors of similar material and corresponding design, and ornamental iron railings have likewise been added. Several of the old monuments have been shifted from one position to another, and two effigies—one evidently that of a Knight Templar—recovered from beneath the floor of the nave, have been fixed in the west-end wall at either side of entrance doorway. A very beautiful mural monument and stained glass window, in memory of the fallen officers and men of the 18th Royal Irish, are of recent construction, and with the tattered banner of the regiment hanging close by, are features of considerable interest in the northern aisle; as also is a monument in the northern transept, erected to the deceased members of the late Master Goold's family. At the east end a new chapter-house—not yet finished—has been in course of construction, and on plan is three parts of a cross, with ranges of slender clustered columns, consisting of a central shaft of Caen stone and detached columns of Kilkenny marble, sustaining moulded-ribbed arches, forming a groined ceiling, with bosses at the intersections. The windows lighting this portion are all lancet-headed, and have deeply-splayed jambs, detached shafts, hood mouldings, &c., and are intended to be filled with stained glass.

Exteriorly, the recent additions and restorations are rendered doubly conspicuous by the crumbling state of the main building, which, we are informed, was—with the exception of the tower—built in the worst manner and of the most perishable materials, a very unusual circumstance in our ancient buildings. New buttresses, to sustain the tottering portions, have been introduced, and in some instances built on the foundations of others, and in such incongruous positions, as clearly to prove that the work of patching and propping is some centuries old. The ground at the east end has been considerably lowered, and the site cleared, thereby affording a better view of the building. The chapter-house and new buttresses, &c., introduced throughout are built of Skerries limestone, with Caen stone for dressings, &c. We hear it is in contemplation to form a new roadway from the Close at the eastern end to the space at the southern transept, so as to ensure a carriage-drive all round the cathedral, which will be a great improvement.

The various works of comparative recent date, including the erection of the new chapter-house, have been carried out by Mr. Kingsmill, builder; and we trust that the attention of the public may at once be awakened to the necessity of saving this, one of our few national monuments, from the ruin which threatens it.

THE BUILDERS' ASSOCIATION AND THE ARCHITECTS OF IRELAND.

Our readers are already aware that an association has been recently formed in our city, with the view of establishing a uniform and legitimate course of practice amongst the members of the Building business, to protect their general interests, reform existing grievances, &c., &c. At the first quarterly general meeting of this association it was unanimously resolved to prepare an address to the architects practising in Ireland, and solicit their cooperation towards the attainments of the objects in view. That document is now before us, and serves to illustrate the desire for a maintenance of good feeling between architect and builder, which even at this early stage distinguishes the principles which the association has laid down for its guidance. Without entering fully into every item, we specially call attention to those relating to the general ambiguity of architects' specifications as regards "the undefined depths of foundation," and the assumption by the architect of the office of umpire—from whose decision there shall be no appeal—in the event of a dispute between the client and his builder.

With reference to the former, we must remark that there are exceptional cases in which such a clause is omitted, and a defined datum given, any extra depth necessary being allowed for by measurement; but, as the association suggests, it would save much misunderstanding and litigation if this practice were *generally* adopted, and the onus of providing a secure foundation at *any* depth and under *any* circumstances not thrown on the builder, to his possible ruin in many instances. As to an architect constituting himself a court of justice, from whose decision there shall be no appeal, it is a palpable absurdity, and the law of the land—however stringently worded an agreement may be—would not recognise it; nevertheless, architects *do* insert such a clause, and the sooner it is omitted the better for the sake of common sense. Another important point to which the builders refer is, that "they should be paid for their estimates where no tender is adopted." Unless in special cases, we hardly agree with them as to the consistency of this, as a proprietor may—when instructing an architect to prepare plans and receive tenders—be fully determined to proceed with the work, and, unforeseen circumstances intervening, he may be prevented from doing so. If, therefore, 20 or 30 builders (as is often the case for work of importance) choose to send in tenders, and incur trouble on the chance of success, it would be the height of inconsistency to expect that each should be paid for his estimate. But where tenders are sought for merely with a view of obtaining information, or deciding the fairness of an estimate previously received *sub rosa* from a party to whom the work is to be given, then, and then only, should payment be demanded and insisted on from a proprietor.

We invite attention to the document in question, and wish the association every success in its laudable efforts to progress.

OPENING OF THE HARCOURT-STREET TERMINUS—DUBLIN AND WICKLOW RAILWAY.

The new pile of building, forming the terminus of the Dublin and Wicklow Railway at the upper end of Harcourt-street, is completed, and has been opened to the public. Although not of as costly, extensive or ornate a character as some of the other termini built of late years in our city, nevertheless this building is distinguished for its appropriateness, the convenience of its internal arrangement, and the solidity of its construction. The entrance-hall is a lofty apartment, 88 feet by 25 feet, approached under a double archway, situated in a central gable terminated by a pediment; and thence branch two distinct flights of steps, 11 feet in width, conducting first, second, and third class passengers respectively to the platform. A parcel-office, 41 feet 6 inches by 25 feet, a booking-office, 19 feet 6 inches in width, and a clerk's office 25 feet by 20 feet 4 inches, are provided likewise on this storey. The entire frontage is 128 feet 10 inches. On the first floor are porters', first and second class ladies' rooms, with ante, men's apartments, station master's office, &c. Exteriorly the building presents a central gabled projection carried up two storeys, with one storey wings at either side, having four windows in each, surmounted by a cornice, and with quoins at the angles; but at some distance behind rise two wings same height as central gable, having oval-shaped windows, and capped by a main cornice, and blocking of peculiar character; the height being 42 feet. The material used throughout for walling is hammer-dressed black stone, with chiselled granite for dressings, cornices, quoins, &c. The platform roof is 58 feet 6 inches span A shape, and similar to that at the Kingstown terminus, with trusses 8 feet apart, principal rafters, three rows of purlins, each side made with T iron, about 4½ inches deep, and ½ inch thick, to carry 1½ rebated red deal boarding, &c. The goods' stores in connection with this building, are of extensive character, and sundry works are still in progress. Mr. Wilkinson is the architect, Mr. Cunningham, the contractor. It is considerably less than twelve months since the first stone was laid. It must be highly gratifying to the directors that no unnecessary delay has occurred in the construction of this building, which fully and completely answers the requirements for which it has been designed, and also forms an important addition to the street architecture of the section of the city wherein it is placed.

CHURCH OF ST. CONLEITH, NEWBRIDGE.

In the year 1847 the foundation stone of this Gothic church was laid by the Right Rev. Dr. Haley. It is built in the style known as the early Norman gothic, and consists of a nave, choir and sanctuary; a fine bold tower which has nearly reached its intended elevation stands at the northern end facing the road. The walls are pierced by ten double lancellated windows by which the body of the church is lit, and above the altar at the southern end a beautiful window with richly carved stone mullions supplies a soft and subdued light through exquisite stained glass with which it is furnished. A highly ornamented stone cross stands on the apex of the gable above this window. The ceiling is of open wood-work, stained and varnished, and the cross beams are carved to suit the other decorations of the building. The sanctuary is divided from the choir by an arch which spans the entire width of the church and rests upon a cluster of semicircular pilasters at either side. The walls surrounding the sanctuary are covered with carved screen wood-work, and the window over the altar above referred to is highly decorated with designs of fruits and flowers in stucco. The stained glass in this window is the gift of J. O'Donohue, Esq., of Rosehard house, and represents full length figures of St. Bridget and St. Conleith. The upper section contains the figure of our Blessed Lord, and the smaller compartments are filled with Christian emblems. The altar, which is of varied-coloured marble, has been manufactured by Mr. Kirwan of Bolton-street. The front is divided into three compartments by pillars of white marble. The panels are of rich brown porphyry from Mitchelstown, County Cork, highly polished. The mouldings and cornices are of green Connemara porphyry, and the table of the altar is composed of one slab of Italian veined marble, over eleven feet long by three feet wide. The tabernacle is made to represent a temple, above which a number of highly polished pillars support a circular plane on which is placed a splendid bronze crucifix of the Mediæval pattern. The tabernacle is composed of white Carrara and yellow Sienna marbles. The door, which is made of the latter, is adorned with a monogram of the Holy Name, most cleverly executed in white marble.

Artistic Zinc Labels.—We have seen some labels in the "ogee" style, executed for commercial and other houses in Belfast by Mr. G. L. Hill, engraver, of that town, which, in point of design and finish, supersede anything of the kind before met with.

THE DUBLIN PHOTOGRAPHIC SOCIETY.

AT a recent meeting of this body—the first since its affiliation with the Royal Dublin Society, the chairman Gilbert Saunders, Esq. addressed the following remarks relative to this charming art:—Photography is a new branch of art, and, like all new things, had its difficulties to contend with. It has the defects arising from imperfect knowledge of some of its principles and the prejudice which antiquated notions always oppose to progress. We claim for photography no more than its merits. It is not creative, like high art—it is merely imitative, but then its imitations are truth itself. It was natural to expect that so marvellous a discovery as that a picture of exquisite minuteness of detail could be obtained by unskilful hands in an almost inappreciable period of time should startle the senses of the artist who had acquired his powers only by the closest application, and lead him to despise the royal road to picture painting which photography opened up. But such impressions are fast disappearing before the force of conviction. The unskilful hand can make nothing of photography—there must be skill and talent employed in photography as well as in every thing else. The artist himself has learned to appreciate an invention which will abridge his labour, and save his most valuable time, and many now find it their steady friend if properly understood and rightly applied. Photography, it is true, has interfered with some individuals and some branches of the artist's profession, but in most cases it has merely forced the professor to take it into partnership with him, and which has generally resulted in more profitable employment. Printing, when it was first introduced, must have had many opponents amongst the class of persons who gained their support by copying books. No doubt they regarded the printing-press as an enemy; in fact they denounced it as an infernal invention sent on earth to deprive them of bread. We know the result has been the very reverse, and that for one writer who found employment in those days there are thousands now. Ancient draughtsmen may have regarded engraving in the same light, and lithography in its turn affected engravers. But it has always been the case in every discovery in arts and sciences tending to lessen labour and abridge time, that whilst it at first appears to deprive labour and talent of their just reward, the facility of reproduction invariably increases the demand for the talent it in the first instance displaced. Photography is no longer a philosophical wonder; it is a well-established branch of art, though but in its infancy. Its influence is being felt in every direction, and what its ultimate destiny may be, no one can foretell.

BAS RELIEFS FOR THE WELLINGTON TESTIMONIAL.

THE sculptured panels for the pedestal of the testimonial—familiarly known by the appellation of "the over-grown milestone"—in our Phœnix Park, are advancing towards completion in the hands of the sculptors who are respectively engaged thereon, viz., Mr. Joseph R. Kirk, Mr. Farrell, and Signor Benzoni. We had very recently an opportunity of inspecting that at the studio of the former gentleman, which is illustrative of the siege of Seringapatam, and is 35 feet in length and 8 feet high; the Duke surrounded by his aides-de-camp directing the operations forming a prominent and central feature, and the likeness being admirably carried out. We shall again revert to these more fully when the models are in a more complete state, previous to casting, which we believe will be effected at Woolwich.

Correspondence.

MOORE TESTIMONIAL—PEDESTAL No. 2!

TO THE EDITOR OF THE DUBLIN BUILDER.

SIR—Never, perhaps, was the old adage "*there seldom comes a better*," more truly exemplified than in the case of the recent miserable attempt to remedy the palpable unsuitability of the pedestal for the statue, and, I may add, the statue for the pedestal, of this national monument. If the original pedestal were disproportioned to the figure, it had at least the merit of being consistent in its parts and details, and, viewing it independently, left little room for criticism; but now, by way of improvement, we have a squat, blocky, ill-shaped mass of stonework, with a low plinth and moulding, out of all proportion; chamfered angles and a cornice (*save the mark!*), composed of two flat bands or facias, one projecting beyond the face of the other, and devoid of any moulding whatever. The figure now is gigantic in its proportions—preposterously so considering the diminutive stature of the original, whom it is intended to represent faithfully—and conveys an idea precisely the reverse of truthfulness I am told that the head has been raised three inches; if so, the alteration is imperceptible, and it would have been an advantage were it raised three inches more. With regret must every one of discrimination pronounce the entire proceeding a failure, involving both a useless expenditure of some £1,500 or more, and entailing a stigma on our national taste, for which there is but one remedy—viz., "the total removal of both statue and pedestal;" and which, if not now insisted on by the public, is sure to be done by the next generation.

LYNX.

Notes of New Works.

The works for the new club-house for the Kildare-street club have been commenced; Messrs. Cockburns' tender in a limited competition being accepted The building is to occupy a site at the corner of Kildare and Leinster streets, the frontage in the former being 134 feet, and in the latter 63 feet. The materials to be used are red brick, Portland stone, limestone, and granite. The accommodation will consist of, on the ground floor, coffee-room, and morning room, each 60 feet by 30 feet; waiting-rooms, private dining and dressing, two billiard-rooms, and small smoking-room, with racquet-court in the rere; on the first floor, library, card-room, writing-room, a third billiard-room, a committee, and a large smoking-room. On the second floor, and in a partial mezzanine, twenty-two bed-rooms, and bath-rooms, &c., the bed-rooms averaging 20 feet by 13 feet, are provided. The windows, externally, will have columns of Drogheda limestone, with carved capitals of Portland. The arches will be of granite and Portland, with carved hoodmoulds of limestone. On Leinster street front there will be an oriel window extending to the height of two storeys. The style of architecture adopted is Byzantine.

A competition has recently taken place here, which is noticeable as indicating a better feeling on the part of the public in such matters. The Commercial Hall Company invited four architects to compete for their proposed warehouse in Grafton-street, agreeing to give the author of the approved design the carrying out of the work at the usual five per cent., and also to present £10 to each of the other three competitors, as some compensation for their expense in competing. Though it must not be supposed that the sum of *Ten Pounds* was an equivalent for the time lost and expense incurred in making a design for such a building as this, still the profession generally is indebted to the Commercial Hall Company for a step in the right direction. The architects competing were Messrs. Geoghegan, Rawson Carroll, Carmichael and Jones, and Ferguson. Mr. Carroll's design was accepted by the Company; and though his estimate was not the lowest, still it was considered his plans could be carried out for a lower sum than any of the others. The site of the new mart is on the premises at present occupied by Messrs Switzer and Beatty, as also the two houses adjoining; and there will be a frontage likewise in Wicklow-street similar in style to that in Grafton-street, which will be of Italian character.

New draw-bridges are to be built over the Boyne at Drogheda. Sir John M'Neil, C.E.

It is proposed to erect a new Music Hall at Londonderry.

We have much pleasure in observing that, in addition to the numerous first-rate business establishments which already, by their ornamental exteriors, adorn the city of Derry, a new drapery and silk mercery warehouse is about being opened by the Messrs. Alexander and Rankin, at the head of Shipquay-street. Mr. William Stirling, painter and glazier, Pump-street, has recently fitted up the shop windows with two splendid panes of plate glass, one for each window, of the extraordinary dimensions of ten feet by six each, or sixty square feet of glass. These are the largest to be met with in the city. There is not a town of its size in the kingdom can boast of better or more ornamental shops than Derry.

The Coleraine new Town Hall has just been completed, and adds greatly to the appearance of the town. The outside walls are of cut stone, while the design of the entire structure is exceedingly chaste, reflecting the greatest credit on the architect, Mr. Turner, of Belfast, as well as on the contractors, Messrs. M'Laughlin and Harvey, Belfast. It appears that a sum of £4,146 19s. 10½d. has been expended on the building, the difference between which and the original contract of £3,021 has been expended on extras consented to by the board.

We understand that new arrangements are taking place relative to the proposed buildings at Mount Argos, near Kimmage, Co. Dublin, involving a change in the superintending architect, and a material deviation from the original plans sent from Rome, and for the execution of which Mr. Hugh Kelly had been declared the contractor, for a sum exceeding £10,000. When the matter is finally settled, and the amended plans decided on, full particulars shall be given.

The first stone of a new convent for the Loretto nuns has been laid at Omagh.

A new organ is to be placed in the Catholic church of Newcastle West, Co. Limerick.

A new organ, by Messrs. Telford, Dublin, has been placed in the Franciscan church, Carrick-on-Suir.

On the western bank of the river Roe, midway between Newtownlimavady and Dungiven, may be seen crowning the hill-top, a large edifice, recently erected in a very neat and ornate, though unique, style of architecture. It is a male and female school, and teachers' house combined, built during the last year by the ex-High Sheriff, S. Maxwell Alexander, Esq., at the cost of about £500; and, besides that, he guarantees to the teacher £20 per annum, in addition to what he may receive from the National Board.

Two separate buildings are to be erected at the South Dublin Union Workhouse. Mr. William G. Murray, architect.

A new bridge is to be erected on the site of the old wooden bridge across the river Leitrim, at Wicklow, according to one of three plans—viz, No. 1, a stone bridge, not to exceed £3,500; No. 2, a stone bridge, not to exceed £2,700; No. 3, an iron bridge, not to exceed £2,500. Clash bridge is to be removed, and the three wooden bridges at Luggelaw are to be rebuilt, with stone arches.

The Mullingar Gas Company have advertised for plans specifications, and estimates, for the necessary buildings, works, and mains.

New schools have been built at Tourneena, Co. Waterford.

The heating and ventilation of the Nisi Prius Court causes much annoyance to the members of the Bar, and the Chief Baron facetiously appointed Mr. Fitzgibbon, Q.C. (the senior practitioner) as "controller of the pipes," to direct proper attention of the court officers thereto.

Progress of Ecclesiastical Architecture.

The last report of the Ecclesiastical Commissioners for Ireland for the year ending August, 1858, states that the sum appropriated at the usual special meeting of the board in December last, for the several church works of this year, amounted to £43,764 10s. 3d. Of this sum £7,608 18s. 1d. has been applied towards the completion of thirteen new churches, and the enlargement of four churches for which grants had been made in former years; £8,690 towards the building, or rebuilding of eleven parish churches, and the enlargement of sixteen; and the residue, amounting to £27,465 12s. 2d., was set apart for the repairs of churches, and for fencing of churchyards, including the expenses connected with the carrying out of these several works. The commissioners have been enabled this year to appropriate a larger sum to the building, enlarging and repairing of churches, than was expected. The sum received this year from private sources was £8,787 10s. 8d., which is for the most part applicable to the building and enlargement of churches. The following churches have been erected altogether by means of private funds:—a district parochial church at Errislannin, parish of Omey, diocese of Tuam; a chapel of ease at Annarea, in the parish of Kilmore, diocese of Armagh; a like chapel at Grenane, in the parish of Moville, diocese of Derry. The two latter have been erected under the superintendence of the architect of the board, who has lately furnished plans for churches also proposed to be erected by means of private funds, in the parishes of Monkstown, in the diocese of Dublin; Kilshane, diocese of Cashel; Rathcooney, diocese of Cork; Croghan, diocese of Elphin.

A new Roman Catholic church has been built in the northern suburbs of the town of Tipperary. The dimensions are, 156 feet in length by 62 feet in breadth. The style is Gothic, of plain character. At southern angle is a tower resting on four massive arches—ascended by a spiral stairway, reaching the landing under the bell-chamber, which is lighted by four windows—and terminated by a spire, which attains an elevation of 160 feet. The principal doorway has splayed jambs, ornamented with pillars fluted horizontally, and over same is a great lancet arched window. Interiorly the arrangement comprises nave, aisles, and chancel—the two former being separated from each other by a double row of cylindrical columns of highly-polished granite, with moulded caps and bases, and supporting arcades, the spandrils over which are pierced with rows of rectangular windows. The chancel has one great arch next nave, also a fine window, intended, we believe, for stained glass: and a decorated rood-screen will extend upwards behind the tabernacle. The church is already roofed, and progresses towards completion.

The new church of St. Mary, Arklow, now erecting from the designs of Mr. Patrick Byrne, architect, is in the Italian style, and measures 120 feet by 80 feet at the transepts, and 40 feet in the nave, the plan being a Latin cross; has panelled ceiling internally, and pilastered front externally, with tower and cupola, rising 100 ft.

No decision has as yet been arrived at in reference to the competition plans for the new church and buildings for the Molyneux asylum. We understand sixteen sets of plans were sent in, four of which have been selected for further consideration, &c.; one of these will be adopted. Rumour names the probable successful competitor, but we abstain from giving it publicity.

A new Roman Catholic church is to be erected in the new town of Ardagh, and the Dowager Lady Fetherston has granted a free site. A police barrack and model cottages have been lately built. The ruins of one of the most ancient cathedrals in Ireland, St. Mel, are a conspicuous object in the town.

The Rosses church, near Sligo, has been built by subscription, and is now ready for divine worship.

It has been determined on to erect a new Roman Catholic church in Dundalk, between Bridge-street and Linenhall-street, at the rere of the old Market-house.

Sundry works are to be executed by the Ecclesiastical Commissioners at the churches of Errislannon and Lickmolash, Co. Galway, for which tenders are being sought.

The corner-stone of the new church of the Immaculate Conception, in the parish of Aglish, Cork, has been laid.

A new church for the Baptists congregation is about to be erected at Kenilworth-square, Rathmines. Mr. Carson, architect.

Railway Matters.

Mr. Lefanu, C.E. reports that "on the Tullamore and Athlone extension — length 24 miles — the contractor is actively engaged. The heavy cuttings and embankments near Tullamore, Clara, and Athlone, are nearly complete; and the other works are far advanced. Nearly 16 miles have been brought to formation level. The laying of the permanent way is commenced, rails and sleepers for that purpose having been delivered at Tullamore. 1,580 men and 183 horses are employed on the works. The station and goods-store at Athlone are in a forward state. Five bridges have been completed, and 14 others are in hands. 61 culverts have been built, and 10 in course of construction;" also "that on the Mallow and Fermoy Railway — length 17 miles — the works, with the exception of the Kilcummer viaduct over the river Awbeg, are in a still more forward state, three-fourths of the earthworks being finished, 13½ miles brought to formation level, and 5½ miles ballasted. The arching of the Carrig viaduct will be commenced immediately, the western abutment and one pier being complete, and all the other piers in a forward state. One abutment and three piers of the Kilcummer viaduct are in hands, and the contractor will make rapid progress with this work. 630 men and 40 horses are employed on the works. Ten bridges have been completed, and ten others are in hands; and thirty-three culverts have been built.

The Banbridge and Scarva line is completed, and a handsome station built from designs by Mr. Lanyon, C.E., architect, &c.

The rails have been laid on the bridge which is to convey the Belfast and Downpatrick line over the Annacloy river, and a steam engine has passed over it. The remainder of the rails, about a mile and a quarter in length, will be laid in a short time. The station at this end, according to the plan, will be a very handsome building. A temporary structure of wood will be erected, so that the public may have the benefit of railway communication to and from Belfast as soon as the line passes the government inspector. In all probability, it may be open to the public by the beginning or middle of this month.

THE LIFFEY BRANCH LINE.—The standing orders have been declared complied with. The following resolution relative to the objectionable features treated of in the February No. of THE DUBLIN BUILDER was unanimously passed by No. 1 Committee of the Municipal Council:—That the committee advise the corporation not to offer any objection to the proposal of the railway company, provided that, in addition to the arrangement agreed on between Messrs. Nevile, Halpin and Hemans, C.E.'s, the directors will insert in the proposed bill clauses to oblige them to construct contemporaneously with the addition to the railway, pontoon or swivel-bridges having a double carriage way at Sheriff-street, and Mayor-street, and not less than 30 feet in breadth; and provided they also erect a swivel-bridge of similar width over the canal at the North-wall, and that such alterations be made as will remedy the dangerous elevation of Newcomen-bridge, and secure a convenient passage across the canal and contemplated railway at Amiens-street, on the road to Clontarf.

TENDERS

For the erection of a new club-house for the Kildare streets Club at the junction of Kildare and Leinster-streets; Messrs Deane and Woodward, architects:—

William Moyers	£34,000	0	0
John Butler	27,041	0	0

Office—No. 73, GRAFTON-STREET, Dublin.

Prospectuses sent free by post.

EARLY PAYMENTS FOR LIFE ASSURANCE VERY CONSIDERABLY REDUCED.

It frequently happens that Heads of Families would wish to make a larger provision for those dependent on them than they find they can afford to do when required at once on Assuring to pay the full Annual Premiums. To meet such cases, and to enable provident persons to procure Policies at the Low Premiums charged for Young Lives, the Directors of

THE PATRIOTIC ASSURANCE COMPANY have resolved to charge, when required, *only One-half of the First Seven Years' Premiums* on Participating Policies, the other half being allowed to remain Unpaid at Interest as long as the Policy-holder pleases.

FIRST YEAR'S PAYMENTS FOR £500 POLICIES,
Allowing Participation in Profits.

Age 20.	Age 30.	Age 40.	Age 50.
£4 18 0	£6 1 0	£8 10 0	£11 13 6

Life Policies involve payments of large sums of money at distant periods, and it follows that by far the most important point to be ascertained by an intending assurer is, that real security will be afforded him. The element of security is all-important in assurance transactions, and yet 37 English Companies are winding up in the Court of Chancery, and 22 English Companies last year transferred their business.

The CAPITAL of the PATRIOTIC ASSURANCE COMPANY OF IRELAND is *ONE MILLION FIVE HUNDRED THOUSAND POUNDS*: complete security is thus afforded.

The Regulations of the Company are very liberal.

No charge is made for Entrance Money, Medical Fees, or Policy Stamps.

THIRTY DAYS are allowed for Renewal of Life Policies, and the Assured are held protected during these Days of Grace.

LOANS are ADVANCED on Approved Personal Security, in connection with Life Policies, without Money Bond or Warrant being required.

PATRIOTIC ASSURANCE COMPANY,
FOUNDED 1824,
CAPITAL £1,500,000,
HEAD OFFICES, 9, COLLEGE GREEN, DUBLIN,
With Agencies in the Principal Towns in Ireland.
J. MONCRIEFF WILSON,
Secretary of the Company.

REDUCTION IN THE PRICE OF GAS.—Notice is hereby Given that the DIRECTORS of the ALLIANCE and DUBLIN CONSUMERS' GAS COMPANY have this day REDUCED the Price of Gas to FOUR SHILLINGS and NINEPENCE per Thousand Cubic Feet.

By Order,
JOHN STEVENSON, *Secretary.*
114, Grafton-st., 1st Jan., 1859.

GAS FITTINGS.—The ALLIANCE and CONSUMERS' GAS COMPANY, expecting that the reduced price of Gas, added to its many other advantages, will produce a largely-increased consumption, and consequently involve the necessity of putting up additional Fittings, have made arrangements for meeting the requirement of the Public in both respects.

Their SHOW-ROOMS are amply stocked with the Newest Designs in CHANDELIERS, BRACKETS, HALL and LOBBY LIGHTS, &c.; and they specially invite an inspection of their GLASS LUSTRES, to the selection of which they have given particular attention.

114, GRAFTON-STREET.

To Architects, Engineers, Artists, and Amateurs.

WM. M'CLEARY WIGHTMAN, PRINTSELLER & ARTISTS' COLORMAN,
22, *NASSAU-STREET*,

Has always on hand a large and varied Stock of Drawing Materials, Paper of different sizes, Colors, Brushes, Pencils, &c., which professional gentlemen and others will find adapted to their requirements, & moderate in price.

ARTISTS' WAREHOUSE AND PHOTOGRAPHIC GALLERY,
22, NASSAU-STREET.

Iron Founders, Plumbers, &c.

BUILDERS' IRONMONGERY, at REDUCED PRICES.
THOMAS HENSHAW AND CO.,
5, CHRIST CHURCH-PLACE,

Beg to call attention to their extensive, varied, and well-selected stock of Ironmongery in all its different branches. It consists of Parlour, Drawingroom, and Bedroom Grates; Kitchen Ranges, Cottage Ranges, Sash Weights; Iron Rim, Mortice, and Stock Locks; Hinges of all descriptions; Wrought and Cut Nails, Eave Gutters, Down Pipes and Fittings, Metal Skylights, Ventilating Bricks; Cast-iron Chimney-pieces, with and without Grates; Rabbit Traps, Fox Traps, Galvanized Wire Netting, Fencing Wire, Sheet and Perforated Zinc, Sink Traps, Furnace Doors and Frames, Hot Air and Plain Stoves. Also on Sale, Saunders' Patent Cooking Range, *the* most economical cooking apparatus of the day.

Manufacturing and General IRONMONGERS and TOOL WAREHOUSE,
81, MIDDLE ABBEY-STREET.
SPADE, SHOVEL, AND TOOL WORKS, CLONSKEAGH.

Agents for Perry's Patent Fire Proof Safes; quality considered, they are *the* cheapest in the market.

BUILDERS are invited to inspect our Stock previous to purchasing.

5, CHRIST CHURCH-PLACE, DUBLIN.

IRON CASTINGS.

THE IRISH ENGINEERING CO. invite attention to the superiority of their Castings in Iron, to the very large number and variety of highly-finished models for every description of work which they possess, whilst the resources of their Foundry (the largest in Ireland) gives them facilities for executing orders with rapidity and economy, thus enabling them to offer advantages to Builders and others not to be obtained elsewhere.

SEVILLE IRON WORKS, SEVILLE PLACE,
DUBLIN.

MILNER'S PATENT FIRE-RESISTING & THIEF-PROOF SAFES and CHESTS.
J. EDMUNDSON AND CO., AGENTS,

PLATE GLASS, of all dimensions, without the delay consequent on waiting for the execution of an order, may be always had at MAURICE BROOKS', SACKVILLE-PLACE.

THE Cheapest House in Dublin for Room Papers, Window Glass, and Laminated Lead for Damp Walls, is J. O'LEARY'S, 1, TEMPLE-LANE, DAME-STREET.

ROOM PAPER, in great variety, at MAURICE BROOKS', SACKVILLE-PLACE, Dublin.

PAPER HANGINGS!!!—A Choice and Varied Assortment of the above, both of English and Home Manufacture, always on view at the Establishment of

JOHN SMITH, BUILDER,
Late contractor to Her Majesty's Board of Ordnance,
Importer of Crown and Sheet Window Glass, Oils,
Colours, Brushes, &c., &c.,
26 & 27 COLERAINE-ST. (near Linen-hall), DUBLIN

GLASS SHADES—Round, Oval, & Square—for Protecting Vases, Clocks, Statuettes, Artificial Flowers, Models, &c. The largest Stock in Ireland for intending purchasers to select from, and sold at manufacturers' tariff. Also a constant supply of Stands for same, polished, French inlaid, or gilt. Wholesale orders executed with despatch.

A liberal allowance to the Trade.

JOHN CARRICK, GLASS AND CEMENT WAREHOUSE,
5, MARY'S-ABBEY.

FIRE BRICKS, of every description and size; Furnace Blocks, Flue Covers, Chimney Cans, Vent Linings, Gas Retorts, Sewerage and Water Pipes, Vases, Fountains; Balustrading; Fire Clay, ground and selected, manufactured at the GARNKIRK WORKS, near Glasgow.

A large Stock always on hand, and for Sale by
WILLIAM D. HENDERSON,
Agent for Belfast.
Fire, Life, and Marine Insurance Office,
42, Waring-street.

Building Materials.

PLANING, SAWING, & MOULDING MILLS,
GREAT BRUNSWICK-STREET, DUBLIN,
(*Adjoining Terminus of Dublin and Wicklow Railway*).
MICHAEL MEADE,

HAVING recently completed the requisite Buildings for the reception of powerful Machinery for Sawing, Planing and Moulding Timber for Building purposes, will be glad to receive orders in this department, and shall execute all favours in the *best*, *cheapest*, and most *expeditious* manner.

M. M. has erected this machinery with a view of keeping the trade in Ireland, large quantities of ready prepared Carpenters' Work being imported from England, and he is prepared to compete with English and Scotch establishments in the execution of all kinds of Carpenters' Work.

TO BUILDERS.

THE IRISH ENGINEERING CO. supply—

WROUGHT and CAST IRON BEAMS; Ornamental Iron Work for Balconies; Cast-iron Sashes.
EAVES, GUTTERS of all kinds.
RIDGE and CREST TILES, &c., &c.
Also, PLUMBERS' CASTINGS and RANGE WORK.
SEVILLE IRON WORKS, SEVILLE-PLACE,
DUBLIN.

SLATES, YORKSHIRE AND CARLOW FLAGS, FLOORING TILES, &c., of the best description, and at lowest possible prices, at THOMAS BRETT'S Brick and Flag Offices, Broadstone, Portobello, and Baggot-street Bridge.

BUILDERS' GOODS, Kitchen Ranges, Ironmongery, Window Glass, Oils, Paints, and Paper Hangings, of the best qualities, at MAURICE BROOKS', SACKVILLE-PLACE, DUBLIN.

TO BUILDERS.

JOHN WRAFTER is always prepared to contract with Builders for the extensive supplying of Lime, Sand, or Granite Stone Dressings on the most moderate terms. Address, ROSENALLIS.

THOMAS TICKELL'S TIMBER & SLATE STORES,
193 & 194, NTH. KING-STREET (Corner Green-st.)

Importer of Fire-blocks, Bricks, Kiln, Oven, Floor, Ridge, and Pan Tiles, Bath Brick, Ridge and Sink Stones, Fire Clay, &c. Country Orders attended to.

TIMBER AND SLATE STORES,
SWIFT'S-ROW, LOWER ORMOND-QUAY
(*Near the Metal Bridge*).

Mahogany, Cedar, Rosewood, Walnut, Birch, American Ash, Pine, Deals, Staves, &c., &c. A large Stock of Staves on hands. Country Orders promptly attended to. GEORGE FINNEGAN.

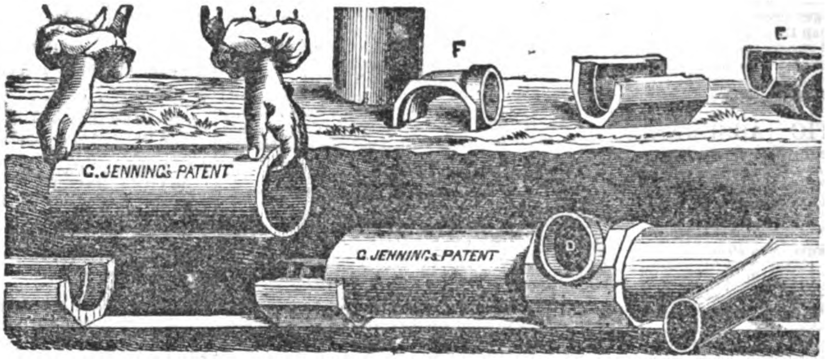
IMPORTANT TO
ARCHITECTS, CIVIL ENGINEERS, PROPRIETORS, BUILDERS, ETC.

JENNING'S PATENT SEWER PIPES.

ROBERT BROWN,
FERGUSLIE FIRE CLAY WORKS, PAISLEY,

Now holds the exclusive right from the Patentee to Manufacture and Sell these Pipes in all Scotland, with the liberty to Sell in Ireland (County of Cork excepted) and in Foreign Countries.

"Mr. George Jenning's Patent Drain Pipes, as we have before taken occasion to say, are certainly the best arrangement that can be used."—*Builder.*



THESE Pipes are the most perfect yet introduced, and are universally acknowledged as the only improvement yet effected on the ordinary Socket or Half-Socket Pipe.

The following are some of the advantages offered by the use of these Pipes:—

1st—The Pipes, which are plain at both ends, are laid in the rebates of the chairs, a sufficient distance apart to admit of the workman striking up the joint of the invert perfectly fair on the inside, thus avoiding the burr of the cement, or other stopping material, being left to impede the flow of sewage and ultimately stopping up the drain.

2nd—The Superintendent of the Works can insure this being effectually done, by personal examination, before allowing the saddle pieces to be put on.

3rd—Facilities for examination, such as no other system of drainage presents or admits of, as, in the event of stoppage, it is only necessary to remove the Upper Saddle at any point, when the cause of the stoppage is at once ascertained and removed, without in any way damaging the drain, the only expense being the labour.

4th—Should Branch Drains be required at any future time, it is only necessary to remove any one of the Plain Saddles, and to substitute for it a Junction Saddle, as at D; which, by turning round, is available for either side of the street.

These Pipes are from 8 to 18 inch bore, and, with all the advantages they possess, are the same price per yard, including the Patent Saddle and Cradle, as charged for the ordinary Socket Pipes.

The usual Socket Pipes also made, and sold as formerly; along with Ornamental Chimney Cans, Vent Linings, Joist Shields, Fire Bricks, &c., &c., and all articles made of fire clay.

Prices and all further particulars furnished on application.

These Patent Pipes, &c., to be had from all Wholesale Merchants, and, when desired, they are forwarded direct from the Works.

William Tite, Esq., M.P.
Treasurer—Thomas Henry Wyatt, Esq.

THE objects of the Association are—To procure and supply to Subscribers Photographs of Architectural Works of all Countries; to form a Collection of such Photographs; and, if desirable, to exhibit them; and in any other manner to render the Art of Photography serviceable to the promotion of the knowledge of Architecture, and to the requirements of the Profession.

An Exhibition of Photographs takes place once in every year, from which Subscribers are entitled to make selections, subject to such conditions as the Committee consider it expedient to make.

Subscriptions are due on the 1st of January in every year.

⁂ Subscribers' names will be at once enrolled on the list of the Association, on application to the Honorary Secretary, Mr. Robert Hesketh, 95, Wimpole-street, W. Subscriptions of not less than a Guinea from each Subscriber may also be paid to him. Post-Office Orders to be payable in Old Cavendish-street, London, W.

Local Honorary Secretary, C. Papworth, 7, Talbot-st.

It is the desire of the

WESTERN LIFE ASSURANCE SOCIETY OF LONDON (Established in 1842), to Lend Sums of from £50 to £500 on Personal Security, collateral with Assurance.

ARTHUR SCRATCHLEY, M.A., F.R.A.S., Sec.

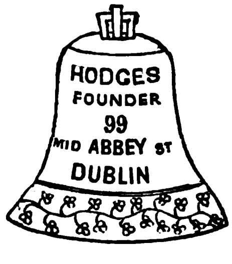
JAMES WILSON RAMSAY, Solicitor, Agent, and Law Agent to the Dublin Trades Protection Society, 16, Bachelor's-walk, Dublin.

TO CORPORATE BODIES, TOWN COMMISSIONERS, AND THE PUBLIC.

RICHARD DOMIGAN, *Bass Broom, Cocoa Fibre, Mats and Matting, Straw Palliasse, Oilcloth, Sheet and Pipe Lead, and Curled Hair Manufacturer*, No. 72, MOUNTJOY-ST., Dublin.

⁂ Large Orders executed on moderate terms.

London and Paris Great Exhibitions



Prize Medal Bells.

MINTON and CO.'S ENCAUSTIC and other PATENT TILES, for Churches, Entrance Halls, Conservatories, Balconies, &c.; Antique, Geometrical, and Alhambric Mosaics, manufactures of highly decorative character, and extreme durability, Slabs, and Tiles for Fire-places and Hearths, Coverings for Grates, Door Furniture, White Glazed and Ornamental Tiles for Baths, Dairies, and Kitchen Ranges, may be had in great variety at their Manufactory, Stoke-upon-Trent, Staffordshire.—Designs prepared and estimates given on application to A. J. ALDRICH, AGENT, 12, TALBOT-PLACE, DUBLIN.

VALUABLE BOOKS, relating to ARCHITECTURE, BUILDING, and CIVIL ENGINEERING, on SALE, at greatly Reduced Prices, at BRADLEY BATSFORD'S, 52, High Holborn, London, W.C.

Architectural and Scientific Books bought or exchanged. Catalogues sent Post free.

NOTICE OF REMOVAL.

ROBERT MANNIX, House Painter, has removed from Lower Mount-street to
14, MERRION-ROW.

NOTICE OF REMOVAL.

JOHN QUIN, Builder, respectfully informs his friends and the public that he has removed from 136, Lower Gloucester-street to the more central and extensive Concerns, 63, Upper Stephen-street, where, in addition to, he has made arrangements for carrying on a trade in Timber, Deals, Laths, Slates, Fire Bricks, Fire Clay, and Ridge Tiles, Chimney-tops, Plain and Fancy Tops, Sink Stones, Sewer Pipes, and every article for the Building Trade.

TO ARCHITECTS, BUILDERS, CABINETMAKERS, AND GILDERS.

HENRY E. JAQUES (late of London), Wood Carver in all its branches, begs to inform the above that he has commenced business in 36, Middle Gardiner-street, and by attention to business, punctuality, moderate charges, and a thorough knowledge of all the above branches of the Carving, he hopes to gain their patronage.

36, MIDDLE GARDINER-STREET.

The Dublin Builder.

VOL. I.—No. 4.

SANITARY CONSIDERATIONS.

SEWERAGE—NO. II.

IN order to arrive at just conclusions, we must *begin* at the *beginning;* and it would have been a happy circumstance, perhaps, that the origin of the existing evil of the sewers had been examined into long since.

The sewers of the present day are, in their general design, what they were ages since—constructed then, and long within our own time, simply to carry off the surface-water of the streets and the culinary and other such waters of residences. The laws strictly forbade that animal matter or filth of any kind should be cast into them, and at the present moment the penalty leviable *in Dublin,* as well as elsewhere, by common information before a magistrate, is £5 for every breach of as wise an enactment as ever did honour to our forefathers. It is forbidden, in the most stringent terms, that rivers, streams, or water-courses shall be polluted in any manner; and every resident upon a river side who can prove the pollution of the stream by an individual above him, can recover damages for the act in proportion to the injury done. It is, in fact, an established and recognized principle of law, that the pure waters given by Providence for the use of mankind shall not be made impure by man.

To uphold this principle, then, as it should be, it was most properly made penal if filth were discharged into *public sewers* communicating with streams or rivers; and as it was never intended that such sewers were to do more than carry off the waters already described, their design was well suited for the object, but totally unsuited for the use which, unhappily, has been recently made of them—namely, receptacles for human excrement.

No doubt the hope of him who first broke the law, and surreptitiously introduced into a public sewer the pipe from a water-closet, was, that the matter would be carried off by the water of the sewer; no doubt, too, he succeeded so far in his wishes as to accomplish the object of getting rid of his own filth; and where it went to he evidently cared but little. But, by degrees, when others followed the "original sin"—for less it certainly was not—the evil began to show itself, and the monstrously selfish and unjustifiable act of sending forth from our houses the elements of disease to disseminate noxiousness and poison, produced its own punishment: *disease came back upon its propagators.* London, the parent of the water-closet and present sewerage system, has become the greatest sufferer by this outrage upon both principle and science; and it is likely to pay the penalty more deeply still, for in its self-sufficiency and pride, it still goes step by step deeper into the wrong.

We have shown that *legally* there is no justification for the present sewerage system, now let us examine it professionally.

The matter which is so improperly introduced into the existing sewers—night-soil or human excrement—is composed of about 75 per cent. of watery substance, with some 25 of solids, containing ammoniacal and other phosphates, lime, urea, mucus, and other animal matters. It is peculiarly slimy and sticky, adheres pertinaciously to every place it touches, and requires, in fact, to be rubbed or scraped away even from glazed surfaces, such as closet-pans specially prepared to prevent its adhesion.

The effect of this peculiarity is, that throughout every part of the space which it passes in a sewer, and touches either bottom or sides, it leaves a portion of itself—coating by degrees the whole, and forming a mass of putrifying matter, daily fed by new supplies, until at length the sewer chokes, and the exit of the water is stopped. Hence the need for the disgusting operations which we witness daily, in sewers being broken into from the streets, and the accumulations of filth bucketed up at noon day, as well as night, whilst streams of noxiousness rush from beneath.

The most careful examination of the sewers of London has incontrovertibly established the fact, that by *scraping, brushing,* and *bucketing alone* can these accumulations be removed. It is no theoretical conclusion arising from the nature of the thing that causes the evil—it is the veritable reality, proved by every sewer into which night-soil is discharged, not alone in London, but in every town throughout the kingdom. Where the natural fall of the sewer is least, of course the evil is greatest; but even where it is *most,* adhesion of the matter takes place. The examination of a *vertical* pipe of a water-closet affords the proof. Even there the matter adheres, and after some time the interior will be found entirely coated over; constantly yielding impurity to the atmosphere. Let it not be supposed either, that the water in the pan prevents the escape into the closet. It is no such thing. The gases rush up as the valve is opened to permit the water down; and a careful examination of the phenomenon will prove that the gases are at times forced between the seats of the valve, and up through the water whilst in a quiescent state. They may be seen bubbling up, especially at night, when the closed doors and windows of the house raise the temperature within, and aid the pressure of the gas from without.

That the nature of the matter discharged into the sewers is such as described, cannot be denied; and that it cannot be removed by the mere action of water, is incontestibly established. "Flushing" has no more effect upon the deposit of night-soil in a sewer than water upon a duck's back; it slips over, and runs from one as it does the other. It was, in fact, about as fallacious a proposition as ever came from authority; and coming originally from the quarter it did, was well calculated to mislead, and did mislead till engineering "fashion"—for engineers have fashions, as well as milliners—pronounced it to be the cure for all existing sewerage evils. A greater mistake, unhappily, has rarely been made, and perhaps nothing could more clearly prove the utter want of knowledge of the nature of the article to be dealt with, nor the necessity for engineers, as well as all others, beginning *at* the beginning when they wish to arrive at a successful ending.

Had the nature of night-soil been fully understood, no one, of even moderate comprehension, would have attempted to *get rid of it* by passing it into a sewer, where, of necessity, it is mainly deposited. If it were known that water had no effect in removing it, once its slimy coat had formed, who would have proposed flushing? And surely it is contrary to all reason to imagine that if such facts were understood, so many millions would be thrown away in the construction of *new sewers,* to become nothing more than cesspools after they had fulfilled their mission of carrying through them a sufficient portion of filth to destroy the river or stream into which, by breach of the laws of the country, they are allowed to discharge their noxiousness.

But the evil has been done; the question for consideration is, how can it be undone, now that we know what we have to deal with. London may exhibit her pertinacity and wilfulness in the wrong; she can, perhaps, afford to gratify her vanity by expending millions for the benefit of engineers and contractors, and continue her sewerage system till it *chokes* itself; but Dublin and Ireland cannot afford to be so foolish, nor, as we hope, will Irish intelligence and talent still submit to be hoodwinked and led blindfold in the wake of incapacity.

Antiquities.

CHRIST CHURCH CATHEDRAL.

Christ Church Cathedral is said to have been founded by the Danes, in the year 1038. Sitricus, king of Dublin, bestowed the ground; and Donat, first bishop of Dublin, in conjunction with the abovenamed prince, is generally considered the founder. Probably like most of the clergy of that age, he might have been the architect also; for whatever knowledge of art or science our forefathers possessed, was generally found in the cloister; and pre-eminence in knowledge of any kind—particularly architectural knowledge—was sure to distinguish the possessor, and raise him to the highest elevation in the church. Donat, therefore, we may presume, was the designer of this pile. Be that as it may, Sitricus gave to the blessed Trinity, and to the bishop, the ground on which it was built, and also endowed it with the lands, manors, villains, cows, and corn of Beal Duleek, now Baldoyle; Reehan, now Raheny; and Portrahan. But his munificence did not stop here, for he also bestowed as much gold and silver as built the church and the court thereof.

The original structure appears to have been in the Saxon style (?), notwithstanding its Danish origin. The transepts still retain much of their original state, and exhibit some beautiful specimens of the zig-zag ornament. It is not however pure Saxon, for the pointed arch is intimately combined with it, not only in the windows of the transepts, but also in two or three opens, richly ornamented with chevron mouldings, which are still apparent in the lateral aisles that lead to the choir. This circumstance seems to confirm the supposition, that the pointed arch was in use much earlier than some antiquarians admit.

An arch in the north aisle of the choir, leading to St. Mary's chapel, appears to have given way—probably occasioned by the shock the whole building must have sustained when the roof and south wall of the nave fell, in the year 1562. The arched window over it has also suffered, for the central pillar is displaced, and has lost its perpendicularity. To prevent the arch at the entrance of this aisle from falling in, the space has been filled up with solid masonry, leaving a smaller arched entrance beneath it. Over this smaller arch a square tablet was introduced, with the armorial bearings, supporters, motto and cypher of Sir Henry Sidney, K.G., Lord Deputy of Ireland in the year inscribed on the tablet, 1577. This date ascertains the exact time when this arch was thus repaired.

The exterior of the north transept wall is enriched by a Saxon arched gateway or door, highly ornamented by a complex projecting zig-zag, and various other mouldings. The caps of the shafts which support the arch are formed, as far as their decayed state enables us to judge, of numerous figures of angels, fantastically entwined. At each side of the door was a niche for holding the stoup in which the holy water was contained. This doorway has long since been built up, but the mark of it is still very visible on the interior wall.

At intersection of nave and transepts, and nearly in the centre of the church, a large square tower steeple is erected on four immense stone piers; connected together by lofty pointed arches, which reached the original ceiling of the nave, when it was in existence. The present groined ceilings of the transepts appear to be modern. The north side of the nave consists of six lofty and extensive pointed arches of beautiful workmanship; and the piers which support them are richly decorated with eight clustering columns or pilasters. Some of these columns are banded in two divisions, and others are quite plain from the base to the capital. There is a sharpness and spirit in the foliage that terminates some of the columns, which is admirable. The canopies over these arches are supported by corbel heads of grotesque expression, and well sculptured. The triforium, or friars' walk, looks into the great aisle below, from a row of arched niches of three compartments each. Above these recesses is a range of clerestory windows, consisting of three distinct lancet-pointed arches, very narrow, the central arch being considerably higher than those at each side. There are six of these treble windows corresponding with the arches, over which they are ranged; and together with the blind windows or niches, connected with the friars' walks immediately under them, are enclosed in a large arch, nearly equal in size to the lower arch which springs out of the piers, and affords them support. The south wall is a plain, ornamented, heavy structure, remarkable only for the expedition used in rebuilding it, which is upon record; for we are informed by a laconic inscription on the wall, curious for the quaintness of its style and orthography, that "This wal fel down in an. 1562. The bilding of this wal was in an. 1562." The plainness of the wall is, however, in some measure counteracted and relieved by the monuments to which it gives support.

The upper part of this wall exhibits a few inscriptions; besides that already mentioned, another sets forth that the monument of Strongbow, Earl of Chepstow, being broken by the fall of the roof, it was repaired, and soforth. But doubts have been entertained as to the identity of this monument; for some assert that the present monument is the effigy of Thomas, Earl of Desmond, who was beheaded in Drogheda, anno 1464; and that it was removed thence to this abbey. A more positive objection to its identity is derived from the armorial bearings with which the shield of the recumbent knight is charged, which are Argent, on a chief, three cross crosleta fitched. This Earl of Desmond was a branch of the Geraldines, and it is asserted that no member of that extended line ever adopted the arms described on it. It would appear that the ancient monument being broken, the architect and masons in Queen Elizabeth's time, who repaired the building, not being very scrupulous antiquarians, dexterously substituted some unclaimed piece of rude antiquity, such as the sculpture now under consideration, to represent this memorable and enterprising hero. "Nosce te ipsum" is another pithy motto depicted on a label inserted in the wall, adjoining a tablet charged with the letters W. H. MASO, meaning probably the device of the mason who built the wall. This was an age in which learning did not disdain an association with the *masonic* art. Ben Johnson was a learned mason or bricklayer, and why not allow any other mason to display a little learning also? This, however, after all, is but conjecture.

The great western window, and the wall in which it is inserted, appear to have been built at the same time with the wall on the south side of the nave. It is probable that as they adjoined each other, they both suffered the same calamity which overtook the latter.

Large windows were at this period (1562) the prevailing fashion, and had entirely supplanted the elder fashion of narrow pointed or lancet arch windows, still to be seen in the original parts of the building. This window is a circular arch, much more lofty than the original groined roof appears to have been when it existed. There are several monuments in the south side of nave of more recent date than those described. The chief are—a mural monument to the late General Achmuty, G.C.B., in white marble, by T. Kirk, R.H.A., 1822; to Thomas Prior, Esq., the founder of the Royal Dublin Society, with an inscription by Bishop Berkley; sculptured by Van Nost, 1756; to Lord Chancellor Bowes, also by Van Nost, 1767; to Lord Chancellor Lifford, 1789; the ancient monument of Strongbow, already mentioned; and the monument of Dr. Ellis, Bishop of Meath, and his lady. There is also an excellent piece of sculpture, by H. Cheere, to the Earl of Kildare, ancestor to the present Duke of Leinster, situated in the chancel of the choir; and these comprise all the monuments of any interest in the cathedral.

The northern side of nave—whether by the shock it sustained when the opposite side and the roof fell, or through natural decay, or from the sinking of the earth on which its foundations are built—leans a considerable degree out of a perpendicular line. Some few years ago a very strong abutment was built, inclining against the wall of its lateral aisle; and perhaps by this means the church may be upheld for another century.

The soil on which it is founded is a turbaceous mould, black and soft; and appears to be common turf bog, in a state of progressive decomposition. When the builders of the houses on St. Michael's-hill, Winetavern-street, were digging foundations, this appearance was very palpable, and accounts for any deviation from the centre, in this extensive and ancient pile, which the unstable soil still sustains.

The choir was said to have been built, in 1170, by Laurence O'Toole, Archbishop of Dublin, Earl Strongbow, Robert Fitzstephen, and Raymond le Gros; together with a number of chapels, the situation of which are now no longer traceable. The present chapel dedicated to St. Mary, was not erected until 1512, by Gerald, Earl of Kildare.

The great eastern window is circularly arched, and seems to have been erected about the same period when that of the nave was rebuilt. The side windows of the choir are formed of pointed arches, of a dimension considerably larger than the clerestory windows in the nave. They are irregular in point of size compared with each other, and apparently were built two or three centuries later than the former, though, from their external appearance, they are evidently in a very inferior style of workmanship.

According to an inquisition (says Ware) held by Richard II., anno 1383, this church was stated to have been founded and endowed by Irishmen unknown, long before the Conquest. John Le St. Paul, Archbishop of Dublin, built, at his own charge, the chancel; and certainly the interior of the choir has undergone so many alterations in the last two centuries, that there are little traces of the original Gothic character left. It presents, like most buildings erected during this period, a confused jumble of styles, purporting to be imitations of regular classic architecture, but in reality an incongruous mixture of both, with little pretensions to the taste and correctness of either the Gothic or the Grecian style.

The external appearance of the building is heavy and uninteresting. The only beautiful parts about it are the Saxon door, and windows of the transepts before described, and the Gothic shafts which supported the external arches of the clerestory windows.

Christ Church, in its original monastic state, was styled the Priory of the blessed Trinity, and in the church itself, and the abbey, several parliaments have been held. The black book of Christ Church is still classed among our most ancient and authentic national records.

Among the founders and restorers of this church, beside John de St. Paul, Archbishop of Dublin, and Gerald, Earl of Kildare, we should not omit the Earl of Sussex, who rebuilt part of the nave, in 1562; Sir Henry Sydney and Archbishop Jones, who (according to Ware) repaired a great part of the church and steeple, which had fallen or otherwise gone to decay.

The following are the general dimensions of this ancient pile:—

	Ft.	In.
Length of nave from west wall to door of choir	126	0
Breadth of nave, including centre and one side aisle	43	6
Breadth of the back aisle	13	4
Length of transepts from north to south	88	6
Breadth of ditto	25	0
Length of choir, about	108	0
External length of St. Mary's chapel	66	0
Total external length of the church, including St. Mary's chapel and the buttresses	246	0

THE GENOESE PRISON COMPETITION.

THE Sardinian Government having purchased the design furnished, in the recent competition, by an Irish architect—Mr. John Philpot Jones—practising in London, we feel pleasure in noticing its principal features.

In the centre of the east front is the entrance, with strong double doors—the outer one flanked by circular turrets, and loopholed for defence. This entrance gate has a platform on the top, which may be made available for mounting small guns, if at any time required. Opposite the gate are the main buildings of the prison department. Passing through a large hall, there are on each side offices for porters, register and receiving rooms, bath rooms, and cloth store.

The female prisoners have separate and similar accommodation. In this portion of the establishment are rooms set apart for the commissioners of charity and committee of surveillance, and for the judges, advocates, sisters of charity, and *corps de garde*, &c. On the second floor are the living rooms and bed-rooms for the warders, should they be required to live in the establishment. These buildings form a cortile, in the centre of which is the director's house, connected by a corridor with the central octagon hall of the prison, from which run the main galleries, with cells for the male prisoners.

The women's gallery, and another for the males, are connected with the director's house by side corridors. Instead of grouping all the men together, one portion of them—equal to 100 cells—are at the left-hand side of the director's house. These cells are devoted to younger prisoners. The women occupy a similar ward on the right of the director's house.

The director or governor has complete supervision over all the galleries, yet each class of prisoners is quite separate from one another. A certain number of cells is appropriated for prisoners *in transitur* and prisoners "*ditenuti di passagio*," distinct from the rest of the prisoners, but under the control and supervision of the director. A separate gallery is set apart for punishment cells. "*Camere di societa*," "*camere di lavoro*," are given to prisoners of a better class, if it may be thought desirable to allow prisoners to associate together. This is strongly recommended by the author.

At the end of the women's gallery is placed the women's infirmary, with all appliances to make it complete. The male prisoners' infirmary is connected by a corridor from the right-hand wing of the male prisoners' gallery. It is arranged so that it may be either an associated ward, or, if desired, it may be divided by screens attached to the piers which support the vaulting. The whole of the cells throughout are arched with brick. The washing department is adjoining the women's gallery, and is fitted up with the most approved machinery for washing and drying clothes. In the exercising yards each prisoner can take exercise for one hour in the day, under the supervision of the warders. The wards are all connected by means of iron galleries, 1·25 metres wide, which afford perfect access and supervision to the director and his officials, as well as for the sentinels. Each cell is fitted up with a table and stool fixed to the floor, a book-shelf, and a bed hung as a hammock, which can be folded up and put away during the day. A water-closet and wash-stand, with a water-pipe attached to each, and gas, are also provided; likewise a bell, which is rung when the prisoner wishes to call the warder. The windows are at a high level, and secured by double gratings. The doors of the cells are of solid wood, with an iron-railed door also.

The ventilation has much engaged the author's attention, and the following is the mode which seems the best that can be adopted for a prison:—Flues are to be constructed in the walls of the cells leading into a main foul-air channel in the roof, which is connected with a rarifying flue, so that all the foul air is drawn out of the cells into the main shaft, to be rarified by gas-lights kept constantly lighted, over openings from the gallery into the cells, over the doors for regulating the temperature; these openings are grated. A flue also is constructed from the external wall, with strong gratings and a slide, to regulate the temperature in summer. As it is proposed to light the cells with gas, a shade is fixed over the lamp, with a pipe connected with one of the flues, to increase the ventilation by rarification. Great care has been taken in the construction and arrangement of the plan, so as to prevent the possibility of sound being conveyed by the human voice. This is accomplished by means of earthenware paraboloids, built in the flues, so that whatever sound may be attempted to be conveyed through the ventilating flues from cell to cell, it would rebound, &c. It is proposed to warm the several galleries by a principle of hot air carried in flues throughout the entire building.

The building is to be constructed of stone. All cells arched, and filled up in the spandril with concrete, on which will be tile flooring on the Italian principle. The whole of the prison to be supplied with water pumped by the prisoners. The author's designs for two prisons at Turin are on the same principle, though a different arrangement of plan.

SKETCH OF LIVERPOOL — HISTORICAL, COMMERCIAL, AND ARTISTIC.

LIVERPOOL, now one of the greatest commercial emporiums of the world, is a town of comparatively modern origin. The first authentic, official mention of it is found in a charter granted in 1173, during the reign of King Henry II. It has been supposed that the King in giving this charter, and allowing perfect freedom of navigation to the inhabitants of Liverpool, had in view the conquest of Ireland. A charter regularly incorporating the town of Liverpool was granted by King John in the year 1207. It was not however until the reign of Charles II. that Liverpool became a place of any importance whatever. The emigration to the new British colonies in America commenced at that time, and opened a new market for the manufactures of the north-western counties of England.

The Liverpool merchants entered very largely into the slave trade, and a century ago more than one hundred of them were openly engaged in it. Their ships, after conveying their cargoes from Africa to America, returned to Liverpool laden with tobacco and sugar. Great as was the interest of Liverpool in the slave-trade, that of London and Bristol was even greater.

The wars which took place in the eighteenth century against France and the United States interfered seriously with the commerce of Liverpool. Sir Richard Arkwright's inventions, however, built up a strong manufacturing interest in Lancashire, and on the restoration of peace a large cotton trade grew up between the United States and Liverpool. The growth of the city within the present century has been immense. In 1801 its population was about 77,000; at present it is more than 400,000. The commerce of Liverpool connects the city with every quarter of the globe. She has a large East and West Indian, and South American trade; and since the settlement of Australia, she has monopolized a large portion of the trade of that remote and flourishing colony. Her Australian packet-ships have a world-wide celebrity. A large number of fine screw-steamers maintain a constant communication between Liverpool and the ports of the Mediterranean and the Levant. and the communication between Liverpool and the United States by packets and steamships is more frequent than between any other places so distant in the world.

Some idea of the extent of the commerce of Liverpool may be obtained from the consideration of the fact, that in the year 1856 nearly 21,000 vessels, averaging more than 200 tons burthen, entered its port. The trade of Liverpool consists mainly of the great staple articles, such as grain, wool, cotton, sugar, tobacco, &c. In the year 1856 the imports of cotton into Liverpool considerably surpassed 2,000,000 of bales, a large part of which was from the United States. The grain trade between the United States and Liverpool is next in importance to that in cotton. The importations of sugar amounted in 1856 to some 76,000 tons—coming in pretty equal proportions from the West Indies, Brazil, and the East Indies.

Liverpool is finely situated for a great commercial mart. It reaches for some six miles along the banks of the Mersey, and has room to grow to almost any reasonable extent. Its harbour is somewhat exposed to the north-west winds, but it is in contemplation to build a magnificent breakwater which will entirely obviate this trouble, and greatly improve the maritime advantages of the city. The rise and fall of the tides at Liverpool is so considerable as to require the erection of docks. The docks of Liverpool are the most striking feature, and are built of smoothly dressed granite, and extend along the whole front of the city. The river wall of the docks is more than five miles in length. The docks enclose a water space of 200 acres, and, including the yards and warehouses, occupy an area of more than 700 acres. The quays which surround the docks measure more than fourteen miles in length. Two immense landing-stages, which rise and fall with the tide, are placed in front of the line of docks, to facilitate landing and embarkation. The docks of Liverpool are surpassed by nothing in the world as a triumph of mechanical skill. The city is well built. St. George's Hall and some of the banking-houses, are fine specimens of architecture. The Philharmonic Hall is one of the best music-halls in Great Britain.

IRISH SULPHUR MINES.

This important branch of our national industry is attracting much attention. Our manufacturers of sulphuric acid prefer the Wicklow ores to any other pyrites they can procure. No sulphur ore yet introduced into the market finds such favour as the Irish. Wicklow has been hitherto the grand source of supply; even this vast storehouse can scarcely equal the demand. Notwithstanding several new works are about to be undertaken, ample outlet for all that can be raised will be found; indeed, new sources of consumption will be developed in Ireland herself, as her agricultural prosperity advances. Already are large works established for these pursuits with considerable success; these are sure to be followed by others, for rivalry and competition are as rife in the Sister Island as in this—the evident prosperity of any one branch is sure to evoke this latent principle of mankind. We expect ere long to see many works for the formation of vitriol in the principal cities of Ireland, solely for the purpose of creating these important aids to her natural fertility. The principal one is to be obtained at such a cheap rate as to defy competition by the foreigner for common purposes, whilst the supply is perfectly inexhaustible, limited only by time for extraction and capital for establishing the works. The traffic thus engendered will be a source of immense employment for her mercantile marine; and the emoluments derivable from the labour in its procuration and manufacture must be very considerable. We sincerely hope that the knowledge of the sums realised by some English landlords will not excite a suicidal cupidity on behalf of their Irish brethren, such as, we regret to say, has been the case in some Welsh instances; for they may depend upon it the Hibernian capitalists, like the Cambrian, will discover the error, and regret, when too late, the want of patronage and withdrawal of capital that would otherwise have been expended in prosecuting mining adventures on their properties. Nor in the endeavour to raise sulphur ores is this, though the grand source of enterprise, the only one from which important results may follow. Sulphur is well known to be the associate of many other more valuable minerals; it is almost always found with copper, in the mines of which sulphur is looked upon as a favourable indication, as well as in the mines of lead, zinc, &c. We, therefore, hail the advent of a great period of Irish mining industry now beginning to display itself, as shown in our journal of last week. We commend these remarks and cautions to the proprietors of the Currawn estates, in Mayo, assuring them our advice is given with the utmost sincerity, and only with a strong desire to foster and cherish the industry of our neighbours, who are evidently bestirring themselves, and becoming daily more alive to the real value of the splendid resources Nature has so bountifully bestowed on Erin's green isle. —*Abridged from the Mining Journal.*

The English Catholics are about building a church of their own at Rome. The work is entrusted to an eminent London architect, and a collection has already been set on foot to carry out this undertaking.

MEMOIR OF THE LATE JOHN HOGAN.

John Hogan, the celebrated Irish sculptor, was born at Tallow, in the year 1800, and was the son of a builder. He was descended paternally from the old Dalcassian tribe of the O'Hogans, and maternally from Chief Justice Sir Richard Cox, afterwards Lord Chancellor in the reign of Queen Anne. He was placed with an attorney in Cork, named Michael Footte, in 1812, but. like Chantrey, his propensity for the fine arts, and not law, quickly manifested itself. At fourteen years of age he was placed with Mr. (now Sir Thomas) Deane, with a view of his becoming an architect; but the turn of his mind was evidently for sculpture. His first essay was the statue of Minerva, over the insurance office on the South Mall, Cork. He prosecuted his studies in Cork until 1823, when, through the aid and energy of Mr. William Paulett Carey, who foresaw in the young artist the future genius, a handsome subscription was formed, which enabled him to set out for Italy. The subject of his first work, undertaken professionally, was "Eve after her expulsion from Paradise picking up a dead bird," and is stated to be exquisite. His statue of "The Drunken Faun" (pronounced by Thorwalsden a miracle of art) was undertaken in defiance of a taunt by Gibson, that Hogan, nor any other sculptor, could not produce an attitude or expression in the human figure not already appropriated. Hogan was pressed for want of funds in 1825, but was relieved by his old friends Lord de Tabley and Mr. Carey. The "Dead Christ," in Clarendon-street chapel, was his next great work, and he received £450 for it. Since that period he has executed figures of "Religion," the "Pieta," several busts and basso-relievos; but the monuments to Dr. Doyle, Drummond, Crawford, O'Connell, Lord Cloncurry, &c., are among his chief works. Of the former, the subject is a Christian prelate offering up a last appeal to heaven for the regeneration of his country, which is personified by a beautiful female (Erin) in an attitude of dejection at his side. She rests on one knee, her body bent and humbled, yet retaining beauty and dignity of character; her turret-crowned head resting on one arm. while the other, with an expression of melancholy abandonment, reclines on and sustains her ancient harp. This monument stands in the parish R. C. Church of Carlow. Mr. Hogan was engaged on several important works at the time of his death, amongst which we may mention one of the bas-reliefs for the Wellington Testimonial, Phœnix Park. His design for the Moore Statue was universally admired by the public, though rejected by the committee, with what wisdom and justice subsequent events have shown, to our perpetual national disgrace; and such rejection not a little preyed on the mind of a sinking spirit, worn out by struggles against untoward fortune.

OPENING OF THE LURGAN MECHANICS' INSTITUTE.

This new building, erected from designs by Mr. Raffles Brown, architect, has been opened, and is situated in the Main-street, almost directly opposite the principal entrance to the Brownlow House demesne. The style is the early Grecian, and the effect of the exterior is greatly increased by a handsome clock tower. There are two entrances—the principal one from the High-street, and the other from Union-street, to each of which streets the building has a front. To the right of the entrance hall is the newsroom and library, which at present contains about 1,200 volumes, as the nucleus of one intended to be far more extensive. The books have been selected from their adaptation to the requirements of the working classes. The lecture-room, on the same floor, is a spacious semicircular apartment, lighted from the roof through stained glass, and capable of accommodating a large audience. Committee and retiring rooms occupy the remainder of the lower storey. On the second floor are situated the male and femals schools. A night school, largely attended by the adult working population, has been commenced, and promises well. There is also an apartment which it is intended to use as a museum for the exhibition of specimens of those wondrous fabrics of cambric and damask with which the name of Lurgan is associated over the whole world. The tower will contain instruments for keeping a complete meteorological register.

MORTALITY IN IRELAND—STATISTICAL DEFICIENCY.

Hitherto, owing to the want of a proper registry of deaths, the public have been kept completely in the dark regarding the comparative mortality of the different towns and districts in Ireland. The importance of this information cannot well be appreciated except by those who have made sanitary matters a subject of close investigation. It is, therefore, with much pleasure we learn that Lord Naas has introduced a bill for the registry of births, deaths, and marriages, which we hope to see passed into law. Boards of health in England are able to show the actual diminution of mortality arising from sanitary improvements introduced by them; and *we* will also be able to judge, as soon as the registrar-general has made his return, the places in this country where sanitary improvements are most needed.

INSTITUTION OF CIVIL ENGINEERS OF IRELAND.

An evening meeting of this institution was held on the 8th ult. at their rooms, 41, Upper Sackville-street. After the usual transaction of business, Mr. Bindon B. Stoney, assistant engineer to the Ballast Office, read a paper on the Newcastle Coal Experiments, made for the purpose of deciding to whom should be awarded the £500 prize which had been offered by the Steam Collieries Association of Newcastle-upon-Tyne, for the best method of preventing the emission of smoke from multitubular boilers. Mr. Stoney described his method of smoke prevention, which, with three others, was selected for trial out of 103 competing plans, and proceeded to institute a comparison between it and the plan published by the judges as their own. A discussion ensued, in which the president, Mr. M. B. Mullins; the secretary, Mr. Alexander Tate; and Messrs. Anderson and Hill took part. In the course of the remarks made by Mr. Anderson, testimony, from his own experience, was borne to the entire success attained by the use of the plan proposed by Mr. Stoney.

RESTORATION OF THE BLACK ABBEY, KILKENNY.

We learn that the ancient Church of the Priory of the Holy Trinity, at Kilkenny, commonly called the "Black Abbey," is to be restored, if not fully, at least so as to preserve the principal features, under the superintendence of Mr. J. J. M'Carthy, architect, A.R.H.A., a gentleman whose experience in Gothic architecture pre-eminently qualifies him for the task. The "Black Abbey" was founded in the 13th century, and must have ranked, perhaps, as the very first monastic church in the kingdom for size, while for beauty it was probably exceeded by none, and for uniqueness of plan stood alone and unrivalled. The ground plan comprehended a nave, of rather short dimensions, with an aisle on the south, opening into the nave, of three Gothic pointed arches, rising from rounded columns; a very long choir or chancel for the religious of the community; a south transept, also long and proportionately wide, opening by five pointed arches into the west aisle. At the junction of the nave, choir, and transepts rose, and still rises, a lofty, square bell tower; and at the west end of the nave stood a massive, fortress-like tower, now partly ruinous. On the north side of the church stood the cloisters and conventual buildings, traces of which may yet be seen. The ancient choir has altogether disappeared, so has the aisle of nave, but the foundations of the latter have recently been laid bare. The roof is gone from the nave, and the only parts now in anything like habitable preservation are—the south transept and its aisle, which are used as the present conventual church. They are, even in their present forlorn condition, extremely beautiful. Nearly the entire of the south gable is filled with a magnificent traceried window of five lights, of the period of the 14th century. The east side of the transept has a series of three-light traceried windows of about half a century later than the south window. The transept communicates with its aisle by pointed arches, supported on pillars with capitals, moulded in the style of the 13th century.

INSUFFICIENCY OF BRIDGE ACCOMMODATION IN BELFAST.

Belfast, like other thriving towns, seems to be outgrowing its bridge accommodation. Complaints are numerous that the Queen's bridge, not yet 20 years built, is already too narrow for the traffic, and a project is talked of for increasing its width, by adding laterally metal footpaths outside the present structure.[*] One seems at a loss to account for the want of foresight displayed by the parties concerned in its erection; for a glance at the records of the past would have shown them that the town had doubled its population in less than 20 years prior to the bridge being built, and was steadily and rapidly increasing, thereby making it incumbent on both the designers and projectors to anticipate proportionally the requirements *in futuro*.

One very obvious means of relief would be, for the two counties to purchase the Lagan bridge, and abolish the toll, thereby diverting the current of traffic into two smaller streams. We think that the landlords of Ballymacarrett have not consulted their own interests, or the toll on this bridge would have been done away with many years ago. The whole of the townland, which contains upwards of 500 acres, was mapped and laid out in streets at the instance of the principal proprietor some five or six years since, and there is no doubt but that the abolition of the toll on the Lagan bridge would greatly conduce to the letting of the building ground. It is questionable, however, should the borough of Belfast join the two counties in purchasing this bridge? Belfast pays a large share of the county assessments, and certainly ought not to be doubly taxed for this purpose, when it is the business of the counties, as a whole, to provide for the passage of their respective inhabitants to and fro, by giving them sufficient bridge accommodation.

---

[*] It is rather a curious coincidence that a *similar* project, respecting a *similar* structure, and *similarly* situated, should be on the *tapis* simultaneously both in Dublin and Belfast.—Ed.

FRESH AIR, AND PLENTY OF IT!

An important discussion on the most effectual modes of ventilation took place at an evening meeting of the Royal Dublin Society, held on the 25th ult., and various interesting and valuable facts and opinions were brought forward.

Dr. Edward Haughton read an excellent paper on "The Theory and Practice of Ventilation;" and the principle of a new "patent ventilator," recently invented by Mr. M'Kinnell, of Glasgow, and now in full operation at Ship-street Barracks, House H, Nos. 3 and 8, were introduced by Dr. Barton, and dilated upon by him and several other gentlemen. Mr. Ferguson, architect, explained, by diagrams, a mode he had adopted of "*heating*" the atmosphere of apartments by means of a flue, of zig-zag form, passing over and under the boiler of the kitchen fireplace, and thence vertically in the chimney-shaft to the top, with outlets in the chimney breast, conveying heated air—supplied fresh from without—to the various storeys; but the principle is a mere adaptation of that ordinarily in vogue, and the explanation was involved in much abstruseness, until Dr. Gray, with his usual tact and ability, showed the "heating apparatus" had no connection with the ventilation, and that, for the latter purpose, a *second* agency had to be employed. and in a directly opposite direction—a complication which it would appear desirable to avoid.

Dr. Haughton's paper shall be published *in extenso* in the May number of "The Dublin Builder," as also shall an explanation of Mr. M'Kinnell's apparatus, with an illustrative woodcut.

NEW PATENT BALANCE ROLLING BRIDGE.

The inconvenience of the ordinary swivel-bridges at dock entrances has led Messrs. Turner and Gibson, of Hammersmith Iron Works, in this city, to devote their attention to the remedying of the objections complained of, and these gentlemen have recently patented an invention simpler in construction, less liable to get out of order, and presenting less impediment to the public traffic than those structures now in use. The principal features of the design are, that the motion is longitudinal, the bridge being lifted *in toto* out of its berth, balanced and travelling on two rollers, and raised, opened, and shut by two others. The massive and expensive stonework of swivel-bridges is dispensed with, as the ordinary roadway receives the bridge in its longitudinal course of motion; and the gearing is of a less complicated character. A working model may be seen at Hammersmith Iron Works and Oxmantown Foundry.

RESIDENCES FOR WESLEYAN PREACHERS.

The Wesleyan body, like the Presbyterian, are for organizing and carrying out the erection of residences for their preachers. It is proposed to have two classes, first and second, with two varieties for each. The first class to cost £500 and £450 each, and the second from £350 to £400. In furtherance of this object, Mr. John Boyd, architect, of Belfast, has furnished plans, specifications, and quantities, which are proposed to be printed. In the arrangement of these residences, commodiousness and comfort have been more considered than external display, and they are designed to suit towns or the vicinity of towns, one of the plans being for a three-storey street house.

St. James's Roman Catholic Church, James's-street.—The interior of this important Gothic edifice is nearly completed. It is finished in the decorated style. The aisles are divided from nave by 16 richly-moulded arches, 12 feet by 27 feet; the moulded bosses are of cast iron; and the columns are executed in Portland cement, with foliated capitals, richly carved. The middle shafts in front of great cluster columns are continued up to the springing of the rib mouldings of groined ceiling, the latter being 14 feet from springing of capital to the apex, with longitudinal, transverse, diagonal, crown, intermediate, and wall rib mouldings, with bosses worked on the intersections of different patterns. The nave is lighted by 16 clerestory windows, with moulded jambs, columns, bases, and foliated capitals, supporting cluster arch mouldings. The 16 opens of the triforia have moulded jambs, double-clustered columns, bases, and foliated capitals, and cluster arch mouldings. The abacus of the capital supporting groins is continued on a level with the seats of the clerestory windows. A moulded string course is continued on the level with the seats of triforia, opens and breaks over isolated columns supporting ribs of groins. The nave is finished, and looks light and graceful; the works of the aisles are progressing. It is expected that the interior will be finished before St. James's day. The cost of bracketing and clustering amounts to £1,660. Mr. Thomas Connolly is the contractor.[*] The chancel has been plastered, 14 months ago, at a cost of £95. This church was erected from designs by Mr. Patrick Byrne, architect.

---

[*] By our advertising columns it will be noticed that portions of the plastering, including the chancel arch, of this church were executed by Mr. C. W. Giblan.

ON THE CONSTRUCTION OF EASTERN BATHS.

It is very remarkable that the revival of Roman baths should be due to Ireland, where we find no traces of their former existence; whilst those countries which formerly possessed them will now have to learn from us the manner of their construction. I have already made the public aware of some of the localities where their ruins exist, and of those countries in which they are still in operation; and I have now to inform them that the details of their construction are as varied as the different races and tribes which have employed them.

I have spoken of the baths of the east on a former occasion as "hot-air baths," in order to draw as wide a distinction as possible between "steam baths" (which are known in this country, and so much used in Russia) and those in which vapour exists but in small quantity, *and does not form the essential feature of the bath*. But it must be admitted that in some eastern baths the amount of moisture in the atmosphere is often very considerable, so as to make it difficult to select a name which is not calculated to mislead. For instance, in Egypt and Hindostan, hot water is one of the chief means employed for the diffusion of heat, and the vapour which it unavoidably gives off produces a dimness in the apartment; but it is, nevertheless, very different from the Russian bath, in which clouds of steam are raised, and one can scarcely see any part of his own person. The mode of heating baths in Hindostan displays a complete indifference to expense, which is not likely ever to be imitated in this country. Let the reader picture to himself a great octagonal building, having a large tank sunk in the centre, and supplied by eight boilers, all heated at the same time by eight distinct furnaces, and he will have some idea of the waste of fuel and water which must take place in them; more particularly when he is informed, that before leaving "the bath," every bather makes use of this basin, which must be separately filled for each. In the "Arabian Nights" mention is also made of a tank (or large warm bath sunk in the floor), in which ablution was performed, after the skin had been thoroughly operated on by heat, shampooing, and the use of "the glove;" while in modern Egypt, and some parts of the Turkish Empire, *fountains* of very hot air are made use of, for the purpose of warming the rooms, in addition to the flues which are placed beneath the floors. I need hardly remind the architect that this apparently trifling circumstance requires special attention when the plastering of the interior is to be considered. In the Russian bath, steam is raised by throwing water on stones, heated by a stove, in the centre of the vapour chamber; and benches are raised (as in a theatre) one above another, round the walls, so as to increase the accommodation and comfort of the bathers, who finish their bath by either taking a cold plunge bath, or having pailfuls of cold water thrown over them. Some travellers assert that they roll in the snow; but I should think that this is not often done. Although these baths are infinitely superior to the troughs of hot water which have come into use in modern days, yet they are themselves very likely to be superseded by the true hot-air bath, which always has been in use, and seems now to be looked on with some of the favour which it deserves.

I have been asked why I do not wish to see any plan or model of a Turkish bath set up for universal imitation in this country, and why I myself have not brought home such a plan? To which I reply, that although the style of Eastern architecture is as eminently picturesque as the buildings of the West are vulgar and pretentious, yet a thoroughly Oriental building would be out of place in any of our cities, neither could its details be carried out, without the actual importation of foreign workmen, who, after all, would not be worth the trouble or expense of bringing them over. The general aspect of Saracenic buildings is now becoming familiar to every one, from the prints in the *Illustrated London News* and other excellent periodicals; so that our builders are without excuse if they fail to make themselves master of the practical details of this beautiful, simple, and ancient order of architecture. In this country it should be recollected, that when it is desired to construct baths on the same principle as those used in the East, a most important modification must be made in the heating apparatus, to adapt it to the inevitable change of fuel which our national resources suggest. No one would think of employing anything but coal, coke, or some modification of this useful mineral, in a country where it is so cheap compared with all other kinds of fuel; while in the East, wood is *almost invariably* employed. I took the trouble of going into the stoking-room of a large public bath in Constantinople, and had the door of the furnace opened for me to look into, which was (I can safely say) no joking matter! The door of the furnace was about three feet square, and inside were huge billets of blazing wood, giving out a tremendous heat. From behind them, in every direction, ran flues, cut out of a kind of stone, which is employed for this purpose exclusively, and cannot be obtained in England. These flues permeated the walls also, so as to make them double, which is a very good plan, as thus a non-conducting layer of smoke is interposed between the heated chambers and external wall of the building. The cleaning of such flues, or the passage of smoke into them, need not, however, be considered matters of any importance; as the presence of heated air *which does not mingle with the air of the bath*, is all that is necessary. Indeed, from the manner of their construction, so little smoke actually does enter them, that a bath may become old with service without their ever requiring to be swept. I had an opportunity of seeing this in two baths which were in a state of partial demolition, leaving the side flues exposed.

The number of chambers in an eastern bath is altogether a matter of taste, and depends very much upon the locality. For example, at Tunis and in Algiers, five or six chambers, of increasing temperature, are used; at Smyrna and Constantinople, three or four; and at Cairo and Alexandria, four or five; while in private houses and hospitals, one, two, or three are generally considered sufficient. If we compare modern Turkish baths with Roman thermæ, under the emperors, we shall find a very great change for the better, in the comparative simplicity of the Mussulman customs. Indeed, I should be the last man in the country to advocate the abuse of the bath, which undoubtedly took place during the decline of the Roman Empire, and which has led many to stigmatize the institution itself, as the cause of evils which could only exist in a people whose energies had been dwarfed by tyranny, and enfeebled by luxury and effeminacy. The *numerous apartments* of these mighty palaces, whose ruins compel our admiration, can never, therefore, become objects of our imitation; but what is much better than external splendour, will be the practical utility and simple elegance of those "temples of cleanliness," which are destined ere long to spring up throughout the length and breadth of the Emerald Isle.

The number of apartments in a public bath ought *never to be less than three*, in order to insure comfort and safety to its frequenters; and I need hardly say that it is of the highest importance that proper provision should be made for ventilation, in rooms whose temperature is maintained continually at such an elevation. Fortunately *this very fact* renders the production of currents for the above purpose so easy, that he must be a bungling fellow indeed who would find any difficulty in maintaining a circulation of pure air within the heated chambers of a "Turkish bath." I can only conclude by expressing a hope that due attention may be paid to a matter which is essential to the salubrity of this refined enjoyment, and which is a *sine qua non* in the employment of "hot-air baths" for medical purposes.

Edward Haughton, M.D., M.R.C.S.E., M.R.D.S

PROJECTED OPENING OF THE CITY SQUARES FOR PUBLIC RECREATION.

We should be the last to throw cold water on any project either having a sanitary tendency or conducing to the moral elevation of the working classes, who form such an important section of the community, and in whom we are presumed to take more than *ordinary* interest; but we confess we are not quite so sanguine, either as to the success of this project if carried out, or so satisfied as to its desirability, as many of our respected fellow-citizens who took part in the recent important debate at the Town Council. True, it would be "a consummation devoutly to be wished" if a park—nearer than our world-famed Phœnix, and more accessible to the working man and his family than are the suburbs of this metropolis—could be obtained; but *private* interests should be respected, and to convert Stephen's-green, or *any* of the city squares, into a park, would be to destroy all the house property adjoining, and cause the speedy exit of the aristocratic inhabitants. Rather would we earnestly impress on the Lord Mayor and Town Council—who seem to have taken the matter up so warmly—to reclaim some of the districts now mere swamps at the north side, and convert *them* into a park, thereby achieving a double purpose; or if one at the south side, and in the vicinity of Stephen's-green, be at all desirable, we should say move on a little farther into *more salubrious atmosphere*, and make the Portobello Gardens—where another essential element is easily obtainable, viz., *water*—a people's park, and where they can pursue their recreative sports uninterfered with, and without detriment to the property of fellow-citizens. We shall probably enlarge on this subject at an early moment.

Mountmellick Town Commissioners.—The rising town of Mountmellick has been placed under the operations of the towns improvement act. A meeting of the commissioners was held recently for the establishment of a gas company under the limited liabilities act, and there appeared to be a general wish expressed for carrying it into effect. The total amount of money required is estimated at about £2,500, which it is proposed to appropriate in £5 shares, and the project seems to be favourably entertained by the inhabitants of Mountmellick.—*Leinster Reporter.*

MONUMENTS AND MEMORIALS NATIONAL.

THE GOLDSMITH TESTIMONIAL!

"Make haste slowly, they stumble that run fast," is a proverb of "Poor Richard's" that the committee of the testimonial projected to his memory would have wisely kept in view and acted upon, rather than arrive at a decision so conclusively and at so early a stage respecting the site. The all-important question of "suitability" seems to have entirely given place to that of "association," for which, though we entertain the highest respect, we are nevertheless slow to admit as entitled to take precedence of *all* others. Viewing artistically the proposed position of the testimonial, we cannot reconcile the principle which induced the committee to contemplate placing a statue—or statues, as in embryo—a few yards in advance of a high wall, and ranging with a railing intended to define a thoroughfare. The space in front of the University is quite too limited at present for the display of sculpture; but to reduce it still further by 10 feet, and introduce pedestaled figures, is perfectly preposterous. The reduction of the area would be a decided boon to the public; but let our artistic taste be saved from *another* stigma in the unsuitability of our national memorials. If *we* might submit a suggestion as to the arrangement of this area, we should say, "Take down the old railing, and do *not* erect a new one; but flag over the entire space—save a carriage-way to main entrance level with present pathway, and define the college boundary either by dwarf stone piers, connected by chains, or with small trees, protected by palings, as in some of the greatest thoroughfares in continental cities." Further—if the philanthropic spirit of the enlightened Board of Alma Mater permit—the introduction of two ornamental drinking fountains, with *jets d'eau* casting water to a great height at all times (as is practicable), would not only be much more consistent architecturally than the proposed arrangement, but confer a public benefit, and follow an example worthily set by English towns.

With a memorable example before their eyes, let the committee avoid past errors; for where the public purse is appealed to, public opinion should be respected, and public odium is sure to fall with double weight in this instance, should the result prove *a failure.*

By all means we advocate a statue for "poor Goldy;" and if the Board of Trinity College desire, out of their own well-filled coffers, to defray the expenses of the erection, the matter then assumes a *private* character, and we should be silenced; but if, on the other hand, the memorial is to be *national*, and the public to contribute, we say emphatically that the site selected is unsuitable, and the first step in the proceedings bespeaks a dissatisfactory termination.

Local Building News.

The competition for the new church for the Molyneux congregation has been decided in favour of Mr. Rawson Carroll, architect. Several of the plans sent in displayed great merit, especially those by Mr. W. J. Barre, of Newry, and Messrs Carmichael and Jones. Amongst the competitors were, Messrs. Isaac and William Farrell, J. M'Curdy, E. Carson, F. W. Courtenay, J. Burne, &c. The building will be a very handsome addition to the city; and we are glad to see towers and spires on the increase, of which there was a palpable scarcity here. The particulars of approved design are briefly these, cruciform plan, with nave, aisles, oblong chancel (33 feet by 21 feet), and transepts (94 feet by 25 feet); tower and spire at north-east side, next transept; organ-gallery and vestry at either side of chancel, and staircases at west end next entrance-porch, which—having sittings at either side—is 13 feet 9 inches deep. Internal dimensions, not including porch, 78 feet 9 inches by 55 feet 8 inches (of which width the nave is 30 feet); height to soffet of ceiling, 48 feet; to ridge, 60 feet. Roof, semi-polygonal; and gallery all round external walls. Cast iron columns, with caps and bosses, and wrought-iron arches and ribs, with ornamental spandrils, separate nave from aisles.* The style is a composition of early and decorated Gothic; granite is proposed for the rubble walling, and Scotch or other stone for the dressings. Estimate cost, £7,000

So far it is probable that Carlisle-bridge will *not* be widened; but the project of erecting a new bridge opposite the Custom-house, and thereby dividing the traffic, is talked of. We apprehend that *both* must ultimately be done.

Messrs. Pim, Brothers, of South Great George's-street, are newly fronting, in Italian style, their monster establishment—Messrs. Hogan and Son, of Great Brunswick-street, are executing the plastering; and Messrs Cannock and White are also improving their premises, under the direction of Mr. Anthony, architect; Mr. Harford, the builder.

We understand that nothing definite has been as yet decided respecting the South Dublin Union buildings, although estimates were received, and a contractor declared. The tenders displayed great discrepancy in the calculations.

The demolition of the existing houses on the site of new club-house at Kildare-street is being proceeded with by Messrs Cockburn, the builders.

Builders are busy in our city, and "shop architecture" is improving, especially in the leading streets. So far, we may look forward to a stirring season. Some new matters are in embryo, of which we shall speak fully hereafter.

Architecture in the Provinces.

New schoolhouses are to be built in the parishes of Ardpatrick and Meelick, in the County Limerick.

The foundation stone of a testimonial to the late Daniel O'Connell, M.P., has been laid at Ennis.

A new convent is to be built at Bantry, Co. Cork; also at Roscommon. Mr. John Neville is architect to the latter.

A tower, about 65 feet high and 17 feet square, has been added to Arklow Church, after designs by Mr. Welland; Messrs. Barker, builders, who have executed large contracts for the Ecclesiastical Commissioners, amongst which is St. John's Church, Limerick, recently noticed.

St. Patrick's Bridge at Cork is to be rebuilt, and tenders are being received.

New gas works are to be built at Mullingar and at Newbridge, for which estimates will be received respectively to the 8th and 11th inst.

Works are to be executed at St. Michael's Roman Catholic church, Tipperary; tenders receivable till 9th inst.

New Roman Catholic churches are to be built at Dundalk—Mr. John Murray, architect; and at Raheen, Queen's Co.—Mr. J. S Butler, architect.

The Ecclesiastical Commissioners have advertised for tenders for repairing works at churches in city of Dublin and Co. Tipperary, and alterations in Co. Carlow.

The Grand Jury of the Co. Fermanagh desire further accommodation for themselves, together with other works, in the Enniskillen Court-house, and are prepared to receive plans. No premium offered!

The Roman Catholic church of St. John's, at Sligo, has been considerably enlarged and beautified.

A new Wesleyan Methodist chapel, at Celbridge, was opened on the 9th ult. The plan is a parallelogram, with vestries at east end entrance and porch at north side of nave. In style it is Gothic, with three single lancet-headed windows between buttresses on each flank, and a treble light ditto in west gable. The ceiling is pedimental in section, and divided into four bays, with moulded ribs, &c. The pews have ornamental ends and are open. Mr. E. F. Tarleton was the architect; Mr. Bynell, of Trim, the builder.

The first stone of a new Roman Catholic church has been laid at Waterville.

The foundation stone of a new Independent Church was laid recently at Donegal-street, Belfast. A silver trowel was presented to Mrs. R Workman, and she performed the ceremony. The following is a description of the church:—It will be in the early decorated style of Gothic, and consist of a nave of five bays —68 feet by 35 feet—two of the bays having coupled transepts; width across transepts, 55 feet. Behind the pulpit will be vestries, with organ gallery over, opening to the church by a lofty arch with carved screen. The floor of the church will be 13 feet above the level of street; the space beneath being occupied by school-rooms and lecture-rooms on the ground line. The roof, which will be partially open-timbered, is to be ceiled to the collar-beam at a height of 36 feet from the floor line, and will be panelled with richly moulded ribs, the principal timbers having semicircular moulded arch trusses, and hammer beams with carved feet, and the spandrils filled in with cusped tracery. Seats are provided for about 560 adults, and have carved and moulded bench ends, but this number can be increased to upwards of 800 by the addition of galleries. The building will recede 15 feet from Donegal-street, the sides and rere being in plain brickwork, with massive buttresses, chiefly from the materials of the old building, each bay of the nave and transepts having a two-light traceried window, and three-light square-headed window to the school-rooms and lecture-room. The design embraces two houses, in the same style as the church, one on each side, filling up the whole frontage to Donegal-street, the fronts coming up to the street line, and leaving only the principal front visible, recessed between them. The erection of these is for the present deferred. The principal front will show a Galilee porch extending the whole width, and 20 feet in height, with an elaborately moulded shafted and pedimented double doorway, in the centre approached by a handsome flight of steps from the street, with wrought iron railings and gates. Above the porch will be the principal feature of the design, in a richly-moulded and traceried window of eight lights, grouped in four and two, with floriated caps to the jambs. The gable will be of equilateral pitch, and rising to the height of 64 feet from the street, level with a triplet-lanced window in the apex, and the whole crowned with a crocketed and canopied square spirelet, rising to a height of 90 feet to the top of the vane, and supported on four shafts with carved caps, the projection from the face of the wall being carried by carved corbels. The front will be entirely of Scrabo stone. The works are being carried out by Mr. John Ross, contractor. The church will be heated with hot water, and lighted with elegant brass standards, by Messrs. Hart, of London; the whole carried out from the designs, and under the superintendence, of Mr. Raffles Brown, architect, of Donegal-place. Although the laying of the corner-stone has been unavoidably delayed until the present time, the works are far progressed, the side walls being nearly ready for the roof.

---

* A new feature in this country, but not without precedent on the Continent.—Ed.

Railway Matters.

The committee of the House of Lords appointed to determine the merits of the rival lines of railway between Cavan and Clones—the one promoted by the Midland Great Western of Ireland, and the other by the Dundalk and Enniskillen—have decided that the latter company should make the line, provided it be completed against January, 1862; and if not, then the former company shall be empowered to construct it. The Ulster Company propose to extend from Clones to Monaghan, which would complete railway communication between Galway and Belfast.

A bill is promoted by the Great Northern and Western Company for a line from Castlerea to Castlebar, at a probable cost of £220,000, or £6,000 per mile—Mr. John Fowler, C.E.; also a bill is projected by a new incorporation called the North Western Railway of Ireland, to construct a line from Elphin to Ballaghadereen and Swinford; and again, a bill is promoted by the Midland Great Western Company to enable them to abandon a portion of their authorized line between Longford and Boyle, and to substitute a line by the eastern bank of the Shannon, and passing through the county of Roscommon instead of that through Leitrim, as originally proposed. The original project of the Great Northern and Western Company was to make a line from Tullamore to Athlone, Roscommon, Castlebar, Sligo, Westport, and Ballina.

Railway communication between Dublin and Gorey is proposed to be made by means of the Wicklow line. The distance travelled now between Dublin and Enniscorthy, per the Great Southern and Western Railway, is 108 miles; whereas by the proposed route it will be but 78 miles.

The object of the Derry and Loughswilly Railway Bill is to authorise the Derry and Coleraine Railway Company to construct the following work:—A railway, commencing at a proposed embankment of the Derry Port and Harbour Commissioners, on the western shore of the river Foyle, and terminating at a proposed jetty in the Farland Channel of Lough Swilly, being a distance of 9½ miles. The bill takes no powers for the construction of the jetty alluded to. Their lordships assent to the bill on the following conditions:—1. That plans of all the works below high-water mark of Lough Swilly be submitted to and approved by their lordships before the commencement of the work, and that the work be only carried out in accordance with such approval. 2. That where the line skirts or interferes with the river Foyle or Lough Swilly, no deviation from the black continuous centre line of way be made without the previous sanction of the Admiralty.

New Patent Cooking Apparatus.—Sir—Mr. Radley, of Dublin, has recently patented a novel cooking apparatus. By his arrangement, any number of troops on the march, crews of vessels of war, emigrant ships, barracks, hospitals, poorhouses, and other large institutions, besides hotels and private establishments, can have any quantity of edibles prepared in an exceedingly economical, expeditious, and cleanly manner. It will roast, boil, bake, steam, fry, all at the same time, with considerably less fuel than is now required for the best constructed ranges, and in a much shorter space of time. The construction of this apparatus is simple and easily understood, and not at all liable to get out of order. It has an enclosed jack for toasting, which is made to rotate with the smoke of the fire, spring weight, or steam (or it can be worked by the hand), the principle being self-acting. The boiler is so contrived as to steam large quantities of vegetables, &c., and, at the same time, heat several gallons of water. I carefully examined the apparatus in full operation, and can strongly recommend it. If you think well of inserting this slight description of a very useful invention in your widely-circulated journal, it will oblige your obedient servant, F. W. Courtney, architect.

A gas-illumined car came through New York by a midnight train recently over the Worcester route. During the nine hours occupied in the trip only ten cents' worth of gas was consumed, and the car was lighted up as brilliantly as a parlour. The gas metre, holding the required quantity of the subtle fluid, is placed underneath the car, from which pipes supply a jet at either end of the interior.

Reviews.

Rural Architecture. By J. Sanderson. London: Wm. S. Orr and Co.

It rarely happens that one meets with two distinct works bearing the same name, but so it has in our case; for our readers may have perceived that in our January number we gave a notice, under the above title, of a book by Mr. White, architect, published by the eminent firm of Blackie and Son. That now before us must not in any way be confounded with *it*, as the one is a large volume, composed of twenty-one parts, each costing 2s., whereas the other —the subject of this notice—is but *a shilling* in the total. Not the less meritorious, however, may it be, because of its cheapness, but judging from its comprehensive, and varied compilation, and its many and well-executed lithographed views—attended with much outlay—it must have become a general favourite to prove renumerative.

In the introduction, which is particularly well and sensibly penned, we find the following passage:— "The scientific architect or builder will, perhaps, smile on perusing its contents; the student who aspires to that elevated position may, however, treat himself with injustice in passing them by with indifference." True, the designs *do* savour somewhat of the amateur, but nevertheless in that regard display both taste and ability. As a general principle, we advise books of this class not to be too much trusted in, either by intending builders or students, as their contents necessarily cannot provide against the contingencies of circumstances and requirements which each individual case presents, and they serve to cramp the designing capacity of those who adopt architecture as their profession; but, perhaps, the best feature in that before us is its absence from presumption, inasmuch as the author takes especial care, more than once, to advise those who decide to build, to "apply first to an architect of talent and experience."

The various artificers' works in a building, are entered into both by specification and instruction as to the mode of measurement likely to be useful in a degree to those who build in the absence of a professional man, and who despise the doctrine that a "little learning is a dangerous thing"

Headstones, Tombs, and Monuments. By D. A. Clarkson, Architect and Sculptor. London: Atchley and Co.

They who ramble in cemeteries cannot fail to have their optical faculty offended by the incongruous and distorted features, in the shape of monumental designs, which present themselves, promiscuously huddled together, in every available spot. To enable those on whom the melancholy duty devolves of erecting a structure, however simple, to the memory of a departed object of regard, to select from designs presenting a greater variety than the stereotyped forms usually met with in the ready-made stock of headstone manufacturers, was the object of the author in preparing this work. Judging from the numbers before us—viz., parts 1, 2, and 3—the book promises fairly; and perhaps its strongest recommendation is, that it is published under the patronage of the Earl of Carlisle, whose judgment in artistic matters is so well known and appreciated both in Ireland and elsewhere. In offering our opinion upon its merits in the respective departments, we should say that in the designing of headstones—perhaps the most difficult of the three—Mr. Clarkson decidedly excels; those in the Gothic style especially displaying much novelty, and in many instances either pleasing quaintness or gracefulness in the contour. As we doubt not that the succeeding numbers will enable us to speak more confidently and more fully, we reserve a more extended notice.

Skyring's Builders, Contractors, and Manufacturers' Diary and Daily Journal for 1859. Published by the Author, at 4, Copthall Buildings, London.

In addition to a systematically-arranged daily and weekly journal, time account, ledger forms for the year's receipts and expenses, &c., this work contains much information sought for in the course of every-day business—viz., complete postal regulations, almanac, stamp and tax lists, building memoranda, tables showing prime cost of deals, planks, and battens, the Building Act, &c. It should be on the office table of every architect, engineer, and builder who desires to keep his engagements and pursue a systematic course.

Facts and Fallacies of the Sewerage System of London and other large Towns. By Jasper W. Rogers. London: Atchley and Co.

However widely different and various may be the opinions of our engineers and sanitary improvement agitators respecting the most *effectual* and desirable mode of sewerage for large towns, certain it is that experience and public outcry establish *one fact*, that the present system adopted in the United Kingdom is not only defective, but most pernicious to the health of the community. The author's name of this little work is an acknowledged guarantee—even for the oppositionists to his principles and sewerage schemes—that it is not introduced to public attention as the mere experimental essay of a novice, but as the conviction derived from many years' practical experience in, and, we may add, devotion to, matters having a sanitary tendency. Mr. Rogers advocates the system peculiarly his own design—of dry tunnelling, with communication thereto from the houses at either side of streets, and in which both gas, water, and house-refuse mains may be placed in an accessible position; the establishment of public lavatories and closets; but repudiates both the shape of the sewers now in use as unsuitable for carrying off excrement, and, above all, the discharging of such sewers into rivers and streams as most pernicious. The pamphlet is a clever production, in many respects incontrovertible as to argument, and well deserving of perusal.

An exhibition of works of art, by living masters of all nations will be opened at the Hague on the 23rd of May, which is to last till the 4th of July.

Recently the Catholic municipality of Vienna contributed £5.000 towards the construction of a Protestant schoolhouse. His Majesty the Emperor has just given 8,000 florins towards a new church for the Jesuits, but he has also contributed the same sum towards a place of worship for his Protestant subjects.

A statue of St. Peter, modelled after one at Rome, has been raised to one of the niches in front of the Catholic church of St. Peter, at Philadelphia, in presence of a large number of persons. The figure is seven feet high, and made of Acadia freestone. A statue of St. Paul of similar size will soon be raised to a contiguous niche.—*New York Tablet.*

Sir John M'Neil, C.E. has recently returned from a professional tour in Copenhagen.

Miscellaneous.

Analysis of a Soil.—To ascertain the probable properties of a soil, the following simple test may be applied. Take about a pound of the soil, and same quantity of subsoil lying immediately beneath, and place them in canvas bags labelled. A difference of subsoil, will cause a difference in degree of fertility. The portion of each, which is to be used in qualitative and quantitative analysis, having been carefully dried in the air, and well mixed, place them in a stoppered bottle. To determine the specific gravity, dry some of the soil at 212 degs., and introduce it into the specific gravity bottle half filled with distilled water (hyd. 57). Agitate well about 500 grains with hot water in a large flask, and pour the whole mixture into a jar, allowing it to stand for a couple of minutes; after which pour off into another vessel the water, and the finer portion of the soil suspended in it. Repeat this until nothing but sand and gravel are left behind Thoroughly dry the latter, then pass it through gauze sieves, of different degrees of fineness. Then weigh the separated portions, moisten them with water, and examine them with a microscope, to learn the substances of which they consist. If moistening them with a few drops of hydrochloric acid causes effervescence, *limestone* is present; if a brown colour has been imparted to the acid, *peroxide of iron;* and if there is a smell of chlorine, *peroxide of manganese.* The other ingredients likely to be found are detected by the appropriate tests.

Newhall House, Milwaukee.—The *Wisconsin Chief* says "this is one of the most imposing and complete hotel structures on the continent; a model institution of the kind, and comprises within itself, complete and princely homes for a host of people, having under its roof all that is luxurious, convenient, and substantial. The dining-room is an institution peculiar to itself—a spacious hall, and dotted over, at neighbourly intervals, with oval tables, whereat families, parties, or groups of friends can sit down cozily together, none to disturb them. The most fastidious epicure will find at the Newhall all that he can desire. The waiter, whose trying duty it was to assist us in making out a breakfast, manifested no astonishment *at finding a mammoth cave under our moustache.*"

New and Cheap Light.—A patent has been taken out by the Hon. W. E. Fitzmaurice for a cheap and brilliant gas which will supply 500 street lamps, lasting 12 hours, at a cost of 3s. 7d.; and for domestic purposes, during a similar period, a jet, equalling in effect 18lbs. of candles, costing only 4d., and furnishing a light fully equal to three argand lamps, and double that of any ordinary gas-burner. The requisite apparatus is cheap, perfectly portable, and capable of being managed by a child; the light free from smell, extremely pure, and characterized by the property of burning steadily, continuously, and without diminution. [It remains yet to be proved how far applicable to general purposes this gas may be: its inodorousness being a decided disadvantage, as the great safety of the ordinary coal gas is the facility which it affords for detection of the slightest leakage.—Ed.]

Gutta-percha Packing and Wall Paper.—A French journal says that a new kind of paper for packing has just been invented, which differs from that in use by its being covered with a very thin coat of gutta-percha, which renders it proof against humidity. In order to obtain this result, the gutta-percha is made liquid, and by means of rollers the coating is equally spread to any thickness required. Such paper might be usefully made for covering the walls of rooms which are damp.

Napoleon's House at St. Helena.—In addition to the reconstruction of the house occupied here by Napoleon I., and of his tomb, the French Government has resolved on reconstructing likewise General Bertrand's house, and also on placing a statue of Napoleon on an eminence in view of the sea. An engineer officer has just been sent out to execute these works on plans approved of by the Emperor.

The Epidemic of 1858 in New Orleans.—The yellow fever has just ceased its ravages, after prevailing since July. From June 20 to November 21, the official reports show that the deaths in the city amounted to 8,296, of which 4,850 were of yellow fever, and 3,446 of other diseases. The average deaths were 473 per week, or 67 per day, the population being about 160,000, or one-fourth that of Philadelphia. The epidemic is considered by the inhabitants as a *mild* one.

The late James Gandon, Architect.—We have chanced on a number of a local Journal, dated 1823, with the following scrap relative to the decease of this eminent architect, which is sure to prove interesting to our readers:—At Lucan, on Wednesday morning, aged 83, James Gandon, Esq. While the noble buildings with which this metropolis is embellished remain, the genius of this artist must be known and acknowledged. His friends and all those who had the satisfaction of an intercourse with him in private life, must have deeply impressed on their memories his companionable and very gentlemanly manners. As an architect, Mr. Gandon has left us many splendid proofs of his abilities. He built the Custom-house, the Four Courts, the noble Corinthian portico opposite College-street, the Inns of Court, &c., &c. On Saturday morning he was interred at Drumcondra, in the same grave with his distinguished friend, the celebrated Grose, who wrote, amongst other works, the "Antiquities of Ireland."

Regulation of Burial-grounds.—By a recent order from the Lord Lieutenant and Privy Council, it is, amongst other matters, provided that "every burial-ground shall be kept properly fenced, and, if necessary, under-drained, so as to prevent water from entering any grave or vault; grave spaces for burial of persons above 12 years of age to be at least 9 feet by 4 feet; and under that age, 6 feet by 3 feet; each grave when first opened to be eight feet deep; no unwalled grave to be re-opened within 14 years after the burial of a person above 12 years of age, or within eight years after the burial of a child, and in no case human remains to be removed; no coffin shall be buried in any unwalled grave unless the upper surface thereof be at least four feet below the ordinary level of ground."

Progress of Victoria.—This town now contains 7,000 people, a large amount of shipping is in the harbour, there are extensive marts of trade, busy and populous thoroughfares, and large buildings in course of erection. The British ship *Ganges* recently brought out 200 troops, who are now engaged erecting barracks. The Royal Engineers corps has also arrived, and is about to commence a survey of a proposed railroad to Halifax.

Interlaced Ornamentation on Ancient Sculptured Stones.—Mr. French, of Bolton, near Manchester, has published a very elaborate treatise on this subject, as regards sculptured stones in Scotland, Ireland, and the Isle of Man; and attributes the interlacery on ancient Irish monuments to the imitation of basket-work, formed from interwoven osiers by the ancient Celtic people, Irish and Welsh—a theory which appears to our mind very questionable.

Sunday-opening of the Crystal Palace, Sydenham.—At a recent meeting it was finally carried, by a majority of 17,021 votes, "that the opening of the palace grounds to shareholders on Sunday afternoons, should be continued as heretofore." We trust this advantage will be extended to the working classes.

Alterations at the Drogheda Gaol.—This building, which presented by its construction many impediments to the carrying out of an effectual and reformatory prison discipline, is about being remodelled, so as to provide forty cells, with all the other arrangements on the separate system, which of recent years has come greatly into favour in Ireland. Mr. Hammond is the contractor, and he has undertaken to complete the works in fifteen months.

The Irish Peat Company has been dissolved with an enormous loss, it appearing from an official statement that of the paid-up capital of £62,000 only about £4,000 will remain after paying debts. The sale of the stock and works for the sum of £4,750 has been authorized. The result is much to be deplored, as the company gave a great deal of employment where it was much needed.

ATMOSPHERIC[*] AIR.—It is doubtful whether or not this is a compound, or merely a mixture; the latter is more probable. It is tasteless, it is inodorous, and, when in common quantities, without colour. It is a bad conductor of electricity. Being the standard of comparison for the gases, its specific gravity is represented by unity. Compared with distilled water, it is 0·00122; and is, therefore, 820 times lighter than that fluid. If the barometer is at 30 inches, and the thermometer at 60°,100 cubic inches of atmospheric air, free from moisture and carbonic acid, weigh 31·0117 grains. The height of the atmosphere has been estimated at 45 miles, and its temperature decreases one degree for every 325 feet of ascent. This decrease is due to its greater distance from the earth, which heats it by contact; also its specific heat being increased by its rarity, it requires a larger quantity of caloric to raise it to a given temperature. Poisson supposes the air in the upper regions to be so cold as to be actually frozen, in which case our earth and atmosphere would be contained in a frozen shell of frozen air; but others dissent from that opinion, and prove that at the lowest temperature we can produce, atmospheric air does not show any tendency to become even a fluid much less a solid.

NEW YORK.—Notwithstanding its admirable position for drainage, and its great Croton Aqueduct, which supplies the city with 60,000,000 of gallons of water daily, New York is one of the dirtiest cities in the world. For several years it was generally supposed impossible to sweep its main thoroughfare, Broadway—but an enterprising hatter having demonstrated the practicability of the task, it has since been kept tolerably clean; but the rest of the city seems to be past all hope of broom or shovel. The streets are wide, and are laid out generally at right angles. Its hotels are built on a palatial scale, and there are many other fine buildings but the irregularity which prevails is a great hindrance to a general architectural effect. The Archbishop of New York, last August, laid the corner-stone of a new cathedral, which promises to be the great architectural feature of the city, and to compare favorably with some of the finest ecclesiastical edifices of Europe.

A MAGNIFICENT BRIDGE.—The Royal Albert Bridge, at Saltash, surpasses the utmost triumph yet attained by the skill of the engineer It is to serve as a viaduct for the Cornish Railway from Plymouth to Falmouth, and crosses the Tamar. On the Cornish side the land rises to a height of some hundred feet in steep and rugged abruptness from the waves at the point of intersection; while the opposite shore is crowned by a more sloping ascent of almost equal height. From point to point of opposing eminence is rather more than half-a-mile, and across this wide chasm the viaduct stretches. The arches from end to end, are 19 in number, 15 of them being wider than the widest of Westminster Bridge. In the centre of the stream is a mighty cast-iron pier of four columns, and from this spring two giant arches, which span the whole width of the actual stream, upwards of 900 feet! The bridge in its entire length, exceeds the Britannia tube by 300 feet, being nearly 750 yards from the first pillar to the last, while it measures from foundation to summit not less than 87 yards. To obtain a foundation for the central pillar, a depth of 85 feet below high-water mark had to be sounded; a space of 36 feet in diameter, through clay and mud, had to be excavated, and the rock to be so levelled into steps as to be fit to receive a structure weighing upwards of 3,000 tons. This difficulty alone would have daunted an ordinary mind; but it served only to stimulate the genius of Mr. Brunel. The Menai tube is a pure suspension bridge, and the main tower had a ready-made foundation in the Britannia rock, from which the whole structure derives its name; but Brunel had no such extraneous assistance, and the triumph which he has achieved is all the greater. Of the enormous dimensions of the whole structure some idea may be formed from the fact that in the construction of the bridge there have been used of wrought-iron 2,700 tons, of cast-iron nearly 1,200 tons, of masonry and brickwork more than 1,500 cubic yards, and upwards of 15,000 cubic feet of timber. The stone piers at the water's ed e are 190 feet high, 29 feet wide, and 17 thick; and the length of each arched tube is upwards of 450 feet. The bridge will be finished in May next.

AN EGYPTIAN TOMB.—A writer remarks, that "when examining a tomb discovered by Belzoni, it is impossible adequately to describe the sensations of delight and astonishment which by turns took possession of our minds, as we moved along the corridor, and examined the different groups and hieroglyphics that occur in every successive chamber. We had been told that what we saw was a tomb; but it required a constant effort of the mind to convince us that it was such. Only one sarcophagus in one chamber, and twelve chambers, exclusive of the long corridor, all highly ornamented, for nothing! It may have been a subterranean temple, exhibiting the religious creed of the worshippers, or the rites of initiation. It may have been a subterranean palace like those of the king of the Troglodytes. But never was there such a superfluous waste, if we are to suppose that all this was done merely for the reception of one sarcophagus."

ANTIQUARIAN DISCOVERY.—Recently an ancient kist or grave of the primæval ancient Irish was found at Clough, Co. Antrim, near the old Castle; it was built of rough stones, and enclosed nothing but fragments of human bones. Shortly after discovery, the kist was broken up, and filled in with clay, so that it is no longer visible.

A new town, to be called Sophiisk, at Djai, is to be built in Siberia, on the right bank of the Amoor.

OMNIBUS TUNNEL THROUGH LONDON.—The proposal to carry an omnibus subway from Westminster to the Royal Exchange is being matured, and the details of the plan proposed have been submitted to a considerable number of competent judges, who fully admit the practicability of the scheme. The space required for the passage of trains running to and fro is 14 feet in width, and 8 feet in height. To construct a tunnel through these streets for ordinary railway carriages would be almost impracticable; but a subway of the dimensions above can be made without any practical difficulty. The guage proposed is 4 feet 8½ inches the same as all narrow-guage lines; so that, should the system be extended, the subway trains might be run on to all the metropolitan lines, except the Great Western, which is the wide guage; thus giving access from the suburban districts to the heart of the city without change of vehicle.

The town of Bagnalstown has been lighted with gas—Messrs. Edmundson and Co., of Capel-street, being the contractors for the necessary apparatus and supply.

TENDERS

For alterations, additions, new shop front, &c., to 29, Westmoreland street: Messrs. Sheils and Scott, proprietors. Mr. J. J. Lyons, architect. Limited competition.

John Henderson		£423 0 0
William Geraghty		406 0 0
William Hughes (accepted) ..	£388 0 0	400 0 0
(Extras subsequently ordered) ..	12 0 0	

To Correspondents.

G. F. M. (Unavoidably postponed); J M'K, Glasgow (Fully in next No); J. B., Belfast (Previous notice accidentally omitted; that recently sent us now appears—thanks for favour); W. F. C. (Refer to present No.); W. T. M, Belfast (Thanks); J. B., Newry (Subscription to hand); R. P., Wexford (The party has a right to measure the curved portions as if square; a right admitted even in the matter of glazing, and, as a matter of course, the full dimensions, whether exposed or not); Received, R. H., Newbridge, with enclosure; J N., Dundalk (Thanks); F. M., Ballinasloe (Shall be glad to hear, as promised).

NOTICE.

Orders for Subscriptions to, and Advertisements for, THE DUBLIN BUILDER, *will be received at the Proprietors' Office,* 17, LOWER GARDINER-STREET. *Wholesale Agents*—GEORGE MASON, 24, *D'Olier-street; and* JOHN PLASTO, 144, *Upper Abbey-street;*

At CORK, *by the Agent, Mr. S. M. Peck,* 40, *South Mall; and all Booksellers.*

At BELFAST, *by the Agent, Mr. Francis Dowd,* 47, *Townsend-st.; and all Booksellers;*

At GALWAY, *by Mr. T. J. Connolly, and Mr. Wade, Booksellers.*
Yearly Subscription (payable in advance), 8s.; *per post,* 4s.

To Advertisers.

Special attention is respectfully directed to the advantages offered by "THE DUBLIN BUILDER" *as a medium for advertisements of a* certain *class. It is* simultaneously *circulated in* BELFAST, CORK, *and* GALWAY, *as well as* DUBLIN, *on the* 1st *of each month, and its list of patrons comprehends nearly all the principal* ARCHITECTS, CIVIL ENGINEERS, COUNTY SURVEYORS *and* BUILDERS *in Ireland; independent of a host of other parties, whose occupations or tastes are more or less identified with the purposes for which the Journal is being established.*

The heads of some eminent manufacturing firms, both in England and Scotland, have already recognised and adopted it, as a desirable medium, and doubtless their example will be followed by others. Without presuming to state that the extent *of its circulation can compare with some* old *established journals, we must, nevertheless, impress on you, that being a class periodical, it* at once *goes* directly *into the hands of those for whom certain advertisements are intended, and remains with them as a permanent record; unlike the evanescent character of some other journals, having a more promiscuous circulation.*

"THE DUBLIN BUILDER" *is also to be found at Public Reading-rooms, Libraries, Mechanics' Institutes, Clubs, Hotels, &c, &c. Approved blocks or stereotypes will be inserted in the advertisement pages.*

[*] *Atmos*, vapour; and *sphaira*, a sphere (Greek).

Miscellaneous.

THE ART-UNION OF IRELAND,

established under the auspices of the Irish Institution, according to Act of Parliament, on the system of MONEY PRIZES, with the right of selection in every case by the Prize-holder.

ANNUAL SUBSCRIPTION—ONE GUINEA.

One chance for every Guinea subscribed.

The Committee of Management for the first year consists of 81 Members of the Irish Institution.

President—The Earl of Charlemont. Trustees—Right Hon. Maziere Brady. Sergeant Berwick, Q C., and John Barton, Esq. Treasurers—The Bank of Ireland and its branches. Secretary—George F Mulvany, Esq., to whom all communications may be addressed, at the office of the Art Union of Ireland,

73, GRAFTON-STREET, Dublin.

Prospectuses sent free by post.

EARLY PAYMENTS FOR LIFE ASSURANCE VERY CONSIDERABLY REDUCED.

It frequently happens that Heads of Families would wish to make a larger provision for those dependent on them than they find they can afford to do when required at once on Assuring to pay the full Annual Premiums. To meet such cases, and to enable provident persons to procure Policies at the Low Premiums charged for Young Lives, the Directors of

THE PATRIOTIC ASSURANCE

COMPANY have resolved to charge, when required, *only One-half of the First Seven Years' Premiums* on Participating Policies, the other half being allowed to remain Unpaid at Interest as long as the Policy-holder pleases.

FIRST YEAR'S PAYMENTS FOR £500 POLICIES,
Allowing Participation in Profits.

Age 20.	Age 30.	Age 40.	Age 50.
£4 18 0	£6 1 0	£8 10 0	£11 13 6

Life Policies involve payments of large sums of money at distant periods, and it follows that by far the most important point to be ascertained by an intending assurer is, that real security will be afforded him. The element of security is all-important in assurance transactions, and yet 37 English Companies are winding up in the Court of Chancery, and 22 English Companies last year transferred their business.

The CAPITAL of the PATRIOTIC ASSURANCE COMPANY OF IRELAND is *ONE MILLION FIVE HUNDRED THOUSAND POUNDS*: complete security is thus afforded.

The Regulations of the Company are very liberal.

No charge is made for Entrance Money, Medical Fees, or Policy Stamps.

Thirty Days are allowed for Renewal of Life Policies, and the Assured are held protected during these Days of Grace.

LOANS are ADVANCED on Approved Personal Security, in connection with Life Policies, without Money Bond or Warrant being required.

PATRIOTIC ASSURANCE COMPANY,
FOUNDED 1824,
CAPITAL £1,500,000,
HEAD OFFICES, 9, COLLEGE GREEN, DUBLIN,
With Agencies in the Principal Towns in Ireland.
J. MONCRIEFF WILSON,
Secretary of the Company.

REDUCTION IN THE PRICE OF GAS.

—Notice is hereby Given that the Directors of the Alliance and Dublin Consumers' Gas Company have this day REDUCED the Price of Gas to FOUR SHILLINGS and NINEPENCE per Thousand Cubic Feet. By Order.

JOHN STEVENSON, *Secretary*.
114, Grafton-st., 1st Jan., 1859.

GAS FITTINGS. — The Alliance

and Consumers' Gas Company, expecting that the reduced price of Gas, added to its many other advantages, will produce a largely-increased consumption, and consequently involve the necessity of putting up additional Fittings, have made arrangements for meeting the requirement of the Public in both respects.

Their SHOW-ROOMS are amply stocked with the Newest Designs in CHANDELIERS, BRACKETS, HALL and LOBBY LIGHTS, &c.; and they specially invite an inspection of their GLASS LUSTRES, to the selection of which they have given particular attention.

114, GRAFTON-STREET.

To Architects, Engineers, Artists, and Amateurs.

WM. M'CLEARY WIGHTMAN,

PRINTSELLER & ARTISTS' COLORMAN,
22, *NASSAU-STREET.*

Has always on hand a large and varied Stock of Drawing Materials, Paper of different sizes, Colors, Brushes, Pencils, &c., which professional gentlemen and others will find adapted to their requirements, & moderate in price.

Artists' Warehouse and Photographic Gallery,
22, NASSAU-STREET.

Statuary, Marbles, Cements.

DUBLIN BRANCH OF THE

KILKENNY MARBLE WORKS.

The Proprietor of the long-established Marble Works at Kilkenny (A.D. 1693), has been induced to open a Branch of his Establishment at No 43, Grafton Street, Dublin; and begs to acquaint the Public that he has now on view a large assortment of Chimney-Pieces, Tables, Fonts, &c., &c., to which he invites special attention.

These articles are all manufactured by the aid of extensive Water-power and Patent Machinery, by which the polish and finish are superior to any other description of manufacture.

Also, for the convenience of purchasers, Grates of superior quality, to suit the Chimney-Pieces, will be supplied.

All kinds of Statuary Work executed. Designs for Altars, Monuments, Tombs, Figures, &c., &c. forwarded on the shortest notice. Orders will be received at No. 43, Grafton-street, or at the Works, Millmount, Kilkenny, addressed to the Proprietor,

A. COLLES.

ALEXANDER BALLANTINE,

Stone and Marble Works, Chimney-piece Warerooms, &c., 126, Upper Dorset-street (nearly opposite Granby-row), Importer of Caen Stone, Portland, and Freestone, Monuments, Tombs, Headstones, &c.; Geometrical Staircases and Flaggings executed on the shortest notice, and in a workmanlike manner.

Roman Cement.
Portland Cement,

Medina Cement,
Parian Cement,

Mastic Cement and Plaster of Paris,
Manufactured by

FRANCIS (BROTHERS) AND POTT,

NINE ELMS, LONDON,
And Sold at Greatly Reduced Prices, at the
NINE ELMS CEMENT STORES,
12, Talbot-Place
(Near the Custom House), Dublin.

WALTER CARROLL & SON, Plain

and Ornamental Stucco Plasterers 40 Camden Street, Dublin. A large quantity of Figures, Vases, Centre-pieces, &c., always on hands. Country commands strictly attended to Architectural Designs accurately executed on the shortest notice.

THOMAS CONNOLLY, Contractor,

Modeller, Plain and Ornamental Stucco Plasterer and Cement Worker, No. 2, Bessborough-parade, Rathmines.

T. C. having executed the Plastering of a great many Catholic Churches, also Noblemen's and Gentlemen's Mansions, in different parts of Ireland, is prepared to undertake and execute any orders he may be favoured with in the most artistic style of workmanship, with punctuality and despatch, on the most reasonable terms. Country orders particularly attended to. Estimates furnished free of expense. A large quantity of Scaffolding for hire.

P.S.—I am at present finishing the interior of St. James's Catholic Church, James's-street, in the richest style of Gothic architecture, to which I beg to refer as a specimen of my workmanship.

THOMAS CONNOLLY,
2, Bessborough-parade, Rathmines.

C. WILLIAM GIBLAN begs to call

the attention of Architects, Builders, &c., to work executed by him in the Roman Catholic Church, St. James's-street, wherein he executed, from miniature tracings, Groups of various Arch Mouldings, Cluster Columns, Bosses, Foliated Capitals, Cherubim Heads, &c., &c. He respectfully calls their attention to the Chancel Arch, originally a Four-centred or Elliptic Gothic, now a Two-centred or Pointed, corresponding with the large window (having to bracket it with timber to form it so), the Group of Mouldings round it, girth, 11 feet (all run together); such a size never before attempted in this kingdom with one mould; and that the remaining works done in the Nave are models taken from the above works, as *per extract from Specification*:—

"The 16 Opes of the Triforia Arcades, all of which are to be of the same form and dimensions as those of the Triforia, lately executed in the Chancel, the Moulded Jambs, the columns with the Bases and Foliage Capitals, and the Clustered Arch Mouldings of the 16 Clerestory Windows, and which, as well as the Works of the Triforia, are to be of the same form and dimensions respectively as those of the Chancel."

Extract from 4th page of Specification.

"The foliage Capitals on the Cluster Columns and the Single Shafts, sustaining the Rib Mouldings of the Groins both in the Nave and Side Aisles, to be executed in the *best description of well-prepared Stucco, such as that recently used* in the Stucco Work of the Church."

Plaster of Paris.
Roman Cement.
Portland Cement.
Patent Mastic Cement.

John's Patent Stucco Cement.
Keene's Patent Marble Cement.

Of the best quality, to be had of

SALMON RICE, AND CO.

3, ANGLESEA-STREET.

Also Crown, Sheet, and Plate Glass; Fire Bricks, Tiles, &c.; Painters' and Plasterers' Brushes.

Gypsum for Agricultural Purposes

Steam Mills and Manufactory—CROWN-ALLEY.
Established, A.D. 1780.

MARTIN'S PATENT FIREPROOF CEMENT

which obtained the PRIZE MEDAL at the Great Exhibition, 1851, admitted to be the Best Internal Cement in the Market, and which may be painted on with perfect safety within 20 hours after it is worked, may be obtained of all respectable dealers, or of the Manufacturer,

J. CUMBERLAND PART,
Nephew and Successor to Stevens & Son, 186, Drury-lane, London, and Derwent Mills, Derby.
Established upwards of 40 years

Sample Casks, containing One Hundredweight, will be forwarded on receipt of Post-office Order for 7s. 6d., payable at the Charing-cross Office, London.

Building Materials.

PLANING, SAWING, & MOULDING MILLS,

GREAT BRUNSWICK-STREET, DUBLIN,
(*Adjoining Terminus of Dublin and Wicklow Railway*).
MICHAEL MEADE,

HAVING recently completed the requisite Buildings for the reception of powerful Machinery for Sawing, Planing and Moulding Timber for Building purposes, will be glad to receive orders in this department, and shall execute all favours in the *best*, *cheapest*, and most *expeditious* manner.

M. M. has erected this machinery with a view of keeping the trade in Ireland, large quantities of ready prepared Carpenters' Work being imported from England, and he is prepared to compete with English and Scotch establishments in the execution of all kinds of Carpenters' Work.

TO BUILDERS.

THE IRISH ENGINEERING CO.

supply—

Wrought and Cast Iron Beams; Ornamental Iron Work for Balconies; Cast-iron Sashes.
Eaves, Gutters of all kinds.
Ridge and Crest Tiles, &c., &c.
Also, Plumbers' Castings and Range Work.

SEVILLE IRON WORKS, SEVILLE-PLACE,
DUBLIN.

SLATES, YORKSHIRE AND

CARLOW FLAGS, FLOORING TILES, &c., of the best description, and at lowest possible prices, at THOMAS BRETT'S Brick and Flag Offices, Broadstone, Portobello, and Baggot-street Bridge.

BUILDERS' GOODS, Kitchen Ranges,

Ironmongery, Window Glass, Oils, Paints, and Paper Hangings, of the best qualities, at MAURICE BROOKS', SACKVILLE-PLACE, DUBLIN.

THOMAS TICKELL'S TIMBER &

SLATE STORES,
193 & 194, NTH. KING-STREET (Corner Green-st.)

Importer of Fire-blocks, Bricks, Kiln, Oven, Floor, Ridge, and Pan Tiles, Bath Brick, Ridge and Sink Stones, Fire Clay, &c. Country Orders attended to.

TIMBER AND SLATE STORES,

SWIFT'S-ROW, Lower Ormond-quay
(*Near the Metal Bridge*).

Mahogany, Cedar, Rosewood, Walnut, Birch, American Ash, Pine, Deals, Staves, &c., &c. A large Stock of Staves on hands. Country Orders promptly attended to. GEORGE FINNEGAN.

KITCHEN RANGES, Drawingroom

Bright Grates, Fenders, Fire Irons, and all kinds of Builders' Ironmongery. MAURICE BROOKS, SACKVILLE-PLACE, Dublin.

SLATE, TILE, AND LATH STORES,

Nos. 17 & 34, POOLBEG-STREET. *Established upwards of a century.* The business of this establishment, carried on by the late Robert Lovely, will be continued under the firm of ROBERT LOVELY and SON. They respectfully solicit a continuance of that support from the public that has been heretofore so liberally given to this establishment, and trust, by maintaining the high character for integrity it has always enjoyed, to merit the approval of those who may favour them with their commands. A large and varied assortment to select from, at the fair marketable price of the day.

ROBERT LOVELY AND SON.

W. WARNE AND CO.

CALL the attention of Engineers and others to their PATENT MINERALIZED and VULCANIZED INDIA-RUBBER, in Sheets, and for Valves, Washers, Railway Buffers, Bearing Springs; Hose Pipes (delivery and suction), Flexible Tubings, Driving Belts, and to their improved Anglo-American FLEXIBLE CANVAS and INDIA-RUBBER PACKING, for Steam Joints and Piston Rods.

SOLE MANUFACTURERS OF THE
NEW PATENT MINERALIZED KAMPTULICON,
AND OF THE
MINERALIZED INDIA-RUBBER SOUNDLESS CARPET CLOTH,

Combining Extreme Flexibility, and consequent non-liability to cracking; Durability and Impermeability to Wet; is warmth to the feet and softness to the tread.

SOLE MANUFACTURERS OF
WARNE'S NEW PATENT MINERALIZED INDIA-RUBBER TUBULAR MATS.

These Mats consist of Tubes of India-Rubber, of various configurations, placed vertically in contact with each other, and are far more efficient than any other description of Mat. No amount of ordinary wear can sensibly affect them; they thoroughly clean the feet like a brush, and the dirt removed falling through the cells formed by the tubes, is not carried by the feet on to the floors and passages, which are consequently kept perfectly clean; and by removing the Mat, the accumulated dirt is easily swept away.

The Mats never clog, require no beating, and are readily cleansed by water. Unlike all other Mats, water in no way injures them, and it neither lodges on or is absorbed by them. Indestructible by damp or wet, these Mats, made to any shape, size, or thickness, are especially suitable for uncovered passages and out-of-door purposes.

The invention is peculiarly applicable for Mats for Baths, Closets, Conservatories, Green Houses, Laundries, Sculleries, Ships, Boats, Omnibusses, Cabs, Carriages, Steps, Counters, Churches, &c.; and for Scrubbing Brushes for Decks, and Wooden and Stone Floors.

All Mats are marked W. WARNE and CO., Patentees, London. Orders received at the London Warehouse, 9, GRESHAM-STREET WEST, E.C.; or direct at the Factory, TOTTENHAM N, MIDDLESEX.

Oils, Colours, Glass, &c.

CORNELIUS MANNIN'S *Cheap &* Genuine Drug, Oil, Color, & Varnish Warehouse,
2, GREAT BRUNSWICK-STREET,
(near D'Olier-street).

Stained Glass,

FLAT LEAD WINDOW, & PATENT METAL SASH MANUFACTORY,
107 & 108, MIDDLE ABBEY-STREET, DUBLIN.

M. & R. SILLERY beg to inform parties requiring the above that they can supply them at much *Lower prices* than other houses, and respectfully invite an inspection of their patterns.

ESTABLISHED UPWARDS OF HALF A CENTURY.

THE Cheapest House in Dublin for Room Papers, Window Glass, and Laminated Lead for Damp Walls, is J. O'LEARY'S, 1, TEMPLE-LANE, Dame-street.

ROOM PAPER, in great variety, at MAURICE BROOKS', Sackville-place, Dublin.

GLASS SHADES—Round, Oval, & Square—for Protecting Vases, Clocks, Statuettes, Artificial Flowers, Models, &c. The largest Stock in Ireland for intending purchasers to select from, and sold at manufacturers' tariff. Also a constant supply of Stands for same, polished, French inlaid, or gilt. Wholesale orders executed with despatch.

A liberal allowance to the Trade.

JOHN CARRICK, Glass and Cement Warehouse,
5, MARY'S-ABBEY.

DR. JOHN IRVINE WHITTY, LL.D., M.A.,
Surveyor & Valuer to the Landed Estates Court in Ireland,
And Agent to Her Majesty's Government for the Sale of the Ordnance Maps and Books of the United Kingdom, the Islands, and the Colonies,
CIVIL AND MINING ENGINEER, LAND AGENT, SURVEYOR, AND VALUER,
35, PARLIAMENT-ST., LONDON,
AND
15, HENRIETTA-STREET, DUBLIN.
(Next the Landed Estates Court.)

N.B.—Maps, Designs, &c., copied or lithographed. General Printing and Lithography executed.

Rentals of all the Properties for Sale in the Landed Estates Court can be seen, on application, at Dr. Whitty's offices, as above, both in London and Dublin. The entire Ordnance Survey of London, on the scale of five feet to one mile, consisting of 815 sheets, kept continually in Stock.

Auctions, Sales, &c.

AUCTION OF TIMBER AND DEALS.

JOHN MARTIN and SON will Offer by AUCTION, at their Stores, NORTH WALL, on the 7th inst.—

518	Hundred of	1st and 2nd Quebec and St. John's Spruce Deals.
54	Do.	1st and 2nd Ditto Pine Deals.
63	Do.	Norway Red Deals.
1,100	Pieces of	Crown Memel.
800	Do.	Second quality Ditto.
600	Do.	Red Pine.
1,000	Do.	White Pine.
60	Do.	Oak.
30	Do.	Ash.

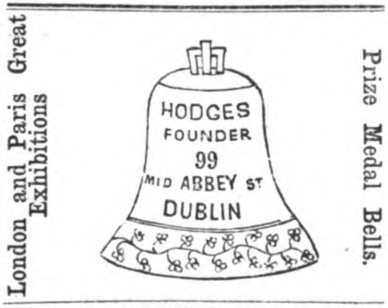
Sale to commence at One o'Clock.

Dublin, 12th March, 1859.

JAFFRAY BARCROFT, *Broker & Measurer.*

THEODOLITES, LEVELS, CIRCUMFERENTERS, Mathematical Drawing Instruments, Scales, Rules, Tapes, T Squares, &c.

JOHN ARCHBUTT, 20, Westminster Bridge Road, Lambeth, near Astley's Theatre, respectfully calls attention to his Stock of the above articles, manufactured by superior workmen. The prices will be found considerably lower than ever charged for articles of similar quality. An illustrated price list forwarded free on application. 8-inch Dumpy Level complete, 6 guineas; 10-inch ditto, 8 guineas; 14-inch ditto, 10 guineas; with compass, 1 guinea each extra. Best 5-inch Theodolite, divided on Silver, 18 guineas.



TO CORPORATE BODIES, TOWN COMMISSIONERS, AND THE PUBLIC.

RICHARD DOMIGAN, *Bass Broom, Cocoa Fibre, Mats and Matting, Straw Palliasse, Oilcloth, Sheet and Pipe Lead, and Curled Hair Manufacturer*, No. 72, MOUNTJOY-ST., Dublin.

⁂ Large Orders executed on moderate terms.

MINTON and CO.'S ENCAUSTIC and other PATENT TILES, for Churches, Entrance Halls, Conservatories, Balconies, &c.; Antique, Geometrical, and Alhambric Mosaics, manufactures of highly decorative character, and extreme durability, Slabs, and Tiles for Fire-places and Hearths, Coverings for Grates, Door Furniture, White Glazed and Ornamental Tiles for Baths, Dairies, and Kitchen Ranges, may be had in great variety at their Manufactory, Stoke-upon-Trent, Staffordshire.—Designs prepared and estimates given on application to A. J. ALDRICH, AGENT, 12, TALBOT-PLACE, DUBLIN.

TO CLERKS OF WORKS.

WANTED, immediately, a quiet, experienced CLERK OF WORKS, to superintend the erection of a large Building. Apply, stating qualifications and terms, to John Neville, C.E., Dundalk.
25th March, 1859.

WANTED, an active, intelligent Joiner or House Carpenter, who could devote a few evenings or spare hours a-week to the introduction of a first-class Work on House Carpentery among his fellow-workmen in the City of Dublin. No risk. Terms liberal. Apply to "Carpenter," office of this Paper, 17, Lower Gardiner-street.

EXPERIENCED CANVASSERS WANTED, on liberal Commission, for Advertisements and Subscriptions to "The Dublin Builder," now established on a permanent basis.

Special Agents wanted in London and the northern English Towns and Manufacturing Districts; Glasgow, Derry, Cork, Limerick, and Galway. Apply at the Office, and forward references.

It is the desire of the

WESTERN LIFE ASSURANCE SOCIETY OF LONDON (Established in 1842), to Lend Sums of from £50 to £500 on Personal Security, collateral with Assurance.

ARTHUR SCRATCHLEY, M.A., F.R.A.S., Sec.

JAMES WILSON RAMSAY, Solicitor, Agent, and Law Agent to the Dublin Trades Protection Society, 15, Bachelor's-walk, Dublin.

NOTICE OF REMOVAL.

JOHN QUIN, Builder, respectfully informs his friends and the public that he has removed from 136, Lower Gloucester-street to the more central and extensive Concerns, 63, Upper Stephen-st., where, in addition to his general business, he has made arrangements for carrying on a trade in Timber, Deals, Laths, Slates, Fire Bricks, Fire Clay, & Ridge Tiles, Chimney-tops, Plain and Fancy Tops, Sink Stones, Sewer Pipes, and every article for the Building Trade.

TO ARCHITECTS AND BUILDERS.

HENRY E. JAQUES Architectural Carver (late of Myres's, of London), begs to inform the above that he has commenced business at 36, Middle Gardiner-street; and having a thorough knowledge of Architectural Carving, he respectfully solicits their patronage.

N.B.—Plain and Fancy Block Letters on the shortest notice, and at the most moderate terms.

36, MIDDLE GARDINER-STREET.

FIRE BRICKS, of every description and size; Furnace Blocks, Flue Covers, Chimney Cans, Vent Linings, Gas Retorts, Sewerage and Water Pipes, Vases, Fountains; Balustrading; Fire Clay, ground and selected, manufactured at the Garnkirk Works, near Glasgow.

A large Stock always on hand, and for Sale by

WILLIAM D. HENDERSON,
Agent for Belfast.

Fire, Life, and Marine Insurance Office,
42, Waring-street.

The Dublin Builder.

Vol. I.—No. 5.

UNDEFINED FOUNDATIONS—ARCHITECT UMPIRES—PARTY WALLS, & UNIFORM MEASUREMENT.

TWO patent facts — suggestive of the anomalies which exist in architectural practice—had been earnestly and impressively submitted to the consideration of the profession, in the recently-circulated report of the Builders' Association, and in their special address to the architects of Ireland. At the time *we* commented on them,* though not so much *in extenso* as to preclude a recurrence, and we feel fully convinced that on *these*, as well as many other points, builders have much cause to be dissatisfied with their present position, and, may, with every justice, seek from architects a redress of their grievances. Let us again investigate what those are. A contractor is called on, either by public advertisement or otherwise, to tender for the erection of a certain work according to plans and specifications, &c., prepared by an architect, such plans and specifications being of course presumed to be sufficiently clear and comprehensive for any intelligent builder to frame his calculations upon, as to the probable profit derivable from the undertaking. The dimensions of the proposed structure, viz., lengths, breadths, and heights, are legibly marked on the drawings, as also are the qualities of material, scantling, of timbers, &c., &c., fully defined in the specification. So far so good! The estimate is made and adopted, and the fortunate (?) contractor commences his work; flattering himself that he is about to add another link to his chain of money-making enterprises. But—there is a *but* in everything—in excavating for his foundations he finds that the deeper he goes the softer becomes the stratum, his labourers are knee-deep in mud, and water pours in rapidly; he refers to his specification for instructions to guide him in this contingency, and there are *none!* but he learns *too late* the happy intelligence "*that the builder is bound to sink sufficiently deep to secure a good foundation, in the opinion of the architect.*" Visionary dreams of future bliss to be experienced while counting his little yellow gods, are now transformed into an unhappy reality of ruin staring him in the face. There is no retreat! our contractor and his "two solvent securities" are bound hand and foot, and the proprietor, like Shylock, *will* have his pound of flesh. An appeal to the architect is ineffectual, that worthy (*as most architects are*) professional significantly shakes his head, very much regrets the circumstance, but carefully insinuates a caution against *any bill of extras*. The contractor feels himself in a predicament, and refers to his quantities to ascertain the cubical contents of *proposed* excavation, and is awakened to the fact of their deficiency in a startling proportion to provide for the *requisite* work. Next come instructions to remedy the difficulty, and obtain a permanent *artificial* foundation; beds of concrete, timber platforms, piles, &c., &c., are talked of, and one or other ultimately adopted, to *the great edification and at the expense of the contractor*, who, if he succeed "in the opinion of the architect," experiences, by a peep into his emptied coffers, that "he has paid rather too dearly for his whistle."

Builders who make blind bargains possibly deserve to lose by their contracts; but as we believe that the architects of Ireland would not voluntarily do them an injustice, we are led to hope that since their attention has been thus directed to so important a point, they will not hesitate unanimously and promptly to yield to conviction, and expunge from their specifications a clause involving both themselves, their clients, and the builder in probable litigation, and inflicting a palpable injustice on the latter especially.

As regards architects proclaiming in their specifications that "in the event of any dispute arising between proprietor and builder, the decision of the architect must be final," it must only occur in a few isolated cases with junior practitioners, and is so irreconcileable with common sense, as scarcely to deserve *our* notice, much less that of the Builders' Association, every member of which is, doubtless, or ought to be, aware that such an assumption of position is illegal, unsustainable, and preposterous; and that an arbitration is not binding unless made a *rule of Court*, although acceded to in stamped documents, duly signed, sealed, and delivered, by all parties concerned. Such is the respect which the law of Great Britain demands for its administrators! For the credit of *all* members of that profession, therefore, to which, from association, our inclination naturally leans, we hope to find wanting the opportunity for further criticism on this point.

Subsequent to the publication of the report drawing attention to the above facts, another document, of a similar character and scarcely less interest, has appeared, and which may be seen in the advertising pages of this number. The builders seem to be in earnest in their mission, for we find that "several topics of importance have deeply engaged their attention;" amongst the rest, the undefined state of the law as regards "Party Walls," and the desirability of adopting a "uniform mode of measuring building works." In London, the Metropolitan Building Act, 18th and 19th Vic., is an elaborate and generally comprehensive document, though ambiguous—as nearly all acts of parliament are—admitting of variable construction, and giving rise to much misunderstanding and litigation; but in Ireland we have the alternative of choosing between "no act at all" or the probability of one equally ambiguous being granted to us. But "of the two evils *we* should choose the least," and unite with the Builders' Association in desiring *some* code of rules to be laid down, which would, even in a degree, set at rest the various difficulties presenting themselves in the erection of city dwellings and commercial houses.

Gentlemen of the long robe profit by this state of things no doubt, but it is materially detrimental to all connected with the building profession, as also to the community at large; for the more misunderstanding exists, the more litigation is sure to follow, the more expense and trouble heaped on all concerned, and the more dissatisfactory in every respect are the results.

"Uniformity of measurement" is, to our mind, "a consummation devoutly to be wished," and most probably would meet with the cordial approbation of architects and building surveyors, inasmuch as it would surely facilitate the preparation of estimates, settlement of builders' bills, &c., and to some extent obviate the enormous discrepancies which every day occur in the amounts of tenders for works, which can only be accounted for by the variety of systems adopted in taking out quantities, and which frustrates the intention of every honest contractor to undertake work at its *fair* value. Finding, however, that all these subjects are referred to committees of the Association, to frame a complete report thereon, we await that document prior to further observations, and conclude by awarding the energetic members of that body their full meed of praise for their laudable exertions in a progressive direction.

---

* See page 32.

THE ANCIENT CROSS OF BANAGHER, KING'S COUNTY.*

The old church of Banagher, King's County, was heretofore known by the appellation Kill-Regnaighe, and the parish in which its ruins exist is still called Reynagh. This parish was situate in the diocese of Clonmacnoise. The names just mentioned were given to both the church and the parish in consequence of St. Regnach, *alias* Regnacia, sister of St. Finian who resided at Clonard, having founded a religious house here, over which she was abbess. St. Regnacia in all probability died about the same time as her brother Finian, who went to rest A.D. 563. The ruins of the church of Kill-Regnaighe stand nearly in the centre of the town of Banagher (celebrated for its fairs). and the walled-in space which encompasses them is used as the parish cemetery

On a fine summer day, many years ago, loitering about the straggling, long, and unpicturesque street of Banagher, I happened to ramble into this church-yard, as well with a view to beguile time as for the purpose of examining any relics of antiquity which might there present themselves. The trouble of the visit was amply compensated; for I there found, prostrate on the earth, a stone, of which I send a sketch with this paper, showing it as *it then was*. In using the words "*it then was*" I do so emphatically, in order to contrast its *then* with its *present* condition; for the stone has since that time been sadly and wantonly damaged.

On first inspection it was evident to me that this remain of antiquity had served as the shaft of a once stately cross, of which the other component portions were no longer to be found. I made inqnriry as to what had become of the remainder of this highly sculptured remain; but my inquiries proved unsuccessful. The only information I could glean was that the stone then and there lying humbly prostrate had, in former and more propitious days, stood erect beside a crystal spring, which once sent forth its limpid waters in the old market-square adjoining the church-yard, but whose abundant source was very many years stopped up. No person could be found to tell me the meaning of the carving on the stone, or why or on what occasion it had been carved at all.

I will now describe what remains of this very interesting antique. It is formed out of that description of greyish-brown sand-stone, which, when recently taken from the quarry, is so very soft as almost to cut beneath the pressure of an ordinary knife; but which becomes of adamantine hardness after being some time exposed to the atmosphere. The sketch, which accompanies this paper, presents a representation of the front or principal face of what is extant of this cross-shaft, from the lower part of which a piece has been broken off. This stone is five feet long, by one foot two inches in breadth at top, and one foot four inches at bottom. The sculpture on it consists of three compartments. On the uppermost of these we find a lion passant, three-tailed or *guived*, as a herald would express it. A small hollow about the place of the lion's shoulder was abraded into the stone when I first saw it. This has since been greatly enlarged.

Beneath the lion I have mentioned, and on the same compartment with it, is the figure of a bishop on *horseback*, and bearing his pastoral staff as emblematical of his sacred office. The crosier is of that plain form which indicates antiquity.

In the second compartment is a beast of the deer kind, and which is proved by the character of its horns to be the red deer (*cervus elephas*); an animal now, I believe, nearly extinct in Ireland. The poor creature is portrayed as in great pain, its head being thrown up in an attitude of anguish and distress, whilst its off or right fore-leg is found to be entangled in something resembling a trap. When I first beheld this stone the deer was quite perfect; but it has been mutilated by reckless and savage hands since that day.

The lowest compartment consists of four naked and ill-proportioned male human figures arranged around the central point of the compartment after the manner of spokes in a wheel. Their legs are hooked together, and the left hand of each figure grasps the hair of the figure immediately preceding it. Their respective right hands hold the beard of the figure immediately in rere.

The sides of the stone are ornamented with an interlaced tracery, some of which resembles serpents. This tracery it would be difficult, if not wholly impossible, to describe in words. The character of it is that of similar ornaments found in various carvings on stone of the tenth, eleventh, twelfth, and thirteenth centuries.

The most remarkable object on the back of the stone is some sort of mythic combination shaped like an animal, with a nondescript head, but rudely resembling that of a hawk. The ears seem to be represented by the heads of two serpents, whose bodies are twined into trinodal and circular forms of curve. The serpent, I need scarcely observe, was at all times acknowledged an emblem in religious rites. I do not remember to have met with anything like to this, excepting the figure on the little brazen talisman from Hindostan which I forwarded for inspection of the members of our useful Society. A sketch of this compartment of the stone is at B on the plate

The stone, the subject of this communication, appears to have been part of a sepulchral or commemorative cross, set up at the Banagher well to record the death of bishop William O'Duffy, who was killed by a fall from his horse A.D. 1297. I read in the original English edition of Ware's "Bishops," published at Dublin, 1704 (p. 29, Bishops of Meath and Clonmacnoise)—"William O'Duffy, a Minorite, after two years vacancy, succeeded and was restored to the temporalities. October 6th, 1290. He was killed by a fall from his horse in 1297." Harris, in his edition of Ware's "Bishops," quotes the Patent Rolls of Edward I. to show that he was bishop of Clonmacnoise. Perpetuated on the stone now being written of, is the record of that fatal event, for on it is to be seen a *bishop on horseback*. He is without (it is worthy of remark) either stirrups or saddle. Above his lordship is the lion, the hieroglyphic of strength and power, and being emblematic of the bishop's authority and character before the unfortunate accident befel him. Next to this we find the red deer taken in a trap and writhing in mortal agony and distress. This is plainly symbolical of O'Duffy's name and melancholy fate. The Irish word pronounced nearly as if written Daveleei, or Duffy, signifies a red deer.

It is manifest that the trap in which the foot of the deer appears to be entrangled is merely intended to record the accident which deprived O'Duffy of life. The words of the Four Masters do not lead us to believe that his death was instantaneous, for they only say that he died *in consequence* of the fall from his horse.

As to the carving on the lowest compartment, I own that I can form no certain conjecture respecting its meaning I have met with the same sort of symbolic representation only once elsewhere, namely, on an exceedingly curious stone cover of a coffin in the ancient burial-ground at Kil-Corban, county of Galway. The four human figures are certainly typical, and may have been intended to remind the beholder of never-resting time, or of the succession of the four seasons of the year, ever going their mystic round in close communication, the one with the other,

> Thus to remain
> Amid the flux of many thousand years,
> That oft have swept the toiling race of men
> And all their laboured monuments away.

On this change of seasons the poet from whom I have just borrowed has also sublimely written—

> These, as they change, Almighty Father, these
> Are but the varied God.

It is very remarkable that Ware and the "Annals of the Four Masters" disagree as to the diocese of which this William O'Duffy was bishop, while both state that he died by a fall from a horse. The church of Kill-Regnaighe, near to which the cross now being written of stood, was in the ancient diocese of Clonmacnoise. The evidence of this interesting remain may prove of some value in deciding between these highly respectable antiquarian authorities.

After the lapse of some years from the time I first had the gratification to see the shaft of the Banagher cross, I discovered that it was going to destruction, owing to ill usage. I therefore obtained permission to have it removed from the reach of its brutal and Gothic foes. It is now once more standing erect and free from danger, in the enclosed gardens at the rere of my residence in Parsonstown. The true archæologist would of course prefer to have it preserved *in situ*. He, nevertheless, will probably join me in opinion that it is better it should be preserved anywhere rather than not be preserved at all.

The statue of Webster does not please the Boston people. The following squib from the *Transcript* expresses a very general feeling:—

Set High.—"It should be set higher, I suppose," remarked a gentleman to his friend, as they stood in front of the statue of Webster, by Powers. "Yes," was the reply of one of the contributors, "about five hundred miles."

---

* Communicated by Thomas L. Cooke, Esq. to the Kilkenny Archæological Society, and published in vol. ii. of the Transactions.

SANITARY CONSIDERATIONS.

SEWERAGE—NO. III.

IN our former papers on this subject we have, we believe, given sufficient evidence to demonstrate that the sewerage system of the present day cannot be justified.

Morally, it is indefensible; because nothing can justify the *rich* in sending forth filth from their habitations to contaminate the streams of which the poor must drink—in filling the air with the seeds of death, that the poor, with constitutions predisposed by want and suffering to receive and germinate the evil, may breathe of it and die; whilst they, the opulent, surrounded by comforts, guarded against the destroyer by luxuries and stimulants, may live, and yet, by their acts, inflict death upon those beneath them.

Legally, it is indefensible; because law is based on even-handed justice, and forbids all that is morally wrong.

And *in engineering principle* it is indefensible; because it does not and cannot accomplish what it professes.

These are simple realities that cannot be *disproved;* they may be denied, but no one can disprove them, and the day will come when the world will look back with the same wonder at the obstinate prejudices which uphold the system, as it does now on those which in former days killed its thousands in small-pox and fever, by denying to the sufferers the pure air of heaven, and impregnating the atmosphere of which they breathed with the poisoned exhalations from themselves. Then and now the system is the same—our foulest impurities are retained festering beneath and around us, till the atmosphere is filled with death-dealing emanations.

The question is, therefore, what is to be done *to save us from ourselves?*

Out of the hundreds of propositions submitted to the Metropolitan Commissioners of Sewers, it may be said that *three* have survived, and still have backers. Let us examine them—

The first is that of the original Board of Health, headed by the then Lord Morpeth, but led by Mr. Edwin Chadwick.

Its stated object was to carry off the house matter generally by means of earthenware pipes, termed "impermeable," formed and jointed on the common earthenware pipe principle, one partially fitting into another. These were to be laid through the streets, beneath the surface, like water pipes—all concentrating to some particular point, where the matter was to be lifted and carried away, or discharged into rivers or the sea, as the case might be; and every house was to be supplied so abundantly with water, that constant streams were to flow through the pipes, and thus, by "flushing," so called, they were to be kept at all times free and pure. Such was the *theory.*

The second is what has been termed *the "Leicester system,"* because it has been carried into effect there. It was advocated simultaneously by Mr. Dover and Mr. Wicksted, and put into practice at Leicester by the latter. It was simply to lift and collect into tanks the matter discharged from sewers *at their mouths*, either by means of buckets or Archimedian screws, and to intermix with it what has been termed "milk of lime," an admixture of lime and water, about the consistency of *whitewash.* By this means the solid matter became immediately precipitated, to be collected for manure, and the water was pumped out of the vats into the rivers in a comparatively pure state.

The third is what has been termed "the peat charcoal system," which was proposed by Mr. Jasper Rogers, C.E. The object was to intercept all the solids discharged from closets, either by means of filtering tanks placed in convenient situations immediately outside each house, or to receive the matter of one or more houses or streets by means of *close metal pipes* running from the closets—the solids being retained in the tanks by layers of peat charcoal, through which the water rises, and discharges itself into the general sewer in a *perfectly purified state,* that effect being produced by the anti-putrescent properties of the peat charcoal. By this arrangement, *all* the fertilizing value of the animal refuse would be obtained for manure, whilst the water reaching the sewers would be perfectly innoxious, and of no injury to rivers, the animal matter or excrement never being permitted to enter the sewers—thus preventing them being contaminated, as they now are.

It is necessary to analyze each of these propositions, but we cannot spare space in our present number for more than the plans of the Board of Health, carried into effect under the especial care and direction of Mr. Edwin Chadwick, then its leading member.

The principle endeavoured to be established was, that excretary matter discharged into a *highly-glazed* earthenware pipe would "slide" along by the aid of a plentiful supply of water, and that there would be no possibility of stoppage. This *theory* was so well established *in the minds of the Commissioners,* that a noble lord, one of the number, declared at the Sanitary Congress at Brussels, that the action was perfect, and so little change took place by decomposition or otherwise, that he actually read the words of "*a billet-doux,*" (which had been subjected to a rather unusual use for such productions) after it had traversed some miles of pipe.

It is not to be wondered that "the impermeable pipe and flushing system" should have become fashionable after this, particularly when the fact is also known that above sixty reports, made by engineers employed by the Board of Health, upon that number of towns requiring sanitary arrangements, all declared that the system was perfect. A most singular coincidence of opinion, and proving the power of a leading mind, acting on paid subordinate ones.

The consequence was, that glazed pipes and flushing were assumed to be the panacea in the sewerage system. The pipes were laid through many streets in London—one in particular, the entire of Longacre; also in many country towns, especially, to a great extent, in Manchester, only to be removed again.

But the Board determined to win the whole of England by storm, the base of their operations being at Croydon. They *took* the town, and commenced war immediately; for the first thing done was to knock down every privy—but three, that happily escaped—and on pain of heavy fines each housekeeper was obliged to erect a water-closet, and connect it with the "*impermeable pipes*" laid through the centre of the streets.

All, for a time, "went happily as a marriage bell," except as to certain inconveniences experienced by the inhabitants between the *knocking down* of the privies and the *laying down* of the pipes. But these were only temporary annoyances that should be submitted to for public good, and the Commissioners issued a report stating, that from thenceforth the health of the town would be so much improved, that the rate for the support of widows would be abolished —in fact, Croydon was to be the most salubrious place in the kingdom, and house property rose in value considerably. Based on the elaborate and scientific reports issued from the Board, nothing could be more clear than that Croydon would be the pattern for the whole of England.

But, alas! "a change came over the spirit of the dream." First, the pipes began to choke in sundry places; but Mr. Chadwick declared it was solely because the nurserymaids crammed "empty bottles" and "hearth-brushes" into them, and they were denounced as recusants to sanitary reform. Next, detestable smells came back into the houses even from the pipes that carried off the *billet doux* in all its purity; but it was insisted, that upon *Board of Health principle*, there could not be any smell from "a glazed earthenware pipe," and that, therefore, there was no smell. Next, the children took sick, and scarletina came; but that was nothing—children were sick everywhere, and the scarletina was to be found everywhere.

Next came cholera, and at last a slow, wasting fever, that spread itself from end to end of the town, and visited every house, more or less, *where the privies were knocked down* and the pipes introduced; leaving the *three* houses where the privies remained *without any of the inmates being attacked*. In fact, the town was undermined with decomposing filth, the noxious emanations from which were held within the pipes, and from them drawn back into the houses by the action of the higher temperature within them. The pipes could not carry off the matter because of their imperfect arrangement and want of ventilation; after a short time they *rotted* in the ground, and collapsed, and the boasted *glazing* was proved to be a thorough fallacy—for the action of the acids of the matter destroyed it, and, eating into the material, destroyed that also.

Then raged one of the most fearful fevers that has been recorded for many years—"*the Croydon fever*," a low type of malignant infection, produced by the poison drawn back into every house by "the impermeable pipe system," introduced to do away with the evil of privies. It had not been seen by *the Board of Health* that the privy gave its noxiousness to the open atmosphere, whilst the "impermeable pipe" gave it back into the house, mayhap into the nursery, to discharge its poison upon the scarcely-formed lungs of childhood or of infancy, and snap the half-made thread of life—or manhood breathed it during sleep, to generate the seeds of fever and of death. Those who were to be the protectors of life, destroyed it; and, perhaps, a more discreditable description of facts could scarcely be read than the report to Government of Dr. Arnott and Mr. Page (the well-known engineer to the Woods and Forests), two men whose eminence rests as much on their virtues as their science—and which gives in detail the results of as fallacious a system as ever was introduced, ending in as deplorable a list of sickness and death as could well be described.

Up to the outbreak of the Croydon fever, report upon report was issued by the Board of Health, laudatory of every step taken; speeches were made by Mr. Chadwick to no end, in glowing description of results that never came; but death came, and some one has said—"The Board of Health slew its hundreds at Croydon *by Sampson's weapon*." We have only to hope that the same infliction may not reach us here; but we must close for the present.

COST OF CEILING-PAINTING.

Sir Peter Paul Rubens received for his painting of the grand *Plafond*, at the Banqueting House, Whitehall, the sum of £40,00. The space covered by this painting is about 400 yards, so that he was paid nearly £10 per yard. Sir James Thornhill, the first Englishman who received knighthood for his ability in art, was paid only £3 a yard for the laborious work on the ceiling of Greenwich Hospital, and only £1 a yard for painting the ornaments on the walls. This employment he was appointed to in the reign of Queen Anne; but the work was not completed until the reign of King George I. He commenced in 1708, and finished in 1727, and was paid altogether £6,685.

The valuation of the work, after many attempts to screw down the painter, was made by the directors of the hospital, after consulting the following artists then residing in London:—Vandervelt, Cooper, Richardson, Sykes, and Degard, who decided in favour of Sir James, and reported that the performance was equal to anything of the kind in England, and superior in the number of figures and ornaments.

"The Duke of Montague," says Sir James Thornhill, in his memorial to the commissioners for building the hospital, "paid Monsieur Rosso for his saloon, £2,000, and kept an extraordinary table for him, his friends, and servants, for two years, while the work was doing, at an expense estimated at £500 per annum."

Signor Verrio was paid for the whole palaces of Windsor and Hampton Court ceilings, sides, and back stairs at 8s. a foot, which is £3 12s. a yard, exclusive of gilding, had wine daily allowed to him, lodgings in the palaces, and when his eyesight failed him, a pension of £200 per annum, and an allowance of wine for life.

Signor Rizi had of the Duke of Bedford £1,000 for painting three rooms; for the little chapel at Bulstrode, £600; from Lord Burlington, for his staircase, £700; Signor Pellegrini, of the Duke of Portland, for work in his house, £800, and for a small picture over a chimney-piece, £50; of the Earl of Burlington, for the sides of his hall, £200.

Other instances might be given to show the large amount of employment this now comparatively unused description of house-decoration afforded to artists of ability.—*The Builder*.

INTERESTING SCULPTURAL RELIC.

STATUE OF THE BLESSED VIRGIN, IN DUBLIN.

There is preserved in the Carmelite Church, Whitefriar-street, Dublin, a very interesting sample of ancient sculpture—a statue of the Virgin, with the infant Jesus in her arms, the size of life, carved in Irish oak. The style of this most curious monument is dry and Gothic; yet it has considerable merit. There are some circumstances relative to the preservation of this statue, preserved by tradition, which may probably interest the reader. It was originally the distinguished ornament of St. Mary's Abbey, at the north side of Dublin, where it was an object of admiration (See "Archdall's Monasticon"). Its glory, however, was but of short duration. The noble abbey to which it appertained was given to the Earl of Ormond, for stables for his train, and the beautiful statue was condemned and, as it was supposed, consigned to the flames. One-halt of it was actually burnt by the common hangman, but it was that moiety which, when placed in a niche, is not much missed: the other part was carried by a devout person to a neighbouring inn-yard, where, with its face buried in the ground, and the hollow trunk appearing uppermost, it was appropriated, for concealment and safety, to the ignoble purpose of a hog-trough! In this situation it remained until the furious rage of the iconoclasts had passed away, when it was restored to its original use in the humble chapel of St. Michan's parish (Mary's-lane), which had grown up from the ruins of the great monastery to which the statue had originally belonged. But during the long night of its slumber in obscurity, a great change had taken place in the spirit of the times, more dangerous to its safety than the abhorrence of its iconoclastic enemies. No longer an object of admiration to any, except the curious antiquary, it was considered of little value by its owners. Within the last few years, the ancient silver crown which adorned the virgin's head was sold for its intrinsic value, as old plate, and melted down;[*] and the statue itself would most probably have followed the fate of its coronet, had it not been rescued for a trifling sum by the prior of the convent (Very Rev. John Spratt) in which it is at present deposited. The statue now stands at the epistle side of the high altar.

---

[*] This crown is very generally supposed to have been the indentical one used at the coronation of Lambert Simnel, in Christ Church, Dublin.

INSTITUTION OF CIVIL ENGINEERS.

AN ordinary general meeting of this institution was held at Sackville-street, on Tuesday the 12th ult. Mr. M. B. Mullins, President, in the chair. After the reading of the previous minutes, the Secretary announced the receipt, from Professor Hennesy, F.R.S., of his pamphlet on a uniform system of weights, measures, and coins of all nations; and from the proprietor of the *Civil Engineers and Architects' Journal*, the numbers of that periodical for the current year. Thanks were voted therefor. The paper for the evening—On a new method of shoreing adopted in removing the two lower stories of the Royal Bank, Foster-place, Dublin — was read by Mr. William Anderson, associate. The paper commenced by a statement that about a year ago the directors of the Royal Bank, finding it necessary to construct a more extensive cash office to meet the requirements of their increasing business, invited several architects to lay suggestions before them as to the best means of accomplishing their object, and finally adopted the plan of Mr. Charles Geoghegan, of Great Brunswick-street, whose design was to make one large and lofty room stretching from Foster-place, to Anglesea-street, by throwing a circular-framed roof, with lunette panels for light over the courtyard between the houses and the streets abovenamed, and removing the first and second floor-walls of the building in Foster-place, supporting the upper portion on beams and columns. By these means a room 81 feet long and 56 feet wide has been obtained, affording 120 feet of counter frontage. Mr. Anderson proceeded to point out the great risk and difficulty of shoreing up, in the ordinary manner, walls weighing together upwards of 200 tons at an elevation of 40 feet from the basement, and to explain Mr. Geoghegan's invention, by means of which the operation was performed with perfect ease and safety. The plan consisted in breaking holes at intervals through the walls to be removed, at a level the beams were intended to occupy; and inserting iron frames on which the weight of the walls was wedged and carried, while the portion of masonry between the frames was removed, and the beams put into their places through the supporting frames. By this method the wall which was to be removed, formed a temporary pillar to support the other part which was to be retained. As soon as the beams were adjusted and fixed to each other and to the four supporting columns, the weight of the walls was made to rest on them, and the frames, which could be taken to pieces, were removed. One of the frames, calculated to carry twenty tons, and which had actually been used in the Royal Bank, was exhibited in the lecture-room, showing how simple in construction and portable it was. The cost of shoreing eight walls upon this system was 62*l*, while builders' estimates amounted to from 168*l* to 180*l*, without including any charge for the great risk of attempting it at all. The shoreing in the manner described could have been done for 42*l*, had not the urgent necessity for completing the work as quickly as possible induced the contractor to procure more frames than were absolutely necessary.—The beams, which were all wrought iron, were constructed by Messrs. Courtney and Stephens, of Dublin, and were tested before leaving the works to the full load they were intended to carry, the deflections in no case exceeding three eighths of an inch. The four columns supporting the walls, which were of the unusual length of twenty-six feet, were minutely described, particularly as to the precaution adopted to insure perfection of manufacture, the author pointing out that though the strength of the perfect column might be ample, there existed so many causes of imperfection that it behoved the engineer to use his utmost skill and caution to insure soundness, especially when the diameter was small for the height. In conclusion, the directors were applauded for their discernment and liberality in placing full confidence in the architect, and encouraging him in the application of a new principle which has turned out so much to the public advantage. The zeal and intelligence of Messrs. Crowe and Sons, the contractors, were also commended as having contributed very materially to the success of the undertaking.—The paper was illustrated by numerous coloured diagrams and models. The discussion which ensued showed the concurrence of the members in the excellence of Mr. Geoghegan's new system of shoreing, and the great variety of cases to which it could be applied.

A gentleman of Philadelphia has effected what appears to be a valuable improvement in the signal light for steamboats. The improvement consists in a simple mechanical arrangement by means of a post, moveable arm or bracket, connecting with the main shaft of the engine, by which, at every revolution of the paddle-wheel, the lights placed upon the extremity of the arm will revolve and show distinct colours. The lights are placed directly over the wheel-house, and are entirely within the control of the pilot, either by congearing or by belts. Several modifications of the machinery may be made, so as to apply conveniently to paddle-wheel steamboats or to propellers. The machinery is not costly, and seems well adapted by its simplicity and efficiency, to prevent collisions upon the water.—*Scientific American.*

AN AMERICAN SKETCH OF LONDON.

LONDON, the metropolis of Great Britain, is situated on the river Thames, 45 miles above its mouth. Its origin is lost in the mists of antiquity. The first mention of it is found in the annals of Tacitus, who speaks of it as a colony not particularly extensive, but celebrated for the great number of merchants and traders who congregated in it. At the time of the Roman invasion, it became a prefecture, and was subject entirely to the Roman laws. The Britons revolted A.D. 61, and captured and sacked the city. It was soon rebuilt, and early in the fourth century was enclosed by walls. After the Saxon conquest, London became the capital of the kingdom, and the venerable Bede speaks of it as a "princely commercial city." In the middle of the twelfth century, the population of London was about 40,000.

The city seems to have increased steadily in population and wealth, from the middle ages up to the beginning of the present century. The severest reverses which it has ever experienced, were the plague which prevailed in 1665, and carried off more than a quarter part of the whole population (and whose ravages have been so graphically described by Defoe), and the great fire which occurred in the following year, and destroyed nearly nine-tenths of the city within the walls. The loss by this fire amounted to upwards of 50,000,000 of dollars. The calamity (like many other similar events) proved to be a great public benefit; for the city was rebuilt on a grander scale, and the genius of Sir Christopher Wren, and the other great architects of that age, made it a rival of the old capitals of the continent of Europe.

The city soon outgrew its walls, and has steadily gone on increasing to the present time. It now comprises Westminster, and several adjoining boroughs and suburbs; and some idea of its extent may be formed from the fact, that while the city proper only contains 725 acres, the metropolis embraces an area of more than 78,000 acres. It is computed to be about ten miles in length, and six in breadth. Its increase has been remarkably rapid within the present century, at the commencement of which, its population amounted to considerably less than a million. At the present time the number of inhabitants cannot be much below three millions, and this affords but a poor idea of the numbers that actually belong to London, though they reside at a distance of some miles from it, the communication between it and the neighbouring towns is so rapid.

One of the most remarkable features of London is its bridges. They are nine in number, and have been built within little more than a century, at a cost of upwards of 12,000,000 of dollars. The shops of London are generally extensive, and some of them are quite handsome, but they are not to be compared with those of Paris, and some of the other continental cities. The bank of England was founded in 1694. Its operations are carried on by a corps of about 800 clerks.

Although London owes its chief importance to its foreign trade, it still has manufacturing interests, which give employment to thousands of people. Its breweries are on a very extensive scale, and immense quantities of porter and ale are exported to every quarter of the globe. In the manufacture of carriages, clocks, watches, all kinds of instruments, jewellery, gold and silver plate, &c., London has a very high reputation. The manufacture of silk employs nearly twenty thousand persons.

The docks of London occupy many acres. With their warehouses they afford the best criterion on which to form a judgment concerning the commerce of the metropolis. The West India docks are some fifty acres in extent, and cost more than 7,000,000 of dollars. The London docks are more than 25 acres in extent, and their warehouses are among the wonders of the capital. The tobacco warehouse is the largest building of the kind in the world. It occupies five acres, and affords storage for 25,000 hogsheads of tobacco, while the vaults underneath are large enough to contain more than 20,000 pipes of wine. The West India docks, with their yards and warehouses, cover nearly 300 acres. The Victoria docks which were completed in 1855, cover more than 70 acres, and occupy 200, including their warehouses, &c. These docks have a sufficient depth of water to accommodate the largest ships.

Some idea of the commerce of London may be obtained from the consideration of the fact, that more than 2,500 sailing vessels (695,000 tons) and about 570 steamers (168,000 tons) are registered as belonging to that port. The average of the arrivals from foreign ports for several years past has been between ten and eleven thousand of 2,500,000 tons, and about 20,000 coasters, amounting to nearly 3,000,000 of tons. An immense business is done in coal. In addition to the great quantities of coal brought from the northern part of the island by railway, the vessels laden with coal entered at the port of London have amounted to nearly 12,000 in number yearly, for some time past. In the year 1856, the British and Irish manufactures, and produce exported from London amounted to nearly 130,000,000 of dollars. In the same year, the duties collected on foreign imports in the London custom-house amounted to considerably more than 60,000,000 of dollars.—*Boston Pilot.*

MONKSTOWN HOUSE, COUNTY DUBLIN.

PERHAPS one of the most important domestic edifices recently erected in the suburbs of this city, is the mansion now nearly completed for William Harvey Pim, Esq. (one of the well-known fraternity of merchant princes bearing that surname) in the beautiful and rising locality of Monkstown. It is a large block of building about 90 feet by 64 feet externally, and in style of architecture is a composition of Italian and Byzantine, the latter being more predominant in the massive square tower rising about 90 feet high at the south-east angle, than in the main structure. The approach to the demesne is through a handsome gateway with a new and spacious lodge at one side, which, both in point of design and execution, presents many noteworthy features. The house stands on a slightly-raised ground, and displays on the entrance elevation two projecting wings with large bows, in which are three handsome windows, each sash glazed with plate glass, and weighing 112 lbs., surmounted by pediments, and connected by a recessed centre in which is placed an Ionic *distyle in Antis* portico. A spacious flight of granite steps—some of the stones being 16 feet in length—from Ballynockin quarry, and a landing of similar material, 20 feet by 11 feet, in large cubical blocks, leads to this portico. Thence is the approach to the entrance-hall, which with the other internal arrangements we shall hereafter describe. The northern flank presents an unbroken line, and a corresponding bow at rere to that on front preserves uniformity on profile. This elevation is peculiarly effective, and the vermiculated ashlering and other decorations round the windows display a pleasing boldness of treatment, and contribute materially to the *toute ensemble.* On the opposite or southern flank a handsome conservatory of apsidal form, and 28 feet by 24 feet, is introduced, and in connection with same is a vestibule with semicircular glass roof and end, forming entrance to the grounds, as well as therefrom, through an ante-room, to the tower above alluded to. Internally, the tower is 12 feet square, and divided into four compartments in height, with moulded window-jambs and heads, a bold projecting corbel course. open stonework parapet, and a lead flat from which is obtainable a magnificent view of the bay and surrounding country for many miles. The tower is built of punched irregular-jointed Dalkey granite ashler, familiarly termed "hough and ham," and the quoins, dressings, &c., of chiselled Ballynockin granite, whereby a pleasing contrast of color is produced. On north-east, and portion of west elevations, wide areas with strong retaining walls and bold granite breastwork, are continued. Portland cement has been used for the external decorative portions. and compo for the surface of walling on all the storeys.

The entrance-hall and staircase occupy the entire depth of the building from front to rere, and one-third the breadth of the entire. The hall is divided into three bays, by two pair of beautifully executed Corinthian columns in Caen cement, with elaborately decorated coffered ceilings; the staircase forming the third, and consisting of a central flight and two side do. of Portland stone with scroll castings, Riga oak handrail, and a circular lantern rising above from a highly enriched ceiling. To the left of entrance-hall are the drawing-room, ante, and dining rooms, all communicating by sliding doors, and forming a suite of apartments nearly 90 feet in length by 19 feet in width, with bowed terminations. The plaster enrichments, and imitation basketwork pendents in these apartments, as well as throughout the building, are faultlessly executed, and reflect the highest credit on the contractors for the cement and plastering, viz., Messrs. Hogan and Son, of Great Brunswick-street. The same observation is specially applicable to the painting and graining. To the right of hall is the library, communicating by moveable windows with the conservatory; also, a back stairs and some minor apartments, and we should not omit to mention a cleverly-arranged butler's stairs, concealed under and running parallel with first flight of principal staircase, communicating between the dining-room and culinary offices. On the upper floor are 5 bed-rooms, with several dressing and ante-rooms, bath, w. c., &c., and in the basement are all the requisite apartments for the complete carrying out of domestic arrangements on a large scale, comprising a splendid kitchen, scullery, larder, drying-room, male and female servants' bed-rooms, housekeeper's store, servants' hall, &c., &c.

The architects are Messrs. Carmichael and Jones; the builders, Messrs. Roberts and Sons; Mr. William Dockrell, clerk of works; Messrs. Hogan and Sons, contractors for plastering and cement work; Mr. Thornton, the painting; Messrs. Ross and Murray, the plumbing; and Messrs. Hodges and Sons, the iron-work; of all of whom, in their respective departments, we feel pleasure in making honorable mention.

THE LAKELANDS OF TERENURE.

FOR some years past a project has been in embryo for the laying out in building sites, esplanades, &c., that portion of Terenure familiarly known as "Bourne's demesne," but circumstances prevented its being matured up to the present time. On the occasion, however, of a recent visit to the establishment of Messrs. Day and Son, of London, the eminent lithographers, we noticed that a beautifully-executed view of a design for this project had been prepared by that firm according to plans furnished by a London architect (we believe), Mr. Beck.

Perhaps in the immediate vicinity of Dublin there is not any locality offering more favorable opportunities than this for such a purpose and for the display of artistic taste, combining, as it does, facility of approach from the metropolis, convenient proximity thereto, and a variety of beautiful scenery, to which an expansive lake, undulating slopes, and shady groves lend their charms. The architect, unlike many designers now-a-days, seems to understand the ground with which he has to deal, and to appreciate the beauties of the *locale*; for by a judicious combination of taste and artificial arrangement with natural advantages, he has succeeded in producing a design which, if carried out (and we sincerely hope it may), will result in an important adjunct to our suburban beauties.

The houses are chiefly arranged in terraces, but we doubt not that various classes will be provided; and we may mention, as a striking feature in the design, that conservatories occupy the positions of the roofs so as to answer a double purpose, though *we* find some difficulty in reconciling this arrangement as desirable either on account of health or convenience.

ENGINEERING AND BUILDING APPLIANCES AT THE AGRICULTURAL SHOW, ROYAL DUBLIN SOCIETY.

AMONGST the variety of mechanical inventions and designs exhibited at the recent Agricultural Show on the premises of the Royal Dublin Society, those hereafter particularized, and which come within our province more peculiarly to treat of, were specially noteworthy.

Steam-engines, portable and otherwise, and from two-horse power upwards, were exhibited by Mr. James Haywood, jun., of Derby; Messrs. Barrett, Exall and Andrews, of Reading, Berks, who are also patentees of a circular band saw to which a silver medal was awarded by the Royal Agricultural Society of England in 1856; Messrs. Brown and May, of Devizes, also inventors of an improved patent sluice cock; and Messrs. Smith and Ashby of Stamford, &c. &c. Several beautifully-executed designs for entrance-gates, and other iron work, including stable fittings, wrought-iron fencing, &c., were contributed by Messrs. Hennlewiez and Co., Glasgow and London; Messrs. Thomas Perry and Son, of Bilston, Staffordshire; A. Mac Donald, Belfast; and Mr. James Banks, of Derby-square, Liverpool. The patent machines for morticing, tenoning and boring hard or soft woods, as exhibited by Messrs. Gallon and Bean and Green and Jackson, of Leeds, attracted much attention; and as they effect a considerable economy of labour in the preparation of carpentry work for doors, sashes, &c., are worthy of general adoption, and must ultimately repay one hundred-fold the first outlay, which is but £15 or £16.

Local engineers and manufacturers made a very respectable appearance at the show, and amongst them we may notice Messrs. Turner and Gibson, of Hammersmith and Oxmantown foundries, who, with other inventions, exhibited a model of a "new patent balance rolling bridge," already commented on in the DUBLIN BUILDER, p. 41; Messrs. Edmundson and Co., the eminent hardware merchants; Mr. Wm. Daniel, gas engineer and ironmonger, who has erected several of his improved portable gas-works in the provinces; Mr. John Maguire, of Dawson-street, ironmonger, &c., to the Royal Dublin Society, and agent for Gurney's patent stoves, noticed fully in another portion of this journal, now used at the houses of parliament, St. Paul's cathedral, and several other public and private edifices in the united kingdom. It is highly gratifying to find English and Scotch engineers and manufacturers of eminence combating national prejudice, and exhibiting a desire to be on more intimate business terms with this country than hitherto.

M'KINNELL'S PATENT VENTILATING APPARATUS.

ANY innovation upon the old-established and recognized principle of supplying fresh air and withdrawing foul from apartments by means of orifices placed diametrically opposite, must at once excite a certain amount of surprise amongst the curious, and doubt amongst the sceptical; but those who have not seen or heard of the new Patent Ventilating Apparatus by Mr. M'Kinnell, of Glasgow, will accuse us of promulgating as *un fait accompli*, an absurdity and an impossibility, when we tell them, that by his invention, fresh air *is* supplied, and foul *is* withdrawn, from a dwelling by the *same* apparatus, occupying a space averaging some 12 inches square, and placed vertically in the ceiling of an apartment on any floor of a building. Ventilation theorists, startle not, reserve your scepticism, and hear the principle!

"To ventilate an apartment in the upper story of a house, a tube of zinc or other suitable material, is fixed in the ceiling, with a centre ornament attached. Inside this tube, and concentric with it, is placed a smaller tube. These communicate with the external atmosphere at different levels, the vitiated air rising up the central tube and passing off at the higher level; while the fresh air enters the annular passage, between the inner and outer tubes, at the lower level, and descends into the apartment below. Both passages are defended from rain, soot, &c., by perforated zinc or wire gauze, and provided with suitable valvular mechanism for regulating the currents—that of the outer passage, in the form of a projecting flange—serving to deflect the downward current of fresh air, and spread it out horizontally, so as to render its action imperceptible, while the ascending current may be regulated by a simple throttle valve. These valves are acted upon by cords passed over pulleys, and taken to any convenient point."

"Lower apartments are ventilated by similar arrangement, except that the fresh air enters the annular space horizontally and the vitiated air is discharged by an opening which is connected with the centre tube of the Ventilator. The horizontal part of tubes may embrace any portion or the whole of the space between two joists and the floor and ceiling, except so much as may be necessary for deafening. The vertical portions may consist of flues in the walls. Various modifications are made to adapt this invention to different buildings; as well as to ships, railway and private carriages, &c."

"Experience is better than theory," so to satisfy ourselves of the practical efficiency of the apparatus, we visited Ship-street Barracks in this city—an establishment displaying much need for sanitary appliances—and in one portion of which, House H, Nos. 3 and 8, this Ventilating Apparatus has been adopted. We happened to step in as the men were at mess in the barrack-room, where some twenty of them sleep likewise—a custom that, for the sake of health, not to speak of civilization, ought to be discountenanced—and found the atmosphere of the room quite free from the density that might be expected at such a time. In conversing with some of the veterans as to the action of the apparatus, and its ventilating value, they unanimously testified to its efficiency, and one Scotchman, perhaps "hardier" than the rest, exclaimed, in genuine Caledonian dialect, that "in the mornings their *moothes* (mouths) were now clean at any rate,"—a fact sufficiently significant that the invention is efficacious in withdrawing the vitiated air from a sleeping apartment, and preserving an equal temperature therein. Not so had it been previously, when the room was close, and a confined, heavy smell experienced after the night necessitating the immediate opening of the windows. We wish the invention success and general adoption, because *we think it entitled to it.*

SHOP ARCHITECTURE IN DUBLIN.

SHOP architecture, as it is familiarly termed, is much improving in Dublin, and some important works are being, or about to be, executed. Messrs. Pim, Brothers, are newly fronting their "monster house," in South Great George's-street, and in an elaborate style.* Other improvements are being made close by. In Grafton-street, the old dilapidated dwellings, of some centuries old, are gradually giving way to modern structures, and we doubt not but the gap caused by the recent fall of the house as noticed in the *Builder* will soon be filled by a more worthy occupant. A rumour was circulated some time since, of the probable pulling down of the block of houses uniting College-green with Grafton-street, with a view of widening the thoroughfare; but, as the work of "building up" is progressing there, we presume the project is abandoned. The new establishment for the Commercial-hall Company will be an important structure, having two fronts of Italian character, one (the principal) in Grafton-street, and another in Wicklow-street. Mr. Rawson Carroll is the successful architect, in a limited competition.—*Correspondent of "the Builder."*

A WORD TO YOUNG ARCHITECTS—COMPETITIONS!

WAS there ever a more perverted word?—competition there is none. Truly in nine cases out of ten, it is palpably exemplified that "the race is not always to the swift," nor "the victory to the strong," and modest merit is permitted to remain in the shade, while influence, backed by ability *or not*, potently carries the sway. Young architects, enthusiastic in the pursuit of their profession, and desirous to distinguish, perhaps immortalize themselves, by obtaining an important work offering a favorable opportunity, speedily snatch at competitions as the means, but soon find that such *generally* are mere will-o'-the-wisp phantoms, fading with the effort, and leaving the pursuer to meditate on his fruitless exertion. Avoid competitions on principle; too often good is transformed into evil, and though the system decidedly possesses the element—if *honestly developed and matured*—for the advancement of young aspirants to fame, yet it opens a tempting path to unprincipled persons to avail themselves of talented assistance and a variety of ideas, at the mental, manual, and not unfrequently pecuniary expense of the duped authors. LYNX.

BUILDING PROGRESS IN BELFAST.

ON the old Lodge Road a whole street of houses has lately been erected for the humbler classes, many of whom are now obliged to live in unsanitary lanes and courts, but who have the good sense to remove to clean and airy situations, as soon as houses adapted to their means are built in such places. A new street, from Durham-street to Murray's-terrace, has now been filled up with houses of a more respectable class; and as the rere of those on the north side, the property of Mr. Brannigan, abut on the Institution wall, they will have the advantage of the free air from the grounds in all time coming. On the Crumlin-road, Eglinton-street, and Lonsdale-street about 50 new houses of a still more superior class have lately been erected. Mr. Gaffikin is building seven new houses nearly opposite the Queen's College, superior, perhaps, to any hitherto erected as street dwellings, in a style of architecture seldom adopted in streets, but in harmony with the Queen's College in front, and the Institution for the Deaf and Dumb in rere. The houses are also constructed of similar materials—brick with stone dressings; and Mr. Connor, the builder, appears to be carrying out the views of the architect, Mr. Jackson, with his usual ability. It is to be regretted that the site did not admit of their being built parallel to the street. The plan adopted is, however, far preferable to that of erecting a house with acute or oblique angles, which must have been the case had the line of streets been followed in the building. Mr. Hughes is erecting 14 houses at Mount Charles, in the same quarter. The houses are not large, and the ground on which they stand is a little too confined for our notion of how towns should be built, but the proprietor appears to be sparing no expense to render them durable and elegant dwellings for those whose aspirations do not go beyond paying £45 or £50 per annum rent, with the large percentage of taxes incident to a residence inside the district lighted and watched by the Town Council. There is a fashion in everything. Bay windows seem as much the rage now as hoops and crinoline! All Mr. Hughes' houses have their parlors enlarged and their exteriors decorated with this appendage, and fitted up with arrangements for hot and cold baths, sunk and covered ashpits in the yards, and everything necessary for comfort and convenience. The workmanship alone is contracted for, the proprietor supplying all materials and the whole superintended by Mr. M'Alister. The nine houses on the south side have the peculiarity of a double frontage, the returns extending to University-street, with the yard wall in the same street built up to an equal height with windows and cornice above. This has the advantage of making the return bedroom one of the most cheerful and desirable in the house, which is far from usual.

We understand that the shares for the Ulster Hall have been all taken up, and that there is a good prospect of soon seeing the building in progress, which we hope will be such that it will meet the requirements of what Belfast will be 30 years hence. The increase of everything musical, shows that musical taste is progressing more rapidly than what is due to the mere increase of the population, so that the new building should exceed the present wants of the town in a duplicate ratio.

---

* Mr. Symes is the architect; and Messrs. Roberts, of the Appian-way, are the builders; and Messrs. Hogan & Son, of Great Brunswick-street, the contractors for the cement and plastering work.

ON THE THEORY AND PRACTICE OF VENTILATION.

The following is an abstract of a paper read by Dr. Haughton at a recent meeting of the Royal Dublin Society:—The author maintains that highly heated rooms are more easily ventilated than cold ones, when the most trifling attention is paid to this important point in their construction. The general impression that cold rooms contain a purer atmosphere than those which are maintained at a comfortable temperature, is seldom verified except when actual draughts are produced in the former, which are fully as hurtful in the production of inflammatory affections, as the opposite evil is in the induction of chronic constitutional disease. The difficulty of avoiding Scylla, in escaping from Charybdis, is not, in this instance, so great as has been imagined, because nature has kindly provided the means of removing all noxious gases, if we only assist her efforts in a very small degree. It is obvious that gas and watery vapour, when passing off from the lungs or skin of an animal are always in a heated condition, the result of which is the presence of an upward current in the atmosphere, which constantly draws an equivalent quantity of pure air from the surrounding strata. In this manner all dwelling-rooms tend to ventilate themselves, if apertures in the ceiling, and corresponding ones below are provided, so that a complete circulation may be established; but from the frequent neglect of these simple means, warm rooms have been stigmatised as "close" and unwholesome, the degree of insalubrity being supposed proportionate to the heat experienced. But so far is this from being the case, that the converse is much nearer to the truth; the fact being, that there is no reason why the air of a cold room should ever alter its position when impure, inasmuch as the air outside is of corresponding density, and therefore has no power to expel it. But in a highly heated apartment there is a marked and constant difference in the specific gravity of the air inside and that without, thus giving rise to an extremely rapid circulation, and consequent thorough purification of its gaseous contents. This is quite a sufficient guarantee against the possibility of the communication of any infectious disease by the atmosphere of such apartments; and in the case of hot chambers, used for bathing purposes, it is not necessary to suppose that noxious virus is actually destroyed by heat, when we see that, even were it present, it must be immediately carried off. Those who have witnessed a prairie fire, or the conflagration of a forest, are aware that stormy weather is a usual sequence of such occurrences, in consequence of the upward current occasioned by the heat; and every tyro in physical geography knows the effect of the sun's rays in the production of currents in the atmosphere. In other words, heat is the very means employed by nature for the purification of the air of this globe, and there is no reason why it should not suffice to purify the edifices we erect upon it. The common usage of the inhabitants of cold climates, is a presumption that warmth within doors is beneficial, for the colder the climate, the higher do we invariably find the temperature of their dwellings; the snow-house of the Esquimaux being a beautiful instance of architectural perfection in the preservation of warmth under difficulties. The production of artificial currents by heat outside the room to be purified is, no doubt, a very powerful, but does not seem to be a very satisfactory means of ventilating, as its application to the Houses of Parliament has occasioned complaint against it from the members on account of the sudden changes of temperature, and the dust which was raised by it. The ventilation of Roman baths (as described by Vitruvius) was effected in a manner both simple, cheap, and efficacious; the ceiling been domed with a central aperture, closed by a shield (suspended by chains) which was raised or lowered according to circumstances. For the ventilation of new dwelling-houses, Count Rumford's air-shaft offers peculiar advantages, especially to those who study economy of fuel, as by means of it an entire dwelling can be maintained at a comfortable heat in cold weather, without unusual expense. In order to understand its principle, we must recollect that when rooms are heated by open fires, air has a tendency to flow *towards the fireplace* from all openings whatsoever that may be made in the room. The ascent of the smoke creates this tendency; and advantage has been taken of the smoke-flue itself as a means of ventilation, in the common Arnott's valve, but when the wind is variable, smoke is apt to regurgitate into the room from all valves which are so situated. To obviate this, an air-canal ought to be constructed *in the building of every house*, in or near the centre of each stack of chimneys. It may be about twelve or fifteen inches square in the clear; and two branches from this air-canal (both furnished with registers) should open into each of the adjoining rooms; one of these branches opening into the fire-place just under the grate, and the other over the fire-place, and near the top of the room, or just under the ceiling. Each of these branches should be about four inches square in the clear; and to prevent the uncouth appearance of the open mouth of that which opens into the room over the fire-place, it may be masked by a medallion, a picture, or some such ornament, placed before it at the distance of one or two inches from the side or wall of the room. This air-tube should not rise quite so high as the chimneys, but should end (by lateral openings communicating with the external air) immediately above the roof of the house. It is desirable that the lower end of the air-canal should open somewhere near the ground; but when there is any suspicion of noxious emanations from the soil, it is advisable to place its open mouth in such a position that it may be well supplied with the best air which the locality affords. There may be difficulties in applying this principle to old houses, but the expense of building a new house is very little increased by this most complete and beautiful contrivance. Where it is adopted, *the chimney never smokes*, because the fire is supplied with an abundant stream of air from without, by means of the tube opening under the grate. *There need never be a draught*, because the air does not traverse the room in any considerable quantity. *Less coal is consumed*, because heat is not wasted in first warming the air of a room and then carrying it up the chimney. Need more be said to any intelligent person, to convice him of the expediency of adopting a plan which combines comfort with economy, and both with salubrity? It is easy to perceive that by closing the lower register, and opening the upper one and one of the windows of the room, a complete renewal of the air immediately takes place. Nor does this cool the room at all to the extent that might be supposed, as we must never forget that it is the room which heats the air, and not the air which heats the room. Heat being only generated, or made available, when the rays come in contact with the walls of the room or other solid objects which absorb them, and subsequently give them out again to the atmosphere. In the rude buildings of uncivilized peoples, numerous crevices supply the place of ventilators, and the latter therefore are not so much needed; but the more perfect is the joiner's work of a house, the more indispensable is it to provide *special* inlets or outlets for ventilation. The abolition of old-fashioned chimneys, which formed such admirable ventilators, does not seem to have been followed by the introduction of a substitute, so that we have not gained by the change, unless we adopt some artificial remedy, such as that recommended by Count Rumford, and to which the paper of Dr. Haughton has again directed public attention. The main idea which pervades the above paper is simply this: That heat is the means by which currents are produced in the atmosphere most readily and efficiently, and that rooms which are maintained at a proper temperature only need inlets and outlets in *suitable situations* in order to be self-ventilating. That by means of register-slides to these apertures, the ventilation of a room and its temperature may be regulated with the greatest nicety. The occurrence of bush-fires in Australia has recently afforded a melancholy illustration of the effect of heat in producing atmospheric movements. Hot winds having blown with great violence almost immediately after the fire had commenced.

GLASS AS A MATERIAL FOR WINDOW-SASHES.

As yet this patent invention has been practically applied but to a very limited extent in Ireland, there being but *one* establishment in Belfast, *one* in Waterford, and *one* in Cork, in which it has been adopted; and the Dublin architects and builders seem to regard the invention with special disfavor, and reject it *in toto*.

The crystal sash-bars, such as we have recently seen in the English metropolis—where every invention worthy of appreciation is eagerly sought after—have a brightness, cleanliness, and lightness, which at once catch the eye of a passer-by, and contribute (where judiciously applied) a pleasing and novel effect. But in the application the difficulty consists, for with them the entire design should harmonize, and a corresponding lightness be given, both in construction and painting, to surrounding features, such as showboard, storyposts, &c. They require little manual labour to keep them clean, are not liable to rust, and, though composed of a brittle material, are in reality not so, as may generally be supposed, but maintain their position permanently, being unaffected by atmospheric influence, externally, and strengthened internally by stout metal tubing, which may either be highly polished, silvered, or gilt, as desired. We should at least recommend them to the consideration of our local architects, and as they are obtainable at prices varying from *seven* shillings to *twenty* shillings per foot, they are worth a trial, and, when once introduced, we doubt not will be extensively adopted.

NEW BANK LOCK, WITHOUT ANY KEY OR KEYHOLE.

This is a bank lock, which absolutely defies the skill of Hobbs. It works in this wise. Around the door knob of the Bank is a small brass index; on which are numbers from 1 to 100. You lock the door and then set the index to any number you please (say 27), by turning to the right. You then set it to a second number (say 95), by turning it to the left, and then a third number by turning it to the right again. You then give it a twirl, and go off and leave it. In the middle of the night, up comes a burglar with his dark lantern and skeleton keys. He examines the lock—no use for skeleton keys, for there is no key-hole to put them in. No use for gunpowder, for there is no place to pour it. There is a round brass knob with figures round it, that is all.—Clearly, his only way to get in, is to turn the knob to the right number. He begins to try, he turns it to every number on the index, from 100 to 1—still no go. When he reaches the right number, there is no click or other intimation that he *has* reached it, and he is likely to go past it as to stop—granting even that he accidentally hits on the first number, he must lose it in trying to find the second and third; he has to find the right three numbers, and find them in the same order that you set them and keep each when found—in other words, he must find the right one, out of over a million combinations of figures! If the night was as long as Mathuselah's life, the morning would find him at his unavailing work. At 9 o'clock you come along, turn the handle to the right numbers in succession, open the bank with perfect ease, and attend to business. It is no use to knock down the cashier on his way home at night, in order to rob him of the key—he has no key; the key, such as it is, is left in the door; all the cashier has, is the memory of certain figures in his head, where they cant be got at. Neither does its excellence depend on complex and secret mechanism, it is very simple, any body can understand it, and the more thoroughly he understands it, the more completely he comprehends the impossibility of unlocking it. One of the chief troubles of most bank locks is, that they get out of order; a cog is worn, or a spring falters and the lock won't turn, and then the bank officers are kept out as well as the burglars—but this one has no springs; it cannot falter, it must turn when the right numbers are known, and no amount of strength can turn them when they are not. It is called "Covert's Permutation Bank Lock," patented Oct. 5, 1858, which is in use by Banks in the State of New York and elswhere, where they have given *entire* satisfaction.

ROMAN BATHS.

IT is well known, that amongst the Romans, bathing formed a part of every day's occupation. It was a luxury universally indulged in by both sexes; and the buildings erected for the accommodation of the public were generally remarkable for their costliness and splendour. In the year 1824 the baths of Pompeii were excavated. They are admirably arranged, spacious, highly decorated, and superior to any thing of the kind in modern cities. They are fortunately, in good preservation, and throw considerable light on what the ancients have written upon the subject.

It was customary with the Romans to solemnize the completion of a public work by dedicating it, which consisted simply in opening the building to the people in a solemn manner, and gratifying them with largesses and the exhibition of spectacles, to which that extraordinary people were exceedingly partial. Various circumstances prove that the completion of the baths only a short while preceded the destruction of the city. They occupy a considerable space, and are divided into three separate compartments. One of these was set apart for the fireplaces and the accommodation of the servants; and the other two were each occupied by a set of baths, one of which was appropriated to the men, and the other to the women. The apartments and passages are paved with white marble in mosaic, or alternate white and black squares. The chambers are ornamented with various devices, and highly finished. Above one thousand lamps were discovered during the excavations.

There were three kinds of baths; the frigidarium, or cold baths. The frigidarium is a round chamber, encrusted with yellow stucco, with indications here and there of green. The walls are ornamented with figures modelled in stucco. The bason is twelve feet ten inches in diameter. and two feet nine inches deep, and is entirely lined with white marble. The plan for emptying and filling it was smiliar to that adopted among ourselves. This frigidarium is remarkable for its preservation and beauty.

The tepidarium was so called, because its temperature was of a mild warmth, and which prepared the bodies of the bathers for the more intense heat which they were to undergo in the vapour and hot baths, and also softened the transition from the hot bath to the external air. It is divided into a number of compartments by Telamones,[*] two feet high, carved in high relief, placed against the walls, and supporting a rich cornice. They are composed of baked clay, encrusted with the finest marble stucco. They have been originally painted of a flesh colour. with black hair and beards. The basket on their heads, and the moulding of the pedestal, were in imitation of gold. The pedestal itself, the wall behind, and the niches for the reception of the bathers' clothes, were an imitation of red porphyry. The ceiling is worked in stucco, and ornamented with figures and carvings. The window of this room is two feet six inches high by three feet wide, in the bronze frame of which were four beautiful panes of glass, fastened by small nuts and screws, so that they could be removed at pleasure. From this, it is evident that windows of glass were in use among the ancients. Glass-blowing seems to have been better understood by them than the learned seem inclined to admit of. This is proved from the quantities of bottles, vases, glasses, and other utensils which have been discovered at Pompeii. Amongst other articles found in this bath was a large and handsome bronze brasier.

The caldarium had on one side the laconicum, where was placed a vase, called labrum, for washing the hands and face. On the opposite side was the hot bath, called lavacrum. The labrum was a great round basin of white marble, into which the hot water bubbled up through a pipe in its centre, and served for the partial ablutions of those who took the vapour bath This apartment like the others is well stuccoed, and painted yellow. These details, although necessarily circumscribed, affords us some idea of the value which the Romans attached to bathing.

ASSOCIATIONS FOR THE PROMOTION OF ART.

By MR. GEORGE F. MULVANY, R.H.A.

[Read at a recent meeting of the Fine Arts and Photographic Section of the Royal Dublin Society.]

HAVING been honored by an invitation on the part of the Committee of Fine Arts to assist at the meetings of this section, I have felt much pleasure, however diffident of my power, in endeavouring to contribute something to the subject matters for reflection and discussion; for I hold that such reunions as these are eminently calculated to advance the interests of art. They bring together the artist and the amateur, the practical and theoretical lovers of pure art, in conjunction with the scientific developers of what I would call a wonderful method of fact-painting; a new and great discovery of our time, which must be inseparably linked with the future of all art. The interchange of thought between men earnest in these refined and somewhat abstract pursuits, must tend to advance the several objects of their interests, and under the new arrangements of these sectional meetings, some hard-headed logician or dry utilitarian may drop in from his own more practical division and find that there is more common sense and use in the Fine Arts "than was dreamt of in his philosophy."

I do not intend to discuss this evening any of the various phases or principles of art which would, doubtless, be legitimate subjects for consideration. I would rather seek to draw your attention to the condition of art in the country, and the important question how its interests can be promoted, and the latent genius of the country be developed.

It must be admitted that the state of art in Ireland is far from creditable to the country. It cannot be asserted that this is attributable to any deficiency of natural genius or to any want of industry and zeal on the part of artists themselves. It results mainly, if not solely, from the want of public encouragement—of that demand which has, in all ages and in all countries led to the fullest development of human ingenuity and skill. The most frequent argument raised in defence of such a state of art abeyance is, that we have not wealth enough for its adequate encouragement. The argument is unfortunately not without weight as regards individual patronage; but given its fullest weight, it is an argument, *a fortiori*, in favour of the associative principle which does so much for art in more wealthy communities. Perhaps it would be more candid to admit that taste, as a diffused social element, rather than wealth is wanting. To generate and cultivate this public taste must be the first aim of all who desire to promote art in Ireland, and it is the chief aim of all art associations. Education of artists and of the public by schools and exhibitions are the functions of some; while others seek by the purchase and dissemination of the works of living artists to reward merit and stimulate taste by facilitating the possession of good works of art.

I propose to draw your attention principally to these latter institutions; but I cannot in the interest of the associative principle, especially within these walls, omit to pay my tribute of grateful admiration to the parent association for the promotion of the fine and useful arts in these countries. The Royal Dublin Society, established for the advancement of husbandry and the useful arts, promptly recognized the value of the fine arts in connection with industry. The principle so asserted by the establishment of its schools, more than a century past, is now the recognized principle of Government Schools of Design. The Society's schools rapidly acquired an importance, not, perhaps, at first designed. Under the auspices of this Society, those wonderful achievements of ancient art—those marvellous embodiments of perfect form in almost breathing marble—the sculptured gods of classic Greece—became known in this remote island, awoke the artist's spirit to a new sense of beauty, and led rapidly to a new development of power.

Artists as they multiplied naturally sought strength in association; but beyond their influence in education and their efforts to maintain public exhibitions, I do not regard societies of artists as, strictly speaking, associations for the encouragement of art. They are producers, not patrons; they seek to cultivate art; they are valuable, rallying centres of professional union and distinction. It is their duty and their aim to raise the standard of public taste; but they are themselves dependant for existence and success upon an appreciative public. When incorporated by charter or royal sanction on the Continent, they are subsidized by the state; in these countries they are mainly dependent on the revenue from annual exhibitions. When these are prosperous, as in London and Edinburgh, the royal academies prosper and acquire influence and power of effecting public good. The Royal Academy of London is, perhaps, the wealthiest association of artists in the world. It enjoys a revenue of £6,000 or £7,000 per annum from its exhibitions; after maintaining its schools and establishment, and devoting much of its funds to charitable support of distressed artists and their families, it has amassed a large fund. The Scottish Academy has from similar sources of success derived a large income, and has made a noble use of it, by accumulating a fund for charitable relief, and the acquisition of a valuable collection of pictures, at a cost of upwards of £15,000, which is now deposited in the National Gallery of Scotland. The Royal Hibernian Academy is unhappily, as regards worldly prosperity, but too true a reflex of the want of encouragement of art in the country.

---

[*] Figures of men, usually in a slightly stooping position and supporting cornices in buildings.

Other associations may be referred to, such as the British and the Royal Irish Institutions, designed to afford objects of study to the young artist, and to cultivate public taste by the exhibition from year to year of works by the ancient masters—the property of private individuals. The latter named institution had but a brief existence; but it has found, after the lapse of years, a successor in the Irish Institution, established in November, 1853, with the ultimate aim of the formation of a National Gallery. The building now in course of erection in Leinster Lawn, to which the Dargan Testimonial fund has been devoted, combined with parliamentary grants, is the best evidence of the work done by the Institution, and assures to Ireland its long-desired National Gallery.

From the period, however, when the Dublin Society established its schools, when Barry and Barrett first won distinction, and carried off their fifty-pound prizes, to the present, the history of art in Ireland, with some fluctuations, has been the same—upspringing genius—well-directed philanthropic efforts to facilitate education—honour and reward to the student—struggles, difficulties, and non-appreciation for the artist. Hence it arose that so many distinguished Irish artists have followed Barry and Barrett to swell the fame of the British school, while many, whose natural gifts and educated powers were at least equal to those of the emigrants, have remained at home—forced too often to devote talents calculated for higher development, to the mere drudgery of art.

I am far from undervaluing what has been done for the promotion of art in Ireland by the education of artists, or the cultivation of public taste; on the contrary, I honour those who have persevered through all difficulties in the good cause, and I rejoice that we may regard our educational facilities as being nearly placed on an efficient basis. But, what I wish particularly to enforce is, that in point of national economy, all those energies are without their proper return, if we do not find means to secure prosperity to the artist as well as education to the student. The developed intellect, skill, and productive power of a country, are even in an economic point of view amongst its acknowledged elements of wealth. I need not, therefore, dwell on the importance of developing a national school of art—of keeping our gifted men at home, instead of forcing them to bring their talents and wealth-producing powers elsewhere. It will be better to show how this public good can be achieved. Example is better than precept or argument, an , fortunately, an example is found in the progress of art in Scotland.

Twenty-five years ago, the state of art in Scotland was not dissimilar to its present state in Ireland. There was, perhaps, more private patronage of art, but the public interest in its progress or demand for its productions, was small indeed. The Royal Association for the promotion of Fine Arts in Scotland was established, I believe, in 1834. It was the first effort to introduce into these countries the German system of *kunst vereine*, or art-unions. It has been signally successful in its operations. In its first year the funds subscribed did not exceed £700 or £800; its average income now is about £5,000 per annum. Not only has this association evoked a Scottish school of art, to do which was its first aim by the purchase of resident Scottish artists' works, but it has expanded its operations to the purchase of works of art without reference to the country of their production.

Strong objections were raised to the system of Art Unions at the period of their introduction. It was said that they were calculated to interfere with private purchase of works of art, which, as the result of discriminating taste, and the legitimate expression of demand, was morally and economically the true encouragement to art. This objection was strongly urged by artists themselves; but experience has shown that it was not valid, and Art Unions, so far from diminishing, have considerably stimulated, and increased both private and state patronage. I cannot better illustrate the force of these early objections and the power of successful experience in dispelling illusions, than by a short quotation from a speech made by Mr. Harvey, a distinguished member of the Royal Scottish Academy, at a dinner given by the committee and members of the Edinburgh Association in 1846. Mr. Harvey said:—"When the Royal Association for the promotion of Art in Scotland was formed, rather more than twenty years ago, I at that time felt it my duty to be one of its resolute opposers, thinking it likely that the purposes of art would be better served by such works as might be produced being purchased by private parties in the usual way, rather than by funds acquired by public subscription, and the subsequent disposal of the paintings by lot. My friend, Mr. Glassford Bell, who was the great promoter of the scheme at the time, kindly said that he would meet my opposition by the purchase of my paintings, should I produce anything which the association might consider worthy of buying: and accordingly I had an offer made to me in the ordinary way for one of my works shortly after. This offer, to be consistent, I declined, and I have the painting in my possession still. Since that time, however, I have seen fit to alter my opinion on this subject. In fact, when I call to mind that in, I think either the second or third years of the Academy's existence, the entire sum received for works of art sold during the period of the annual exhibition was, if my recollection serves me rightly, only thirty-five guineas—one painting having been bought by the present Lord Justice Clerk, then Dean of Faculty, for thirty guineas, and one by some person else for five—it was evident that in this state of things something required to be done one way or another."

This candid admission on the part of Mr. Harvey, speaks volumes for the cause of such associations as we are now considering. In fact, such was the success of the Edinburgh Association, and so much was the demand and love for art increased in Scotland, that in 1842 the Glasgow Art Union was established. The success of this latter Institution, at least as to amount of funds, is unparalleled in the brief history of Art Unions. Of course the annual amount varies; but in 1856 it exceeded £20,000; and in the last report of the Council of the Scottish Academy it is stated—such was the competition between art union committees and private purchasers—that, on the opening day of the Exhibition of 1858, nearly £5,000 were expended in purchases in the gallery. A happy contrast, certainly, to the season referred to by Mr. Harvey, when the total amount of purchases was thirty-five guineas.

When the Art Union of London was established in 1837, there was no lack of purchasers, as the numerous and prosperous art exhibitions of that metropolis testified. However, beyond the enjoyment which those exhibitions afforded, the luxury, the home enjoyment of art was confined to the wealthier classes. So little were the purposes of Art Unions understood, or so coldly was their interference with private purchasers regarded, that in the first year of the London Art Union, the subscriptions only amounted to £489 6s. The great middle classes, however, soon recognised the importance of the Institution, and the total subscription for 22 years amounted to £238,932. The beneficial results of so large an expenditure, in addition to the undiminished amount of private purchase, must be obvious to every one. Some object to it as an artificial stimulus calculated to produce a superabundant mediocrity. I cannot regard it in any such light; for mediocrity in art will only be tolerated by mediocre taste, and the constant diffusion of good works of art through means of Art Unions—the increased stimulus to good local exhibitions throughout the country—the very excitement about art so caused must lead to improved taste. The works of the first-rate artists are never in the market for Art Union purchase; not because those societies do not occasionally give high prices, but because those artists are pre-engaged often for years by private individuals. Through all these means a public opinion has been created, recognizing the social value of art, and the importance of its highest development, which has stimulated the State—ever slow to move until it feels the pressure from without—to expenditure in the patronage of the higher branches of painting and sculpture, as well as to a gradually expanding system of education in art by schools and public galleries. Nor must we overlook another important fact in connection with such associations: it is not the wealth of particular localities that is represented in the large annual incomes of the London, the Edinburgh, or the Glasgow Associations. They draw their resources from all countries, and especially from our vast and increasing colonies, while it must be observed that the benefits of the expenditure is mainly confined to England and Scotland. From Ireland alone these three Art Unions in 1858 drew upwards of 1,150 guineas. The committee of the Glasgow Art Union, remark in their last report, as a reason for not being more exclusively purchasers of Scottish artists' works, "that a comparatively small amount of their subscriptions are obtained in Scotland." Surely for us these are suggestive facts.

I have drawn your attention in the first instance to these institutions in Scotland, on account of the priority of their establishment, and because there exists a greater analogy between the circumstances of this country and that, than between those of Irelan and England. I would also say that the analogy was illustrated forcibly by the brief experience we had in Ireland of a prosperous art union, A gleam of promise—our national sunburst—shed its influence on art and art institutions. The exhibitions of the Royal Hibernian Academy expanded in size, interest, and merit, and a consequent rapid improvement took place in the exhibition receipts. The energies of resident artists were awakened, and their ambition aroused. It was, unfortunately, a brief success, but it was enough to convince every thinking man, that in the associative system of encouragement lay the best hope of developing the latent talent of this country. I think too much stress is laid upon the failure of our first Art Union. It would be far better to regard the very large amount of success it achieved, as shewing what can be done by well directed energy. There may have been errors in the system, or improvidence in the management, which left the institution unprepared for the fearful ordeal through which this country had suddenly to pass; but, taught by experience, a system more calculated for permanence can be devised, and there is nothing in the present position of Ireland or its prospects to forbid the hope of rseuscitating art, and establishing a school worthy of the country and "racy of the soil."

THE DUBLIN CORPORATION—PAVING-STONES.

FROM a letter addressed to the editor of an American journal *(The Boston Pilot)* we quote the following, relative to the pavement of our city—a subject already treated of in the "DUBLIN BUILDER":—

"In Dublin we have a reformed corporation that stands eminently in need of reformation. Our streets are incumbered with gutter, and our newspapers are filled with a puddle of words.

"It is the virtue of a paving-stone (for paving stones, like politicians, have their virtues) to unite roughness with durability. This is the paramount virtue of an excellent paving-stone. This felicitous combination is conspicuous in granite, whose very name implies an aggregation of grains. Hence, among the great swarms of boulders which the mellifluous lyre of Orpheus huddled in haste together by its melodious chords, a granite boulder was (or ought to have been) proclaimed, by unanimous consent, prince of the paving-stones. It was the learned decision of Mr. Jukes, that Irish limestone paving-stones are only 'indurated mud.' Since that fatal judgment, the Irish paving-stones have been motionless, black, dejected, and cast down. But, by way of restoring their hilarity, it should be impressed upon them that Parian marble is likewise indurated rubbish, as indeed all aqueous strata must be, and Mr. Jukes was only laughing at the geologic ignorance of our excellent civic councillors, when he pronounced that fatal judgment on our Dublin *ashlers*.

"It is quite certain that Ireland is a sheet of secondary limestone, broken up by the upheaval of primitive masses, which smashed up through the limestone, and tower in mountain form here and there through our island. This is Irish geology. The mountain granite, where it is not superficial, where it is quarried from any depth, or drawn from the breast of the mountain, is an excellent stone, and our corporators should take measures to have this lasting and beautiful stone (equally adapted to paving and building) exported to foreign lands, as it used to be some time since carried to Liverpool. The best judges state that granite 'sets' or blocks, six inches in breadth, and placed on a solid basis, let us say a quarter of an inch or half an inch asunder (so as to give the hoof of the horse a grip of the stone), constitute the most durable pavement. Hugh Kelly, the builder, went to Fox Rock in last June, and got thirty tons of close-grained granite cut into paving "sets." They were delivered in Hanover-street at a cost of 15s. 6d. per ton. Kelly's paving stones are laid down in one small space on Essexquay, opposite houses 5 and 6. The remainder of that quay is paved with Welsh whinstone. The superiority of this patch of granite is apparent to every pedestrian, as well as every one who passes over it on a car. When you drive over the Welsh stone you feel as if iron were under you, but when rolling over the granite you seem to be rolling on a deal board. This is the sensation which the pavement communicates to a person on a car. Here a question presents itself, Why did they not use more of these blocks? The answer is an illustration of the condition of Ireland, and merits attention.

"Owing to English institutions, we use the harbours of England, which are bad, and the paving-stones of Wales, which are worse, while Irish harbours and Irish paving-stones remain altogether unused. The paving-stones from Pennanmauer, in Wales, of which eight thousand pounds worth were imported into Dublin during 1857 and 1858, are rough-hewn out of a kind of green whinstone. These stones smoothen and grow slippery in time, to prevent which it has been found necessary to have wide joints between the stones, and check the joints with gravel or grout, which affords foothold to the horses.

"As even in America streets must be paved, I should strongly advise American paviors to read these Irish experiences in paving. The Welsh stones, when cast on Dublin Quay, cost 11s. 6d. per ton. The cartage to the street which requires paving adds 8d. to the price; making in all 17s. 2d. per ton. The Welsh labourers get 2s. a ton for rough-hewing sets; the royalty is said to be about 6d. per ton, and the cost of supervision and cartage to the ship may be about another shilling per ton. These elements raise the price to 8s. 6d. per ton, which gives a profit of 6s. per ton to the Liverpool contractor.

"Now, the query is—Whether some American Irish contractors cannot pave American cities with Irish granite, as we patriotically pave our Irish streets with Welsh whinstone? Irish stone has been imported into Newfoundland to build a church. I do not see why it should not be imported into Boston to pave the streets. Labour is so cheap in Ireland that *calpe* or limestone blocks are delivered by the County Dublin quarrymen for 3s. per ton. These are termed *ashlers* or rough lumps of limestone which must be rough-hewed. For this rough-hewing the stone-dressers get 2s. 6d per ton. They cut two tons of such out of every five tons of ashlers. In a word, the black limestone paving-blocks of Dublin when *dressed* for use do not cost more than 7s per ton—8s. 2d. less than the Welsh whinstone. Compare this with the price of your Boston paving-stones (if you do pave), and see what you can do for us."

Correspondence.

TO THE EDITOR OF THE DUBLIN BUILDER.

SIR,—Having seen an article in the "DUBLIN BUILDER" for April last, giving a description of the plastering and stucco-work of the interior of the Roman Catholic Chapel, St. James's-street, I trust it may not be amiss in setting you right as to some omissions therein, especially as the work done by me is but slightly noticed. Any casual observer (leaving gentlemen in the building trade out of the question) will see the work executed in the chancel is omitted, altho' the ceiling is so peculiar in its section, being that of a flat triangle, from springing to apex 17 feet 6 inches high, that the most inexperienced person will perceive the difficulty of its execution. The great arch of chancel, with its group of mouldings, is a triumph in the art of plastering (see advertisement). When the nave was advertised, my estimate was £1,251 16s. 1d. When the side aisles were advertised, I would not tender for them. C. W. GIBLAN,

26, Gt. Brunswick-street.

COMPETITION FOR CHURCH—SS. PETER AND PAUL, CORK.

TO THE EDITOR OF THE DUBLIN BUILDER.

DEAR SIR—The following few particulars relative to this memorable competition may prove interesting to your readers:—It had been in contemplation for some time back, to rebuild this church, and Messrs. Pugin and Murray furnished designs for it, which I have seen, and very good ones they were; but for some reason a competition was determined upon, though it was intended, *from the first, that Mr. Pugin should have it.* A committee was appointed, composed of retailers of soap, candles, tea, sugar, whiskey, shoes, carvers and gilders, &c., and who admit, themselves, that they know nothing of architecture. Seven architects, *Pugin*, *Hadfield*, *Murray*, *Atkins*, *Nicholls*, *Wigley*, *Hurley*, and *J. P. Jones*, two builders, and some students of the School of Design, Cork, competed.

My design was acknowledged on all hands to be the best, but the committee made an excuse, because I coloured that I broke the rules; this my instruction did not prohibit; and I even asked the question, and was allowed to do so; I also engaged to get my design erected for the sum at their disposal; but their objection I care not now to notice, for the Rev. Canon Murphy, for whom the church is to be erected, and, indeed, who is going to do it almost at his own expense, wrote to me, stating "that there could be no doubt or question as to the superior merit of my design."

The committee, as I was a Protestant, prejudiced against me, would not consider my design; but the Rev. Canon Murphy said the drawings ought not to leave Cork, and he bought them himself at my own price. So far for my part in the matter; but, sir, other competitors have been most shamefully used. For instance, Mr. Murray's design was rejected, because, it is said, he had some difference with Mr. Pugin; and the design to which the first prize was given would be a disgrace to an ironfounder. The parapet of the tower, for instance, was similar to the cresting of the fender in my office. The whole thing was such as children make with cardboard, or what you see on china plates, or the bottom of wash-basins. Putting my own design out of the question, I will give you my impartial opinion of the rest. Murray's was the best exterior; Atkins's the best interior; Nicholls's second best; Hadfield and Goldie's third. Pugin's was a very poor design, and carelessly got up, as I suppose he was sure of it, under any circumstances. Murray's, Atkins's, and Nicholls's, were really beautiful drawings, as were also Hadfield and Goldie's. Hurley's was what you may call the engraving style, cast-iron design. The canvassing of the committee was beyond comprehension: as one of them said he was "badgered" from morning till night by one of the competitors and his friends.

I think the following would be a fair decision:—Atkins, Murray, Nicholls, Hadfield and Goldie, Pugin.

I take no notice of myself, as my design has been purchased, and I have letters by me to corroborate the above —J. P. JONES, London.

Allow me to state that I have been met in the most straightforward and honorable manner throughout by the Rev. Canon Murphy, who is not answerable for the "fancies" of an unintelligent committee.

Monuments and Memorials.

It is intended to erect a monument to the late Marquis ef Waterford, and the subject has been referred to the Earl of Howth, Lord St Laurence, and Lord Ingestre. One idea is, that of a bronze equestrian statue, which would cost about £1,500, in the demesne at Curraghmore; another, a monument in the centre of the people's park in Waterford; and a third, to imitate the example lately set in the Wellington memorial, and to build and endow an institution for the relief of jockeys or huntsmen, who are disabled by accident or overtaken by old age.

Some of the admirers of the late Sir Philip Crampton desire to perpetuate his memory by the erection of a testimonial.

The sum of £1,205 has been raised in aid of the proposed memorial to the late Augustus O'Brien Stafford, M.P. The committee have contracted for the stone and timber work at Limerick Cathedral for £800. and for the stained glass for £400, which works are now in progress. About £400 more is required to complete the designs of the architect.

Notes of New Works.

A congregational church is to be built in the town of Galway.

A new cathedral church is to be built at Loughrea, on the site of the present parish church.

Two new schools for the Christian Brothers are being erected at Enniscorthy.

The South Dublin Union workhouse additions are still for disposal to a contractor, the estimates furnished having exceeded the expected cost; and only one wing is now to be built, instead of two as intended.

Messrs. Brown, Thomas and Co., Grafton-street, have commenced another large extension of their premises, and the expenditure will be upwards of £2,000. Mr. Caldbeck, architect; Mr. Rooney, builder.

Messrs. Sheils and Scott, of Castle-street, have taken the house, No. 29, Westmoreland-street, and are making additions and alterations thereto, according to designs, &c., by Mr. Lyons, architect. Mr. William Hughes is the builder.

Mr. Madden, of College-green, is newly fronting, in bow form, his premises there, but, considering the position, a design of greater merit might have been introduced.

An important building, designed for "practising schools," is being erected by the Commissioners of National Education, at the rere of the Central Model Schools. One elevation will face Lower Gardiner-street, and another the existing buildings in Marlborough-street; thorough access from front to rere being maintained through an open and lofty groined passage, 14 feet wide, with splayd, moulded, and semicircular headed entrances placed in a two-storey central projection, which forms a chief feature. The total length of the building is 212 feet, the wings and connecting portions being only one storey in height, and the general plan of oblong form. On the ground floor at one side of archway are apartments comprising mixed school for 100 pupils, boys' schools for 80, 50, and 40 pupils respectively, cap-rooms, porches, &c.; and on the other is a principal stone staircase and girls' schoolroom similarly classified to opposite wing, cloak room, &c. The elevations will be somewhat of Byzantine character, and present noteworthy features. English red brick and Glasgow sandstone rubbed smooth, are the materials provided for the dressings of doors and windows, groins, cornices, chimney shafts, &c., &c., and hammered limestone for the general external walling. One large lecture-room occupies the second storey. The paving under archway is specified to be of "*whinstone set and laid similarly as the Corporation are now using in the streets.*" The plans for this building (as well as all others recently designed for the Commissioners of Education) were furnished by the Board of Works. Mr. John Nolan, of Meredyth-place, is the builder. Total expenditure, when completed, will be about £6,000. The Scotch stone used in this building is from the quarry of Messrs. Gray and Co., Kenmuir, Crowhill and Milltown, near Glasgow.

It is in contemplation to construct a line of railway from Downpatrick to Newry.

Messrs. Cannock, White and Co., have entered into further building contracts at their monster establishment in Henry-street. Mr. Anthony, architect; Mr. Wm. Hughes, builder.

A church and schools are to be built at Rathgar, on a road proposed to be formed, and which will be carried across the Dodder over a bridge to be constructed nearly opposite the demesne gate of the Lord Justice of Appeal.

A new Catholic Church, in the early Gothic style, from designs by J. J. M'Carthy, Esq., R.H.A., has just been roofed in at Portlaw, Co. Waterford It consists of chancel. nave and aisles, with bell-turret; the porches, sacristy and spire are yet to be built. The church is 110 feet long by 60 feet wide in the clear. The aisle walls are 14 feet, and the nave walls 34 feet high; height from floor to nave-ridge, 60 feet. The chancel is separated from the nave by a lofty arch, 42 feet high. The aisles are lit by single and double light windows, and the clerestory by 10 spherico-triangular lights. A lanceolated triplet gives light to the sanctuary; and in the western end is a window of two-light, with masonry mullion and traceried top. The roof is open, to be stained and varnished hereafter. The leaden sashes, with the necessary ventilators, are set in frames of granite, of which material all the dressings are composed. The walling is faced with dressed limestone. in horizontal and perpendicular joints, which has a very pretty effect. The work was commenced in April, 1858, and the whole shell was completely covered in in the short space of 10 months! The expenditure was about £2,500. The builder was Mr. Richard Pierce, of Wexford.

The Ecclesiastical Commissioners are about enlarging the churches of Cove, County Cork; Ballymacarrett, County Down; and Abanagh, County Sligo.

A new school-room and other works are to be built at Beggar's-bush Barracks, by the Board of Ordnance.

Another timber-wharf is to be constructed at Northwall-quay, between Commons-street and the western timber-wharf. This is the third structure of the kind recently undertaken by the Ballast Corporation, and betokens increasing commerce.

New station buildings are to be erected at Brook Lodge, and a terminus at Tuam, by the Athenry and Tuam Railway Company. Mr. Hemans is the engineer, who has furnished the drawings, &c., but, properly speaking, this is the legitimate business of an *architect*.

A new and splendid room has been added to the County Club-house, Carlow. Mr. Lynch, of Carlow, being the builder; and Messrs. Hogan and Son, of Dublin, the contractors for plastering and decorations.

The Turkish baths at Lincoln-place are being proceeded with, after plans by Mr. Barter. Mr. Meade the builder.

Reviews.

Headstones, Tombs, and Monuments. By D. A. Clarkson, Architect and Sculptor. London: Atchley and Co.

Nos. 4, 5 and 6 of this work have reached us, and our previous opinions expressed at p 44 are confirmed by further examination. In the designs for "monumental slabs," especially at plate xx., several pleasing and novel features are introduced. Again we must remark that Mr. Clarkson, in his designs for headstones and slabs, is happier than in those for the tombs, though in the latter department also much variety is to be met. *All*, however, are boldly treated, and evidence a desire on the part of the author to step out of the beaten path usually preserved by our modern monumental sculptors.

The Book of Ornamental Alphabets, Ancient and Modern. By F. De la Motte. London: E. & F. N. Spon

THE author's name of this little work has been so long and so favorably known to the artistic world, that any production of his is sure to carry a certain amount of excellence with it; and, evidently with much labour and research, he has not only reproduced from the almost defaced relics in antiquarian collections the varied and beautiful alphabetical and numerical characters of the ancients, hitherto regarded by many as unmeaning hieroglyphics, but has added a series of original and beautiful designs in various styles for complete alphabets, initials, numerals, monograms, crosses, &c. The British Museum, the Vatican, the Bodleian Library, Westminster Abbey, &c., have furnished the scrutinizing eye of the author with a variety of specimen characters from the eighth to the seventeenth century, and the styles comprise Anglo-Saxon, Embroidered, German, Gothic, Church Text, German Arabesque, metal ornamental, &c. Those would-be mediæval alphabet designers of the present day who, by way of novelty, twist and torture letters into an almost inconceivable variety of shapes. and embellish them with fantastic ornamentation, so as to puzzle the most accustomed reader as to their intended meaning, might with advantage take a few wholesome lessons from this little work in the *true and legitimate* principles of artistic design. Its worth, combined with its cheapness, must command extensive patronage. No draughtsman, painter, engraver, lithographer or carver should be without it.

Miscellaneous.

GURNEY'S PATENT STOVE.—This invention, which is being manufactured, and has been supplied by the London Warming and Ventilating Company to several public buildings in England, as also to the Royal Dublin Society, where it may be seen in working order, consists interiorly of a plain cylindrical stove, having doors for supplying fuel and withdrawing ashes, also a connecting open with a flue which may be placed either horizontally or vertically as desirable; but exteriorly it has a number of vertical projections which serve to augment the heating surface considerably, thereby rendering the action of the apparatus many fold more efficacious than ordinary stoves, of similar dimensions. It is seated in a receptacle for water, caused by the heat from within to evaporate, and give any required temperature, which, being produced by the combined action of air and water, is stated to be free from the aridness so generally objected to where apartments are heated by hot air only. A stove value £8 will effectually heat a building containing 10,000 cubic feet, but the invention is applicable to suit any greater dimensions, and the cost is proportionately calculated. Mr. Bunning, the city (London) architect, and well known as an *authority*, has testified to its efficiency. Mr. John Maguire, of Dawson-street, ironmonger, is the agent.

ANOTHER IMPROVEMENT IN NAVIGATION.—A gentleman of Boston, who is a practical machinist, is constructing a steamer upon a novel plan, by which he proposes to attain a speed of thirty or forty miles the hour. He has made experiments with a model on a small scale, which were very successful, and he is now building one sixty feet in length, to further test the practicability and value of the invention. He relies on both air and water to obtain his propelling force; with machinery in the stern of the vessel, upon the propelling principle, to obtain a speed of twelve miles an hour, which, he says, is the highest rate that can be realized from that agency. In the bow of the vessel, and worked by the same engines, he places an apparatus something like the wings of a wind-mill, which is to make 560 revolutions a minute, and by its action upon the atmosphere, will pull the vessel along, he calculates, at a speed much greater than has heretofore been attained.

ARCHITECTURAL ARTISTS IN LONDON.—Unlike Dublin, there is a distinct class of gentlemen connected with the architectural profession in the great metropolis, who are generally know as "Architectural Artists," and whose particular province in the preparation of finished drawings is their embellishment, whether in plain sepia or Indian ink tints, (whereby some very beautiful effects are produced by a skilful hand), or in a variety of colours, with skies, foregrounds, &c; after the outline has been furnished by the draughtsman. Many of these gentlemen are draughtsmen likewise, and prepare geometrical and perspective drawings, untouched by colour, and frequently etched to imitate line engravings, with marvellous accuracy; recently we had an opportunity of visiting the studios, as also of inspecting at the Architectural Association, the works of some of these artists and were highly pleased at the exquisite and effective finish produced, and the perfect development of features. Without invidiousness to *any*—for we desire to do equal justice to all—we should particularize some recent competition *prize* drawings, prepared by Mr. Connop, 188, Strand; a gentleman perhaps second to none in his peculiar branch. Architects in Ireland embarking in important competitions—and pictures sometimes do contribute to success—can with great facility in this railway age, and under arrangements conditional with the result—have their designs effectively finished on short notice. Possibly we should mention that foremost in the list of architectural artists, are to be found many of *our* countrymen, so that we may not incur censure for counselling a preference to strangers and rejection of *our own* equally competent.

THE ST. HELEN'S GLASS WORKS.—Messrs. Pilkington, the proprietors, are the largest manufacturers of crown, sheet, patent plate, rolled plate and coloured glass in the world.

Of rolled plate glass, they manufacture weekly 15,000 superficial feet, or 20 tons; annually 78,000 superficial feet, 1044 tons; of shades and miscellaneous articles 3500 superficial feet, or five tons per week; 182,000 feet, or 244 tons annually; weekly summary 252,000 feet, 150 tons; annual summary 31,104,000 feet, 8106 tons. Of crown glass 148,800 feet, or 72 tons weekly; 7,737,602 feet, or 8742 tons annually; employing 1350 hands at the weekly wages of £1050, or £56,600 per annum; the weekly consumption of coal being 1700 tons. Of sheet glass the annual manufacture was 4,596,400 feet, or 3071 tons. The whole of the glass works employ 4077 hands, use 3710 tons of coal weekly, or 192,920 annually, and pay in wages £3099 weekly, or £161,148 annually. In 1853, Messrs. Pilkington alone manufactured 6813 tons of sheet and crown glass, upon which the duty would have been £600,000.

Sir Charles Barry is named the architect of the new Palace of Art in Piccadilly, to be built for the Royal Academy.

THE NEW PATENT BALANCE ROLLING BRIDGE.—We are requested to mention that the inventor and patentee of this new bridge (as noticed at p. 41) is Mr. Michael Kenny, foreman to Mr. Wm. Turner. Messrs. Turner and Gibson, are the proprietors and manufacturers, and have obtained an order from the Board of Works to fix one at the south George's dock, near the Custom-house.

INSCRIPTION ON HOLY CROSS BRIDGE.—Over the following inscription, on the dexter side of this bridge, are carved the Dunboyne arms and crest; and on the sinister side, on a separate shield, quarterly, first and second three lions passant gardant in pale, second and fourth a pheon—crest, a hand and dagger, for O'Brien. This Margaret was daughter of Donough, second Earl of Thomond, and was the second wife of James, Lord Dunboyne. Burke ("Peerage") says that the latter died in 1624; if so, his wife erected this tablet.

DESTRUCTIVE EFFECTS OF RED LEAD UPON IRON.—Mr. Nathan Mercer, F.C.S., after inspecting the iron ship, *William Fairbairn*, the plates of which were coated with red lead prior to her late voyage to Calcutta, observed that the extent to which the iron had been corroded could not fail to attract the attention of the most superficial observer. On a close inspection, he found the red lead coating covered with blisters, from each of which, on being opened, a clear fluid escaped, and left exposed on the surface of the iron a number of brilliantly shining crystals of metallic lead. Mr. Mercer says each blister is, in fact, a galvanic battery in minature, and that, as wherever there is electrical there must also be chemical action, the corrosion is easily accounted for. This action, he says, will continue as long as any red lead remains, and is necessarily at the expense of the iron. He also points out that the "sweat," so well known to every person interested in iron ships, is not, as is generally supposed, salt water, but a solution of chloride of iron manufactured in the blisters. Mr. Mercer considers this sweating is due, in a great degree, to the use of red lead paint in immediate contact with iron; and he recommends, therefore, that it should never be used as a coating for sea-going vessels, unless special precautions are taken to prevent its coming into direct contact with the iron.—*Liverpool Albion.*

IMPROVEMENTS IN THE CONSTRUCTION OF FLOORS, ROOFS, AND ARCHES.—*J. Bunnett*—Dated June 8th, 1858.—Earthenware or dry clay blocks are used with tie-rods and wall-plates, so that the thrust is brought in each case to act on the tie-rods and wall-plates, the several blocks being so formed as to over and underlap each other. The wall-plates are made of angle iron, and are tied together by tie-rods at intervals. The tie-rods should pass through the blocks, such blocks being made hollow with that view, as well as to obtain lightness. The two sides of each block are each composed of two parallel inclines, each about half the depth of the block, connected by a horizontal, or nearly horizontal plane, and the two inclines on the one side are parallel with those on the opposite side.

A NEW RAILROAD CONTRIVANCE.—The Connecticut River R. R. Company are making experiments with a passenger car, whose propelling power is a small steam engine, stationed in the forward end. The car will seat forty passengers, and the apartments allotted to their use is entirely separate from the engine room, and perfectly free from any annoyance therefrom. It is intended as a desirable and economical arrangement for short distances.

THE GREAT EASTERN.—About five-hundred workmen of various departments are now employed on board this noble vessel, and as the necessary funds are now available, it is confidently anticipated that she will be completed by August next.

THE VICTORIA BRIDGE, MONTREAL.—This great work has been pushed forward so energetically, that the bridge will probably be opened for traffic in October, 1859, instead of January 1, 1860, in accordance with the contract terms. The past season 3,281 men were employed in its construction, including 450 men employed at the Canada Works, Birkenhead, in making the tubes. Five steamers, 63 barges, 21 scows, and 27 ferry and row-boats, 143 horses, 3 locomotives, 17 pumping, hoisting, and stationary engines, 2 rivet-making machines, and 2 riveting machines. were employed on the work. The total length of the bridge over the St. Lawrence is two miles, less 150 feet.

A new Academy of Music is about to be erected at Brooklyn, the contemplated cost being 150,000 dollars; and the Cincinnati Opera House, in course of erection, will occasion, before it is finished, an outlay of, according to the *New York Herald*, not less than half a million dollars.

The monument to Commodore Perry is to be of fine white marble, the pedestal to be eighteen feet high, and the statue of the hero seven feet, making a total of twenty-five feet. Its expense will be 6,000 dollars, to be paid by the city, private subscriptions of citizens, and by the proceeds of the sale of a large lithograph, printed in colours, just received from the establishment of Sarony, Major & Knopp, New York.

A fountain, to be called the "Calder Fountain," intended for a memorial of the late Captain Calder, has been erected in Queen-square, Belfast, from the designs of Mr. Smith, Engineer to the Harbour Commissioners. It will contain a drinking fountain for the use of bipeds, and a trough for the use of quadrupeds The expense of the latter will be defrayed by the Harbour Commissioners, and the Water Commissioners will supply water for both gratuitously.

The house in which Corneille was born in the Rue de la Pie, in Paris, has been recently taken down for the purpose of carrying the street in a straight line. On a spare piece of ground, a little in rere of the spot on which the house stood, a small building has been erected, with a tablet in front, indicating that it was formerly the site of the house in which both the Corneilles (Pierre and Thomas) were born.

The Cork Gas Consumers' Company have purchased the works and interest of the United General Gas Company for £26,000.

To Correspondents.

R. P. (Through some mistake your name was omitted from subscription list); W. T. M. jun., Belfast (We are willing to abide by the agreement made; we shall answer your note in other respects, either personaly or by letter, probably before this reaches you); Subscriber, Longford (We have received several such complaints, and can only attribute the cause to Post-office irregularities, as we know your paper was duly posted); T. and Co., London (Far under a remunerative mark, but nevertheless willing to give a trial, certain of obtaining appreciation and better terms hereafter;) E. A. M. (Too late for this No.—available for June—biography would be inserted.)

ENLARGEMENT OF

"THE DUBLIN BUILDER,"

OR

Irish Architectural, Engineering and Mechanics' Journal,

PUBLISHED ON THE FIRST OF EVERY MONTH.

ESTABLISHED JANUARY 1, 1859.

The Proprietor of "THE DUBLIN BUILDER," yielding to the request of many of his valued supporters, and grateful for the unprecedented amount of patronage extended to his Periodical, even in its infancy, has increased the size from

SIXTEEN to TWENTY-FOUR pages, WITHOUT EXTRA CHARGE.

By this means he will be enabled to devote a larger space than heretofore to ADVERTISEMENTS, as well as to Reading Matter, and to secure insertion, without fail, for several favours hitherto unavoidably omitted, in consequence of limited Advertisement space.

The attention of ENGLISH, SCOTCH and IRISH MANUFACTURERS, Machinists, Civil and Mechanical Engineers, Patentees of Inventions applicable to ARCHITECTURAL, ENGINEERING, BUILDING and SANITARY Purposes, &c., &c., is earnestly directed to

"THE DUBLIN BUILDER,"

AS A MOST DESIRABLE ADVERTISING MEDIUM,

Commanding as it does instantaneously and extensively throughout the United Kingdom, but Ireland especially, the numerous classes for whom such Advertisements are intended.

RATES FOR ADVERTISING:—

SIXPENCE each for first three lines, and THREEPENCE for each succeeding line—large type counted double. Double and treble column Advertisements charged proportionately. Discount, varying from 5 to 15 per cent, allowed, according to the length of order.

Accounts furnished Quarterly, unless otherwise specially arranged.

N.B.—APPROVED WOOD BLOCKS OR STEREOTYPES INSERTED.

Yearly Subscription, 3s.; per post, 4s. (payable in advance).

Communications addressed to the Proprietor and Editor, MR. JOHN J. LYONS, Architect,
17, LOWER GARDINER-STREET, DUBLIN,
Shall receive immediate attention.

The Dublin Builder.

VOL. I.—No. 6.

BUILDERS' ESTIMATES—BILLS OF QUANTITIES.

IT is a matter of much importance to architects, their clients, and builders, that every reasonable facility should be afforded for the preparation of estimates in competition. We are often startled (and how much more so must the public be?) by the widely different amounts of tenders for works of apparently the most simple and straightforward character; which to the non-professional must proclaim some builders look forward to an enormous margin of profit, while others must be *de facto* totally ignorant of one of the most essential qualifications of their avocation, namely, the means of calculating the different quantities in detail of their estimates. Either or both may be true to some extent; probably some builders who may be called upon for tenders have at the time a reasonable amount of work in hands, and are therefore not anxious to incur the expense of paying a surveyor or infringing upon the already fully occupied time of their clerks in taking out quantities on a remote chance of success; they, therefore, by the short process of cubing the dimensions, arrive at an amount which is certain to cover all possible contingencies; while others—and there are some, we regret to say—are so utterly heedless of consequences that if they do trouble themselves with quantities at all, are sure to do so by a process known only to themselves, substituting guess work for all established rules, and setting down gross sums in minimum for the different headings of items which should be entered upon in the fullest details. Both of these are highly injurious, and subversive of all confidence in builders' prices, and consequently the builder who has laboriously devoted himself to, or expended his money upon, ascertaining the quantities, and has priced each item at the most reasonable percentage, is looked upon, if not with distrust, at least with suspicion.

There are other instances where enormous differences arise in tenders, which may be attributed to the prospect of obtaining extra works, sending forward a proposal twenty per cent. under cost price, at the same time fully aware of the chances of we will not say of victimizing, but charging at a high rate the proprietor on additional works, which the far-seeing contractor knows must follow, or through the more objectionable means of obtaining loopholes in the architect's specification; these latter instances, we rejoice to say, are "few and far between."

Again, we can trace these differences occurring from inexperience on the part of young building practitioners, and again in a few instances from want of proper description in architects' specifications, some of which from their very verboseness are ambiguous, and others which merely state, in describing the most important portions of their works, that "they are to be done in a proper and workmanlike manner," without even a hint at the minutiæ of detail.

We have had specifications placed in our hands, where lead (always an important item) is described as "to be laid with sufficient drips;" and where gutters are of considerable length to their outfall, this can hardly be deemed data for the intending contractor. Copper we have met with as "to be laid with proper laps and standing combs," and slating "with sufficient cover." We have sometimes, too, although rarely, met specifications which conclude with the ultimatum, "the works to be finished and completed in every respect and with every necessary, whether mentioned in this specification or not"! Now it is quite clear that each and all of these can be interpreted differently by different builders, and so cause very considerable variation in the amount of tenders.

As an efficient remedy for this state of things, we would recommend (what has already been suggested by those who feel most interested) the adoption, in all cases of competition, of bills of quantities prepared by experienced surveyors, accompanied by clear and detailed description of the works to be executed; every builder applied to for a tender being furnished with a copy, and the charges defrayed either by the proprietor or the successful competitor, as may be previously understood, although, in our mind the proprietor, who is seeking information and reducing the cost of his outlay, should not allow it to interfere with the builders' profits. To some extent this practice has been adopted in England, and, generally speaking, with good result, as architects can in all cases discriminate, and advise their clients accordingly, as to who is and who is not the bona fide contractor.

In order to render the supplying of bills of quantities properly effective, and to remove entirely the idea of favor beyond the reach of question, which possibly never exists except in the imagination of the unsuccessful competitor, the quantities themselves, as well as the description of works, should be delivered, printed, to each intending contractor; the several amounts of tenders can then only vary in the pricing, which can hardly extend to their present range.

While upon this subject, we would merely allude, *en passant*, to the new regulations which are in process of issue from the War Department. We are glad to see a change made in those days of improvement which will enable all builders who are fairly inclined, to become contractors for ordnance works. Personal security is not required, and that security which should alone be demanded in building contracts, namely, a sufficient per centage from instalments upon all works executed, will in future be the rule. In our next Number we shall be enabled to lay the matter more fully before our readers.

PAPER WATER PIPES.—Water pipes have been made of almost every conceivable material—wood, metals, gutta percha, india rubber, stone ware, glass, &c., but paper pipes are novelties. The new pipes, a Parisian invention, are made of paper dressed with bitumen; they are capable of resisting a pressure of fifteen atmospheres, and made to bear much more by increasing the thickness of their walls. They are, of course, very light, very homogenous, inoxidable, perfectly wholesome, and remarkably cheap. The bitumen is mixed with a certain quantity of chalk, not given, and is heated in a boiler to melting; a roller of paper is then made to pass through the liquid bitumen, and immediately afterwards it is rolled upon an iron mandrill of the size desired for the interior of the pipe, to the thickness required. When this is done, the mandrill is placed in another cauldron, which contains pure bitumen, and afterwards rolled upon a flat stone sprinkled with fire; the mandrill is then drawn out, and the inner surface of the pipe dressed with pure bitumen. These pipes are four times cheaper and five times lighter than cast iron. Joints are made with perfect ease, and altogether this novelty promises to be useful.—*Scientific American.*

ON THE ANCIENT ARCHITECTURE OF IRELAND.

THOSE specimens of Gothic or pointed architecture, of which Ireland possesses any remains, have, with very few exceptions, been derived from England; and from various causes, the best works of that kind which we do possess, are greatly inferior to the ecclesiastical architecture of the latter country. Their history, too, in many instances must necessarily be obscure and uncertain. All the monastic archives and annals in these countries suffered great, too often, wanton spoliations. Besides these difficulties, it does not appear to have been the fashion of those remote times to have recorded much information connected with the foundation of those buildings, so that a chasm occurs in their history which conjecture will very imperfectly supply. As to the architects and builders actually employed in these erections, nothing certain is known.

From a recapitulation of what has been already advanced, it will appear that at the termination of the Roman empire in Britain, France, Germany, Italy, and even in the East, the Roman buildings were imitated by the natives of those respective countries, or by the rulers, whose sway over them succeeded the Roman government. This imitation produced a general similarity of style in their architecture, between nations very remote from each other. Every copyist varied a little from his model, and the imitations differed greatly from each other; but some general principles indicative of their source pervaded the entire, and might be traced through them all. In Britain these imitations were called Saxon; in France, Norman; in Italy, Lombardic or Gothic; and in Greece, Constantinople, and the eastern provinces, Byzantine.

With respect to Ireland, as she had never suffered under the tyranny and degradation of Roman subjugation, neither did she in those early times reap any of the advantages which the refinement of Roman arts and manners had diffused, more or less, among the other nations. Her architecture, therefore, until her conversion to Christianity was, if I may use the expression, in a state of nature, being little, if anything improved by the casual intercourse of the Irish people with that once powerful and, at least comparatively, civilized empire.

If such be her state in the nineteenth century, why may we not, without much stretch of fancy, suppose a similar state of inequality of condition upwards of a thousand years ago? This supposition would at least solve the paradox which has puzzled many of our speculative philosophers, who cannot believe, and therefore treat as fabulous, those glowing pictures of ancient Irish splendour which Irish writers blend up with the simple manners of those early ages.

But to return from this digression. When new colonies introduced improved manners and new arts, domestic buildings would naturally improve; but their progress must necessarily have been slow and almost imperceptible. Until the introduction of Christianity, the national religion did not require any covered or enclosed building in which to celebrate their solemn rites. But when Druidism became exploded by the conversion of the people, the new proselytes would of course endeavour to imitate the churches which their instructors described as existing in other Christian countries. We may go beyond hypothesis in this matter, for the fact is, we know that the first care of those pious apostles was to build churches either of wood or of stone for their new disciples. These were evidently, at first, very rude and homely structures, as we may perceive by the remains of many which carry with them, even to the present times, innate evidence of great antiquity.

It is not easy to determine which of those structures that have descended to our time is the oldest, nor is it necessary to do so in our present inquiry. Most of them are peculiarly rude and unfinished, as far as neatness of workmanship comes under such a definition; but of a soundness of material and cement, where cement has been used, that may defy, in point of durability, the best specimens of building at the present day.

Coeval with these structures, or according to General Vallancy, much more ancient, are the *Turres Ecclesiasticæ*, or round towers. It is not the present purpose to speculate on the use of these lofty buildings, but we will assume that they were erected merely as steeples to the churches to which they were attached. If this supposition be correct, their erection must have been posterior to the erection of belfries or campanies, which Dr. Ledwich and some other writers limit to the eighth or ninth century. Whether in this statement they are right or wrong I will not pretend to say. Perhaps if these towers be more ancient, we must adopt the theory that they were, previous to that invention, used as minarets are at present among the Musselmen. I can hardly bring myself to think with General Vallancy, that they were Persaic structures, dedicated to the fire worship of the sun. For my own part I see no reason to doubt of their being Christian edifices, built immediately after the introduction of Christianity. Bells were invented, or rather in use, so early as the fifth century; and I imagine no good cause can be shewn, why a belfry should not be an equally ancient appendage to the church. If, however, we adopt the General's hypothesis, we need set no narrow bounds to our imagination; for in that case, we may date their origin as early as we please. Some writers imagine that they were penitentiary towers, the habitation of certain recluses called "Inclusi, or Cellant," erected in imitation of the pillar of St. Simon, the Stylite, as he is called, of Syria. It was a favourite opinion of those who advocate his theory, that the penitent, as he grew in grace and sanctification, ascended higher in his tower, storey by storey, till he reached the summit, in order to hold a closer intercourse with the skies. Others assert that the penitent at first took his station at the top, and descended by degrees as his sins were remitted, till, on reaching the door, he obtained complete absolution, and was received into the body of the church by the officiating priest. The learned Harris and Dean Richardson were of this opinion; and Dr. Milner, adopting it on their authority, says—"it is impossible to show what other purpose they were calculated for, and that it is equally impossible to discover the vestiges of any other *Clusoriæ* in the neighbourhood of the great churches."

From this theory, though upheld by such learned antiquarians, I must venture to dissent. Dr Milner seems to forget the existence of such "*Clusoriæ*" as the stone-roofed cells at Killaloe, Kells, and elsewhere, which were as obviously suited to the purpose as the towers; besides, cheaply as labour in those days could be procured, one of these towers would cost too much to the monastery, or the district, or whatever other community, civil or religious, might be then in being, to be thus devoted for the exclusive salvation of an individual, to the prejudice of many hundred pious souls, equally ardent in their aspirations, after such superior sanctity and mortification. It is equally unlikely, that the insulated individual who had made a vow of poverty, could, from his own resources, or by his own exertions, erect such a pile for his own use.

The ascetic life held forth, or was supposed to hold forth, too many advantages to the numbers who embraced it, to permit the dispension of those benefits to be limited to so few, as all the Irish towers together could accommodate I can see no way of getting over the difficulty, except by supposing, that the virtue of the Anchorite's prayers and austerities was communicable to those who acquired an interest therein, by contributing to his support; and who, in this way, were enabled to enjoy the merit of these austerities, which, it may be said, they thus performed by proxy. In this view, no sacrifice of expense would be too great in return for such advantages. It is, however, very possible, that the fanatic zeal which suggested such voluntary mortifications, would also occasionally suggest these towers, if previously in existence, as very convenient retreats wherein to perform them; and to the solitary recluse, the steeple tower would afford as comfortable a retirement as the cloistered cell. But whatever might be the uses of those towers, or for whatever purpose erected, in their masonry, which is, at present, our principal object, they rival the best specimens of church building in their vicinities, though many of those churches appear of a different, and frequently of a more recent kind of workmanship. Their rotund figure has not only tended to their durability, but proves incontestably that the art of masonry had then attained a considerable share of perfection. To build to such an immense height, with rude stones—to give these towers the circular and taper form, which most of them present, and to have their durability so well ascertained, as it has been to us, devolves a degree of skill, and a perfection of art, for which, supposing churches and round towers the only stone buildings then in use, we can hardly account. The practice those masons would require to become expert at their business must, in my estimation have been much more extensive. It may also be fairly questioned, whether the best builders of the present day could erect a tower of similar dimensions and materials, which would last half their term.

The best opinion we can adopt as to their dates, is to suppose them the work of different ages; and, accordingly, simple as was their form, we find various fashions prevail in their construction, and often a greater difference in the material of which they were built. In many of them the doors and windows are quite square, without the least approach to the arched form; in others, the doors are circularly arched and some of them assume the form of the Gothic pointed arch; so that without any abuse of the term, the round towers may be classed among our earliest Gothic structures.

From all these circumstances an attentive observer will perceive the gradual progress of the Gothic style of architecture, in its amalgamation with the original architecture of the country. Through this union, it was certainly at times debased by the mixture of the ruder alloy of the native architecture; and by this means operating with other causes, the Gothic style was prevented from attaining that perfection of which it was susceptible, and which it did attain in England and other countries, more wealthy, or more happily situated than our own.—*Thomas Bell.*

It is said that a valuable freestone quarry has been discovered in Killough, on the property of Lord Bangor. Lord Bangor has set a number of men to work it, and it is confidently expected that it will afford work for a considerable number of hands.

MODEL DWELLINGS FOR WORKING MEN.

THE operations of the Society for Improving the Dwellings of the Poor in London, will be best understood by a description of one of their model dwelling-houses for families—namely, that situate in Streatham-street.

A large building, four storeys in height, has been erected. It forms three sides of a square. The upper storeys are reached by open galleries carried along one side the square. In this way all internal staircases save the one by which the galleries are approached, are avoided. The separate dwellings consist of a dwelling-room and two bed-rooms. Each opens by its own private outer door on one of the corridors of the galleries. Suppose we visit one of these dwellings on the first floor, for example. This is covered over head, but open and protected by iron railings, towards the interior of the square. We find a neat outer door with its knocker, and probably the name of the tenant on a brass plate. Knocking, we are admitted into a suite of rooms having all the privacy of a single house or cottage. The outer door does not open abruptly on the dwelling-room—we pass through a little passage, which leads to the door of the principal room. We find it well-lighted, airy, and wholesome; provided with a capital range, with a boiler. In addition, there are two comfortable bed-rooms, one with a fire-place in case of illness. Now we come to some matters of detail, common-place, and vulgar enough, perhaps, but upon which, not only the health, but even the moral purity of the inhabitants may depend. We find an excellent scullery, which communicates with a shoot connected with the basement of the dwelling, and also a means of exit for the dust and refuse, which are immediately carried far away from the dwelling, and the trap being shut down excludes any effluvia which might arise from the distant dust heap. There is also a water-closet well supplied with water. Nor does this enumeration exhaust all the conveniences. We find a closet opening into the living-room, in which a bed may be turned up by day, if the exigencies of the family should require the conversion of the dwelling-room into a bed-room by night. There is also a well-ventilated meat safe. Indeed, no set of chambers could be well devised more conducive to health and comfort. All these advantages may be secured for the small weekly rent of from 2s. to 7s., the majority being at 5s and 6s.—very little more than the poor man must pay in some parts of London for a single room, with no water laid on, save in the bottom of the house, no privacy in things most essential for moral purity. We have, however, not yet exhausted the advantages of our model building There is a well-ordered wash-house in the basement of the buildings By paying to the superintendent of the dwellings threepence, the thrifty housewife who would keep her husband's dwelling free from the annoyance of soapsuds, can secure an unlimited supply of hot and cold water, and all the necessary appliances for washing for three hours. Should her work take her longer, she can procure an additional ticket at the rate of three-halfpence per hour. The spacious area of the interior of the square, formed by the buildings, afford an excellent drying ground, as well as the place where the children may play, secure from the contamination of the streets. When we visited these buildings lately we found them all let, save one or two on the basement or underground floor; which, though clean and comfortable, not being so eligible as those above ground, are let at a cheaper rate. For the best dwellings there are several applicants on the books in case of a vacancy occurring. These applicants, many of them, had produced to the superintendent as a satisfactory testimonial of character the rent-books of their present residence to show their regularity as to paying their rent. We found ourselves welcomed by many of the inmates, who cheerfully, and with honest pride showed us how comfortable they were. One woman made an observation, which called our attention most forcibly to the great peculiarity of the building All the ceilings are vaulted over and rendered fire-proof. She declared that she should be afraid to move into any other building not so constructed, for fear of being burnt out of her home by her neighbours. The collection of so many as fifty-four families in one building affords the society the means of giving their tenants another advantage. A respectable coal-merchant finds that he can profitably supply the inmates with coals at the market price. Those who choose to avail themselves of this, can pay for their coals along with their rent, and thus obtain a considerable boon, with no loss of independence

The cost of this building was £7,370. The rendering it fire-proof, as well as preventing the communication of sound or the percolation of water through the floors by tile arches, hardly exceeded £50 more than the ordinary combustible floors and roof would have cost. The building is erected on ground belonging to the estate of the Duke of Bedford, let for a lease of 99 years, at an annual ground rent of £50. This his grace generously returns as a subscription to the society. We now come to a most important question in a pecuniary point of view. Is the building a loss to the society, or does it pay its own expenses? After deducting all charges for ground rent, repairs, bad debts, agent or superintendent for collecting the rents, &c., we are assured that this model building returns a profit of nearly 4½ per cent. on the outlay. Here, therefore, we have a model dwelling, affording a healthy, wholesome home, in a crowded and valuable portion of the metropolis, to fifty-four families, without in the least compromising their feelings of independence, or rendering them in any degree recipients of charity. It may be said that this percentage is too small for private landlords, who generally look for their 8 or 10 per cent. To this we reply that it is far better than most railway returns. We cannot help thinking that the day will come when parishes, instead of trying to thrust the poor man out of their boundaries, will learn that it would be sounder wisdom to follow the example of the "Society for Improving the Dwellings of the Poor," and erect their own model dwelling-house on similar principles. It would not be difficult to show that the increased healthiness, as well as moral improvement, thus introduced among a few hundred families, would soon make a greater return than 10 or 12 per cent. in diminished poor or death rates.—*Morning Chronicle.*

PARLIAMENTARY TRAINS.

THE Railway Cheap Trains Act received the royal assent in its amended shape. In our number of 15th May last, we gave a report of the case of "Rice *v.* Dublin and Wicklow Railway Company," in which it was decided by the Court of Common Pleas in Dublin, that the company was not entitled to charge parliamentary passengers for fractions of a mile over a complete mile. The company had charged 2½d. for 2¾ miles. The case was governed by the following words in section 6 of 7th and 8th Vict., c. 85:—"The fare or charge for each third-class passenger by such train, shall not exceed one penny for each mile travelled." The act says nothing specially as to fractions of a mile. In the case of the North British Railway, a court in Scotland decided that the company were entitled to charge a penny for a fraction of a mile travelled by parliamentary train, the company having charged 7d. for 6¾ miles. This decision was overruled by the Board of Trade (though they have no jurisdiction in the matter, the fares being expressly excepted by sec. 8 of 7th and 8th Vic., cap. 85, from their powers) the law officers of the crown for England and Scotland having given an opinion to the effect, that the company was only entitled to charge proportionate fractions of pence for fractions of miles.

The Irish Court of Common Pleas decided in the recent case against the Wicklow Company, that they were not entitled to charge such fractions at all; and it follows that they were to carry passengers for portions of miles for nothing. Three different and conflicting interpretations have, therefore, been given to the provision above quoted. On the case being brought before the Board of Trade, Mr. Henley introduced a bill to settle the absurdity arising out of this "beautiful uncertainty of the law." If the company were not entitled to charge for portions of a mile in addition to whole miles, it follows that if the same construction of the same words were applicable, they could not charge for such portions where the distance travelled was under one mile. The Wicklow company have several such cases on their lines (like others running in suburban districts) where the distance between stations is under one mile. Parliamentary passengers of adult age would, therefore, be entitled to a railway journey from one station to another and back again, daily, and in any number, for nothing; and the act says, children are to be carried for half the fare for adults!

Mr. Henley's bill, however, would hardly have made matters better. It would have provided that, "when the distance travelled is a portion of a mile, and does not amount to one mile, or when such distance amounts to one mile, or two or more miles, and a portion of another mile, the fare or charge for such portion of a mile, if the same exceeds one-half mile, may be one halfpenny." What in cases where the whole distance between stations (and there are several such cases on the lines of the company against whom the above decision was pronounced) does not exceed half a mile? The bill, however, upon further representation before it left the House of Commons, was amended as it now stands in the act, which provides, that when the distance travelled by a parliamentary passenger "is a portion of a mile, and does not amount to one mile, the fare for such portion of a mile may be one penny; or when such distance amounts to one mile, or two or more miles, and a portion of another mile, the fare or charge for such portion of a mile, if the same amounts to or exceeds one half mile, may be one halfpenny;" and half for children. The act has also a retrospective clause protecting companies from actions where their parliamentary charges have not exceeded one farthing for each quarter of a mile travelled. The effect is, that the minimum charge for a railway journey is a penny for an adult, and a halfpenny for a child—not a very exorbitant charge for buying land, making the railway, providing engine, covered carriage, plant, and staff; and half this for half miles, where the journey extends half a mile beyond the whole mile or miles. For this satisfactory result of the decision against the Wicklow Company, much credit is due to Mr. Moore, the Secretary of that company, whose lines are peculiarly affected by it, and for the manner in which he has brought the case before the Board of Trade; and Mr. Henley's readiness to remedy an injustice in this instance, when pointed out, speaks well for the fairness with which he is disposed to deal with any real grievance. It has been estimated that "20, 30, or even 50 per cent. of the low penny-a-mile fares" are concerned in the question, it having been the general practice in England, as well as the other parts of the United Kingdom, to charge the halfpenny for half miles or more; and this is now legalized, with the addition that no adult fare is to be under one penny, though the distance may be less than a mile, or than half a mile.—*Herapath's Railway Journal.*

HOW GREAT GUNS ARE MADE AT THE WOOLWICH FACTORIES.

A 68lb. gun, when finished, is 17 feet long, 28 inches in diameter at the breech, and weighs 95 cwt. As guns of this description are cast vertically, and require a "dead head" of considerable magnitude in order to secure sufficient density, it may be imagined that the furnaces are matters of important consideration. In practice it was found advisable to use two furnaces in the melting of a sufficient quantity of iron for the production of one such gun as we have described. The furnaces would each hold sufficient molten metal for the casting of one gun, but as it was not possible to charge with ten tons of pig iron at once, it was found better in every way to charge two furnaces with five tons, and melt simultaneously. The quality of the iron produced in this way was found to be superior to that resulting from one furnace, when a portion of the charge must have been melted first and the remainder afterwards. Repeated tests proved this fact to demonstration, and it is a practical point of much consequence. The furnaces are partly constructed of Stourbridge fire-brick, but the beds are of different material. The throwing in of old "carronades, " dead heads," and "pigs," was found to chip off, or to crack and destroy the fire-bricks, and a substitute for these in the construction of the furnace beds had to be found. A cheaper substance, and one which admits of easy repair, is now used. It is composed of equal parts of glass-grinder's sand and blackfoot sand. The former is the refuse from the Thames patent glass works, and contains a considerable admixture of fine particles of glass, and the latter is obtained from the sand pits at Charlton. These are amalgamated, rammed hard upon the foundation of the furnace, and after the application of heat from a vitrified surface impervious to liquid iron. The sand furnace bed is in point of efficiency and economy immeasurably superior to that of fire-brick, and we recommend it strongly. With respect to the dimensions of the furnaces it may be stated that they are about 22ft. long, from centre of fire-grate to centre of chimney; 5 ft. 2 in. wide; and 2 ft. 6 in. in height from bed to crown. The fire-grate is 5 ft. 2 in. square, and open for the admission of air at the end of the furnace, and the chimney is 60 ft. in height, and 2 ft. 6 in. square. The furnaces are always heated before receiving their charges, and when the latter are sufficiently fluid and hot, the molten streams from two furnaces, as we have stated, are made to flow through separate channels into one reservoir. Here they mingle and blend for a little time in one harmonious whole, so as to equalise any difference of temperature which may have existed prior to their being tapped. Metal is now ladled in small quantities from the reservoir for the purpose of casting testing bars, and a sluice door being opened, the molten ocean courses its way down, river-like, into the centre of the gun mould, which is placed vertically, and muzzle upwards, to receive it. Scoria and other impurities float upwards as the metal rises, and great precautions are taken to prevent their flowing with the iron into the "trunnions," which they would weaken, and thus make the whole casting useless. When the metal reaches to within a few inches of the guide shute, the flood-gates through which it flowed are shut for a minute until the shute is removed, and then again opened for the complete filling of the mould. In cooling there is a great subsidence of the metal, especially in the centre, but the hollowness thus produced is in the dead head entirely, and by no means deteriorates the gun. Every thing is suffered to remain *in statu quo* for about three days and nights after the pouring operation. The mould is then opened and the casting, usually perfect, is prepared by lathe and the boring mill for proving, and mayhap for battle. Such is some account of the gestation and birth of a great gun, which in these non-piping times of war may be acceptable to the public generally, and certainly must be to the scientific reader.—*The Guide.*

BELFAST EXHIBITION OF FINE ARTS.—A highly creditable collection of works of art has been brought together at Belfast, despite the more immediately commercial and matter-of-fact qualifications of the respected townspeople there; and as we had an opportunity of visiting it personally, we can say that, considering available resources, it bears more than a fair comparison with similar undertakings in other towns, and reflects generally much credit on the talents of the exhibitors, and the judicious discrimination of the committee.

BELFAST.

DONEGAL-place, once the abode of the aristocracy, and where two or three still linger, apparently unwilling to concede to the innovations of modern times, is fast becoming a first-class business street. Very recently two extensive mercantile firms opened in their respective lines, after having fitted up their places of business, in such a way that they have materially added to the elegance of the town in the matter of shop fronts, in which we believe Belfast can now vie with any town in the empire of equal magnitude. At present there are no less than four houses on which workmen are engaged in this street. The Bank of Ireland is erecting a new house for their branch here, now about five or six feet above the surface. The new Ulster Bank progresses rapidly, and is from a design by Mr. James Hamilton, of Glasgow. It comprises a union of the Doric and Corinthian orders, and is the second example of such combination in the town—the Ballymena Railway Terminus being the first. The building will be 100 feet square and 78 feet high. In the centre stands the cash-office, which will be a square, spacious apartment, lighted by a large dome of stained glass, supported by Corinthian pillars. The dimensions of this room are, 68 feet by 41 feet, and 83 feet to the ceiling. On either side are apartments for the directors and principal clerks. The structure is two storeys in height, with a basement containing the porter's residence, safes, and stores, arched over by fire-proof roofs. The body of the house is very substantially built of brick, and white stone copings, by the Messrs. Fulton; and under the superintendence of Mr. Moore, who erected the Ulster Arcade. Glasgow freestone, of fine colour and excellent quality, has been used in the building of the front and in the side wings. The entrance will be approached by a flight of steps leading to the portico, which will be supported by eight massive columns of the Doric order. Above these are Corinthian columns supporting entablatures, with Corinthian enrichments. The Ulster Arms will appear conspicuously on several parts of the façade, and the whole will be surmounted by a splendid figure of Britannia, supported on either side by one of Justice, with the balance, and Commerce, with the cornucopia. The carving is by the Messrs. Fitzpatrick It appears to us, however, that it is a great pity such a handsome building should be so disadvantageously circumstanced as regards site, and we should have much preferred seeing it in a wider and greater thoroughfare. Tho Messrs. Riddel, of High-st., have taken extensive premises, which run out into Fountain-st., to which, when completed in a style of splendour unknown to our forefathers, they intend, we hear, to transfer their business. Messrs. Ewart and Co. are also putting in a new front into their premises; and fourthly, what was until now a private dwelling-house, is being converted into a shop for an apothecary. Various other buildings in the town and vicinity we hope to be able to notice in our next.

STREET ARCHITECTURE.—An extensive establishment has just been opened by Telford, china and glass warehouseman, at No. 50, Henry-street. It is named "Telford's Crystal Palace," and certainly the appellation is most appropriate. The progress of an improved style of street architecture, particularly as far as it relates to shop fronts, is becoming every day more general through the city, and amongst the most attractive of those and most suitable for their purpose is the front of the establishment of the Messrs. Telford. It is exceedingly rich and ornate without being overwrought or gaudy, and is admirably adapted to show the articles offered for sale to the best advantage. It consists of two of the largest squares of plate glass to be found in any window in Dublin, erected by Messrs. M. Brookes and Co., Sackville-place. Within these windows oblong panels of polished mirror, of great size, are placed, which produce a fine effect, and in the centres of the window spaces two richly ornamented chandeliers are fixed The external decorations are carried out with much taste and sound judgment. The interior of the establishment consists of a vast apartment 150 feet long by 88 feet wide, and brilliantly lighted from the roof.—*Abridged from the Freeman.*

NEW PROCESS OF PAINTING.—M. Andrew, an old engraver of Paris, now living in retirement at Braine, has made known a new process of painting, the invention of which is the result of numerous experiments made by him since the commencement of the year 1855, when he first directed his attention to the subject. His process consists in the employment of a sort of pastel paint, which, according to the preparation used, produces the appearance of all kinds of painting known, as oil, water-colour, crayon, varnish, enamel, at the pleasure of the artist. It may be added that this new process is executed with a rapidity of which no other style is susceptible, except, perhaps, the large water-colour. Those who have inspected the pictures produced by M. Andrew through his new process declare that the imitation of crayon drawing is perfect—that it displays the softness and freshness which is the charm of that style, and that the imitation of water-colour and oil-painting is so excellent as almost to deceive the most attentive examination.

SANITARY CONSIDERATIONS.

SEWERAGE—NO. IV.

WHETHER or not it be a fact that "the Board of Health slew its hundreds at Croydon by Sampson's weapon," as facetiously remarked after Mr. Chadwick's speeches had accomplished the establishment of the Board of Health system, and thereby fixed a fearful fever in the town—it cannot be denied that the fever came, and that hundreds died, also that almost every house, with respect to which the system had been adopted, was visited by death or sickness, and that the three houses whose privies were left standing, escaped without evil. These are all facts, which the elaborate reports of Dr. Arnott and Mr. Page have put beyond doubt, and which are well worth the study of those who profess to lead in sanitary improvements. The system was, in fact, an utter failure, though bolstered up for years by government subsidy, and written and spoken up by one whose "*cacoethes scribendi*" was only to be equalled by his "*cacoethes loquendi*," and who was designated in the debate in the House of Commons upon the Croydon question, "the greatest pest that society had ever met." We, of course, pronounce no opinion on the latter question—we merely chronicle facts, and point to realities which deeply affect the *quæstio vexata* upon which we write.

The *second* of the three propositions for sewerage improvements to which we have alluded, is one which has attracted much attention. About the same time, Mr. Wicksted and Mr. Dover suggested that the evil of discharging the solid or excrementitious matter of sewers into rivers, might be obviated by collecting the whole at the sewer's mouth, separating the solids from the fluid, and converting the former into a manure, which, calculating upon the constituents for fertilization known to exist in night-soil, was shown to be a fertilizer of the most valuable description.

Almost simultaneously with the original efforts of these gentlemen were those of another, Mr. Moffit, who, adopting or conceiving the same ideas, determined to put the scheme into operation for private advantage. He leased from the Corporation of London a very well known place called "Puddle Dock," where ships discharge, but into which also discharges a main sewer, supplied from an immense district, and which gave name to the dock in question—for it contained, not water, but *puddle* of the foulest kind. Just in proportion to the intensity of its filth, so, it appears thought Mr. Moffit, would be the immensity of his fortune. In the ratio of the foulness which assailed his nose as he snuffed up the odours from the sewer's mouth—the sweets of which he coveted to possess—his imagination pointed out the extent of his riches. In the inkiness of the matter which exuded from the sewer, he only saw the brilliant gold into which it was to be turned; and, like a prudent man, he said, "Let Mr. Wicksted and Mr. Dover hold forth to the public upon the public good they propose to effect; I'll say nothing about it, but take a lease from the Corporation of all that flows into Puddle Dock, and that which now runs to waste, I'll run into ingots of gold."

Accordingly the lease was taken, and, at a cost of several thousands, he established works at the sewer mouth to make his fortune. *His* operation and Wicksted's and Dover's were alike in principle. The whole matter of the sewer was pumped up into tanks, or drawn into them by Archimedian screws. There it was acted upon by what, in scientific jargon, was termed "*milk of lime*," otherwise an admixture of lime and water, analogous to whitewash. The chemical action quickly precipitated the whole of the solids to the bottom, thus enabling the fluid to be drawn or pumped off, leaving the deposit to be dried by any means devised, and which deposit, as before stated, was to be sold as a manure.

So far as the collection of the solid matter, the action was perfect—it was quickly precipitated and readily collected; but there is little more can be said of the arrangement, either as a sanitary measure or a commercial one.

In a sanitary point of view there was nothing to remedy the evil of sewers, within which—not at the sewer mouth—is the wrong committed. From the sewer mouth, no doubt, comes abundant filth, discharged in London into the river at some 80 or 100 different points, each of which locality suffers, as well as the river itself. But the real wrong arising from the sewers is, the never-ceasing emanation of noxiousness from every inch of every sewer throughout every street in the metropolis. That noxiousness either forces its way back into the houses through the closet-pipes, into the streets through the gulleys, or into the subsoil, to lie there pent up until the surface is opened for repair, when it is given out in a most deadly shape—its virulence being greater or less in proportion to the time it is held within the soil, feeding, it may be said, upon itself until it becomes an essential essence of deadly poison. It is never destroyed so long as it is so pent up, and cannot be, until diluted by the atmosphere, or burned.

As a sanitary measure the proposition was, therefore, specially defective. It, no doubt, would save the river from pollution; but the land would be still impregnated, and the atmosphere filled, with poison.

As a commercial measure it was also fallacious and without true foundation, as we shall now show.

The leader of the Board of Health, Mr. Chadwick, had about this time become a director and the mainstay of a company formed upon the Chadwick theory, designated "*The Metropolitan Sewage Manure Company*." Its object was to supply the neighbourhood of London, "for 50 miles round," with the liquid sewage matter of the metropolis—to be conveyed in metal pipes for that distance, in the first instance, and then over the farms, by means of mains running through or round each farm. About as baseless a scheme as ever was proposed. First, because no known power of hydrostatic or hydraulic law affords the means to drive such matter through a pipe of 50 miles in length; and next, because the cost to convey it, if it were possible, would far exceed the advantage to be obtained. But Mr. Chadwick was the *godfather*, and no little band of little ones at a christening ever ran more anxiously after the dispenser of the cuts of cake, than the grown children of London ran for the shares of the company, till they gorged themselves with slips of parchment representing money to the value of some £300,000. Every share was taken up, and every shareholder was taken in. He was to make a fortune. Out of, as was said, "*What do you think?*" That was the beauty of the thing, and that was what put Mr. Chadwick upon the pinnacle he then occupied. All the filth of London was to take excursions every morning into the country, there to be converted into "golden grain;" whilst the operation was to put millions of gold into the fortunate speculators' pockets. Yes, millions! This was *such* a novelty; and as it was made so clear that every shareholder would be a contributor towards his own fortune, the success was complete, and the money got.

A most elaborate calculation was gone into, founded upon the analysis of night-soil. It was demonstrated that the weight of matter yielded from each adult, in 365 days, averaged 10 cwt.—that the fertilizing constituents of this matter gave, at the market value, a sum not less than £1 per head, and that, therefore, the money value of the human refuse of London was, at that rate, arising from three and a-half millions of people, three and a-half millions of pounds per annum!!!

It was no wonder the shares of the Metropolitan Sewage Manure Company ran up. Mr. Chadwick was then the *alpha* and *omega* of every sanitary move; and it was no wonder that poor Moffit ran mad, or next to it, on the value of the Puddle Dock. We say it is no wonder these things should have occurred, because the periodical insanity of the people of London is a matter of history; but we can scarcely imagine a more transparent hallucination if the propagators believed, or a more transparent humbug if they did not.

That poor Moffit believed, there is the most convincing proof. He spent all his own money upon the speculation, and then involved himself, as is known, to the amount of many thousand pounds.

Now let us trace the fallacy to its source.

It is quite true that excrementitious matter—urine and fœces combined—in the original state, contains the elements of nutrition for plants, equal to the money value, perhaps, of 12s. or 15s. per annum for each adult; which is, in all conscience, quite enough to show the millions and millions of value now lost to the country by its waste.

But the process of deterioration produced by the existing sewerage system was not taken into consideration. It was assumed that because the matter possibly reached the sewer, containing the fertilizing matter as stated, that it retained it till it was discharged at the sewer mouth.

So far as we can trace, the only opposition offered to that doctrine at the time is to be found in Mr. Jasper Rogers's publication, of 1849, "Sanitary Reform." In that we discover the following passage:—"Permitting the excretary matter of cities to be driven into public sewers with the hope of using it and the surface and other waters as a liquid manure, entails upon the operation a drawback which cannot be compensated for; because, even if it be possible to force it 50 miles around, by some means that science has yet to discover, it will contain, on the average, *perhaps but 5 per cent. of nutriment for plants.*"

Here is the key of the fallacy. It is evident, however, that Mr. Rogers's views were not heeded. If they had been, so egregious a scheme could not have been effected; but it must be plain to common sense, that if the matter arriving at the sewer mouth only contains five per cent. of fertilizing ingredients, that it was either gross ignorance which based the return of profits on the original constituents of the matter found in it before it was discharged into the sewer, or gross deception. These appear to be the two horns of the dilemma, one or other of which Mr. Chadwick, Mr. Dover, and Mr. Wicksted must impale themselves upon—it must be either.

It has been since incontestibly established by a government commission that the fertilizing matter discharged at sewer mouths is about the quantity stated by Mr. Rogers in 1849; but some eight or nine years were allowed to elapse before the influence of the old Board of Health was so far neutralized as to permit that public investigation. In the interim the evil had been accomplished. It appears clear enough to common sense, that from the moment excretary matter reaches the sewer, it must, of necessity, give out its fertilizing properties. The action of the air and water decomposes it as it floats along or deposits itself at the bottom or sides. The gaseous emanations from the sewers proves the facts which simple reason points out. But reason or common sense was not permitted to act until ruin came.

First, Mr. Moffit's speculation totally failed, and was ruinous.

Next, Mr. Dover's.

Then came the utter failure of the Metropolitan Sewage Manure Company. It could neither pump its matter away "for 50 miles around London," nor find in the matter sufficient elements of nutrition, and, as a last resource, the sewage was filtered through "Rogers's patent peat charcoal," and sold to the farmers round as *a solid manure.* On our last visit to *Stanley-bridge* (about two years since), where the company's *liquid* sewage works are established, we saw there a large quantity of this *solid* manure for sale.

Lastly came the result of the operations established under Mr. Wicksted's care at Leicester. Above £50,000 was expended—very ingenious machinery erected to deposit and collect the solids of that town *at the sewer mouth.* The entire arrangements were made on clever and scientific plans, and *the water of the river relieved from contamination.* But the sewers themselves were left as noxious as ever, and the manure produced was found to be of so little value that it would not pay for the lime required to deposit it; whilst it has been fully proved that the action of the lime upon the excrement during deposition is to disengage and discharge from it all its ammoniacal matter. In short, the proposition has proved itself to be fallacious, and if anything were necessary to establish that fact, the debate upon the subject, held at the Society of Arts last season, is sufficient.

In our next number we shall describe the third, or *peat charcoal* proposition.

SOCIETY OF ANTIQUARIES OF SCOTLAND.—Seventy-ninth session.—The Society of Antiquaries of Scotland met within their Hall, No. 24, George-street, upon Tuesday at 3 o'clock, p.m. The following members were admitted:—Robert Hutchinson, Esq., proposed by the Rev. W. Stephenson, D.D.; J. Paton, Esq., proposed by Wm. Fraser, Esq. The following communications were read:—A paper on the subject of Burns' pistols, recently presented to the society; by the Right Rev. Bishop Gillis. Remarks on the Round Tower at Abernethy, with drawings; by R. R. Brash, Esq., architect, Cork. Note of a Styca of Osbercht found near Jedburgh; by John Alex. Smith, M.D., F.S.A., Scotland. The following donations were received from His Grace the Duke of Northumberland, K.G.:—Surveys of the Roman Wall, and other remains in the north of England; by the Rev. Henry Maclauchlan, made by the direction of the Duke of Northumberland. Memoir written during a survey of the Roman Wall. By Rev. Henry Maclauchlan.

WATER FOR THE CITY.

A LENGTHY report has been issued by Committee No. 2 of the Municipal Corporation, relative to the supply of water to the city, and the proposed works in connection therewith. This document shall form a subject for very special comment in the next No. of the "DUBLIN BUILDER," and for the present, therefore, we content ourselves by a simple abstract of particulars.

Suggestions from competent gentlemen were sought for by public advertisement, and the following gentlemen entered the lists as competitors, to untie this Gordian knot; and various were the systems advocated, as briefly set forth hereinunder.

Mr. Mulvany,	supply to be derived from	Grand Canal.
Mr. Robert Mallet,	do.	Dodder.
Mr. Samuel M'Clane,	do.	Liffey and Grand Canal.
Mr. John Louch,	do.	Royal Canal.
The Sanitary Association,	do.	Royal and Grand Canal.
Mr. Thomas Brazil,	do.	Liffey, at Poulaphuca.
Mr. Richard Hassard, 1st plan,	do.	Royal and Grand Canals.
Mr. Richard Hassard, 2nd plan,	do.	River Vartrey and Lough Dan.
Mr. Neville,	do.	Royal Canal.
Do.,	do.	River Dodder.
Do.,	do.	Liffey, at Kippure.

On submitting the foregoing plans to Mr. Hawkesley, an eminent engineer, the Committee, on the recommendation of the latter gentleman, came to the resolution of recommending that

A supply of 6,000,000 gallons per day from the Grand Canal Company, for £1,500 a-year, to be taken at the eleventh lock of the canal.

A supply of 4,000,000 gallons per day from the Royal Canal Company, for £1,000 a-year, to be taken at the twelfth lock of the canal.

Differences, however, arising as to the terms on which this latter could be effected with the Royal Canal Company, it was proposed to take portion of the supply from the Dodder and portion from the Grand Canal, on which project Mr. Hawkesley thus reports:—

"I am satisfied that a quantity of water equal to from eleven to twelve million gallons may be depended upon from these two sources, and that with moderately judicious management this quantity will be found to be sufficient to afford an ample and constant supply at high pressure, even to a possible future population of 400,000 persons.

"The water of the river Dodder is unquestionably of very superior quality in all respects, except its liability to be occasionally coloured at its mountain source by peat and other vegetable matters. This water, after admixture with the limestone water of the Grand Canal, in the large reservoir proposed by Mr. Neville, in which it would become exposed to the decolourizing influence of light and air, and after undergoing a subsequent slow filtration through a stratum of sand in the proposed filter beds, would cease to be in any degree objectionable on account of its occasional brown tint.

The Committee subsequently came to the following resolutions:—

"That this Committee are of opinion that it is necessary and expedient that the Corporation should take measures to procure for the citizens of Dublin an ample supply of water, of a better quality and description than at present supplied to them, and that it should be delivered at high pressure and on constant service, in the manner now being universally adopted in the cities and large towns in England and Scotland.

"That, in the opinion of this Committee, the plan for obtaining the improved supply of water for the use of the city from the River Dodder, in conjunction with an auxiliary supply from the Grand Canal (as fully described in the City Engineer's Report of the 3rd December, 1858, and in the Report of your Consulting Engineer, of the 30th December, 1858), is the best plan to adopt, and they base their opinion on the facts, that this plan will require but one reservoir and system of works for filtration, &c., to be constructed. That the site selected for these works is situated at but a short distance from the city, in a district thinly inhabited, where land can be procured at a moderate price. That the localities of those works would be most favourable to enable the Corporation (if hereafter called on so to do) to supply the township of Rathmines, and the districts of Baggotrath, Irishtown, Sandymount, &c., with water. That the water of the Dodder and Canal when mixed in the proposed reservoir will be a softer water than taken solely from the canals, and experience proves that the mixed waters do not encrust the interior of the water mains with calcareous deposit to anything like the extent the canal water alone does. That should it hereafter be found necessary, large increased supplies of water can, at a moderate expense, be derived from the Dodder by constructing storage reservoirs on the higher portions of the river, and that your Committee believe the ultimate cost of those works, including the purchase of the mill power on the water courses, will not exceed the cost of taking the supply from the two canals, after adding ten per cent. to Mr. Hawkesley's estimate for contingencies, while the rent demanded by the Royal Canal, £1,200 per annum, will be altogether saved.

"That this Committee recommend that the amount estimated by Mr. Hawkesley, £150,000, as requisite for carrying out this plan to completion, be borrowed from Government at the rate of four per cent.

"That this Committee recommend that the Corporation shall solicit from Parliament, next year, an amendment to their Water Works Bill, and that all necessary steps be taken by your engineer, under the advice of your consulting engineer, for preparing the surveys, sections, plans, and estimates, during the ensuing summer, in order that they may be ready to be lodged in the private bill office next November, pursuant to the standing orders of Parliament; and the Committee consider, that as the lease with the Grand Canal Company, under which the present supply from this canal is taken, will expire in 1865, there is now no time to be lost in obtaining the proposed bill.

"That the Committee recommend that permissive powers be taken in the Bill, for purchasing the rights of the mill-owners on the Dodder, above the City Weir, and below the Weir on the City Water Course, and the Earl of Meath's Water Course, as also for supplying with water the Earl of Meath's Liberty.

"That powers be taken to contract with the Grand Canal Company for water from the Grand Canal, or the Midland Great Western Railway Company for water from the Royal Canal, as may be found necessary.

"That powers be taken to alter the present system of rating for Pipe Water Rents, so that after the passing of the proposed Bill, the Water Rate shall be levied from the owners of houses opposite which Water Mains are laid as a Poundage Rate on the Poor Law Valuation; and that for all holdings under the value of £8 per annum, the landlords shall be liable for the water rate, as they are for the improvement rate. That all charges for water-closets, private baths, and stables be abolished, and that the water to be supplied to large consumers and manufacturers shall be charged for by the quantity supplied—to be ascertained by meter or otherwise, as may be fixed on.

"That power be taken by the Corporation to assess, levy, and collect a water rate not to exceed 7½d. in the pound, on the Poor Law Valuation; this rate to be applied for pipe-water purposes only.

"That power be taken to enable the Corporation to afford a supply of water to, and to lay mains for that purpose, within the Township of Rathmines, and the parishes and townlands adjoining the city boundary, such as Baggotrath, Ringsend, Sandymount, Irishtown, Rathgar, and Clontarf, upon being called upon so to do by a requisition from the ratepayers, in which case the Corporation shall have the power to levy a water rate on such places, not to exceed sixpence in the pound on the Poor Law Valuation; this rate to be only levied on houses fronting to or immediately situated on the line of street through which the mains are laid, as in the city; and that the Corporation shall have power to make special agreements for the supply of water within such districts, by meter or otherwise, for any purpose other than household purposes."

TRINITY CHURCH, KILLINEY.

THIS church was opened for service on Sunday, the 15th ult. From the resort of inhabitants to this pleasing locality it was felt that increase in church accommodation was required, and Mr. Warren, the proprietor of the soil, having presented a site and liberal subscription, also contributed largely towards the fund now collecting to defray the expenses, the foundation stone with its usual archives and coins of the realm was deposited 16th March, 1858.

The building is in the early English style, picturesquely situated on the north side of Killiney Obelisk Hill commanding extensive view of the suburbs and Bay of Dublin, and having enclosing wall and gate in appropriate character. It affords accommodation for 250 persons, has a tower on its south-west angle forming a porch surmounted by a bell turret and spire, of light proportions. There is also a gallery and robing room, the latter forming an attached building, and serving with the projecting chancel to make variety in the outline of the design. The roof is of open timber-work, and with the pewing stained and varnished, giving, on the whole, a pleasing effect, and with the stove and general arrangements every comfort desirable. The walls are of the mountain granite, quarried, for most part, from the site, and the slating is worked out in trellis pattern of different coloured material. A mural tablet has already been erected to one of our Crimean heroes, who in youthful days, resided in a neighbouring mansion. The endowment was effected by the Rev. John Gregg, Archdeacon of Kildare, from money entrusted to him for church purposes by the late Thomas Vance, Esq., of Dublin. The design is that of Mr. S. Symes, architect, and the work has been ably executed by Mr. W. Moyers. The total cost, complete for service, being £1,500.

THE ROYAL HIBERNIAN ACADEMY EXHIBITION— A PEEP INTERNALLY.

Previous to particularising a few of the many beautiful works of Art which adorn the walls of the Academy's *salons* this year, we take occasion to offer a few introductory remarks respecting the past history of this Institution, in which all admirers of the Fine Arts must feel a greater or lesser interest.

Happily those differences that did exist amongst its members have become mere matters of *the past*, and therefore it would be bad taste for us to comment upon them; but we must in common offer our congratulations to the Academy that, far from evil results arising therefrom, they seem rather to have stimulated to increased exertion, and contributed to raise the Institution from the level to which it had sunk, to that standard its mission and its resources eminently entitle it to attain.

We are permitted to mention, that, in the course of the current month, important changes will take place in the constitution of the Academy; and, we need scarcely add, it will afford us much additional pleasure to chronicle advancing steps. On the 5th of August, 1823, this Institution was incorporated, and since that date has continued to receive a grant of £300 per annum from Government, which, however—devoid of other support—is quite inadequate to secure even a bare existence. We have reason to hope that the late investigation into the state of affairs will result in an increased annual grant, and that the popular saying, "out of evil cometh good," may he substantially and speedily fulfilled. Such benefactors of artistic tendency as the founder of this Institution, the late Francis Johnston, architect, unfortunately present themselves in this country but once in an age; therefore exists the double necessity for self-reliance and the energetic application of the lever of exertion to elevate the fabric. Much has been done by the Academy even under untoward circumstances towards the cultivation of an artistic taste in Ireland; but with returning prosperity we trust that the members will become sensible of the fact that much more palpably remains yet to do. An important impetus has been given to Art by the annual artistic displays of the Academy, by our great national collection of 1853, and the consequent establishment of the National Gallery, as also by the introduction of Art Unions based on sound principles, whose silent workings will gradually find their way into the humble cabin of the peasant as well as into the stately halls of the nobleman, and this is a fitting opportunity to embrace an advantage and push on in the path of progress with redoubled ardour. The pecuniary encouragement to exhibitors is at present comparatively trifling, though we believe that this year there has been a slight reaction, mainly owing to the rights of selection by prize-holders in the Art Union of Ireland, and to the voluntary aid contributed by the Lord Lieutenant, who purchased largely. We would suggest a "prize fund" to be established either by subscription or otherwise, as an additional inducement both in a meritorious and a pecuniary point of view, and doubt not that the influx of pictures would be important, possibly the Academy may say "alarming!" However, the trial would appear to be desirable, and is not altogether without precedent.

Though the collection of pictures in this the *thirty-first* annual exhibition, may not, numerically speaking, be as important as some previous displays in our recollection, it is quite equal in merit to any that have hitherto taken place under similar circumstances. The portraits are not quite so numerous this year as usual; but those exhibited, with one or two exceptions, fairly stand the test of criticism—the contributions by Catterson Smith, Martin Cregan, G. F. Mulvany, Charles Grey, and the series on marble by B. Mulrenin, being especially noteworthy. In this department the most conspicuous are, the colossal portrait of Alderman Atkinson in his late mayoralty robes, by Mr. Cregan; and of the present Countess of Eglinton, by Mr. Catterson Smith—wherein the tone and style of drapery is to our mind somewhat ineffective, and questionable as to consistency. The paramount feature of interest to which all steps are instinctively bent is the picture in the Antique-room by P. Van Schendel, illustrating the Nativity, and entitled "*La nuit de Nöel, ou la naissance du Christ.*" We are told in the descriptive note attached to the registry of this picture in the Catalogue, and printed in very questionable French, that—

"Two different opinions, equally probable, exist on the subject of the birth of Christ. Certain authors pretending that the Saviour of mankind was born in a grotto; others, in a ruinous stable; it is under this last point of view that the artist has desired to reproduce the history. The character of his architecture is borrowed from the Ruins of Palmyra and Baalbec. Foremost in the tableau is seen a woman clothed with a white and scarlet robe, the artist being convinced of the existence of this tissue amongst the Hebrews, having had in his possession a piece of that material found on an Egyptian mummy, has considered himself at liberty to adopt this costume."

The effect of torchlight upon the newly-born Redeemer—a chubby infant—as he lies in a manger, and on the other figures and objects in the picture, is marvellously truthful. We must allow the artist his licence as regards the architecture of the stable, though we experience difficulty in reconciling its consistency.

Turning from this beautiful picture we find at either side a collection presumed to represent the Architectural Department. Gladly, however, should we—if enabled truthfully—award a meed of approbation to the display here likewise, but we are precluded from that pleasure, and for the credit of the profession sincerely wish it had been omitted altogether. Ireland has produced and still possesses some of the first draughtsmen and colorists; and there can be no excuse therefore, for architects sending half-finished dauby drawings to a public exhibition, or on the other hand for being so very sparing of their contributions. We apprehend that the Academy and the profession cannot mutually appreciate each other, and that possibly the desirability of exhibiting good drawings and liberally is not sufficiently impressed on the latter.

Mr. W. J. Barre (Bappe in the catalogue) of Newry, a rising young architect, exhibits a good perspective of his design for the proposed Molyneux Church, and which, although not adopted, justly attracted much of the committee's attention and favour. Mr. M'Carthy, a newly-elected A.R.H.A., contributes two perspectives, and fairly executed, of Holy Cross Church, Tramore, now being erected from his designs, as also of the recently built Foreign Missionary College of All-Hallows, near Drumcondra. Two views of a church—not named in the catalogue, but presumed to be submitted in the recent competition for the Molyneux Church—are exhibited by Mr. M'Curdy, and display some praiseworthy points. The others are by Messrs. Gribbon, Geoghegan, and Henry J. Byrne respectively. The former gentleman contributes six drawings, comprising collegiate, ecclesiastical and commercial buildings executed from his designs. We should have wished No. 351 had been consigned to oblivion, for the veriest novitiate might be ashamed of it, both as to design and execution. Our space reminds us that we must postpone further notice until our next number, when the subject shall be reverted to.

SANITARY CONDITION OF BELFAST.

We are told "that the sanitary state of this town is most satisfactory; that the inspector, Mr. Lavery, is making every exertion to promote health and general cleanliness; that in districts hitherto notorious for dirt and epidemic there is a marked improvement; that houses are being whitewashed, cesspools removed, privies built; overcrowding in small lodgings houses stopped, and ventilation extended and promoted as far as possible." For ourselves we must admit that on the occasion of a very recent visit we noticed much room for improvement. The principal thoroughfares, where obstacles to health would be palpable, seem right enough, but in immediate proximity in narrow lanes and courts, where one might shake hands from opposite sides, filth is predominant, noxious odours are sent forth to be breathed by the habitual frequenters of Castle-place, High-street, &c., &c., and while such passages as those from Rosemary-street to High-street exist, the lauded sanitary state of Belfast is imaginary and delusive.

It will be seen by our advertising columns that the respected firm of Messrs. Sheils and Scott, for upwards of thirty-five years known in Dublin as the most extensive manufacturers of ladies' and children's boots and shoes in this country, with a view of meeting their increasing trade, are removing to a more extensive concern in the centre of the metropolis, and from the last number of "The Dublin Builder" it appears their establishment in Westmorland-street is being attractively fitted up from designs and plans by J. J. Lyons, Esq., architect.—*Belfast Daily Mercury.*

METROPOLITAN COMMERCIAL ARCHITECTURE.

That *old* Dublin, yielding to the innovations of modern times, is gradually consigning to oblivion her quaintness, her peculiarities, and, we may add, her deformities, is, at least as regards commercial architecture, a notable fact, and a subject for congratulation. Ill-fashioned shop-fronts with squat story-posts, many-squared sashes, entablatures mean or tawdrily decorated, pigeon-hole windows above, and dangerous gratings—receptacles for dust, &c.—below, are being replaced by lofty plate-glass, consoled and richly-entablatured elevations transmitting light to basement through handsome cast-iron work in the pedestals, and suitably decorated in all their parts. It becomes our peculiar pleasure this month to chronicle some progressive steps which cannot fail to add to the architectural embellishments of our city; and amongst them we may particularise the following:— Mr. Scriber is about erecting in D'Olier-street a repetition of his present handsome front in Westmoreland-street; Mr. Caldbeck, architect. In the same street, Messrs. Sheils and Scott's new warehouse, already described, is completed; Mr. J. J. Lyons, architect, Mr. W. Hughes, builder. Close by, Messrs. Fry and Co. have taken two houses in Fleet-street, and are enlarging; Mr. M'Curdy is the architect. Mr. Gatchell, late of Pill-lane—and removing therefrom, owing to the commencement of a new street from Four Courts to Church-street—has taken premises and contracted for a new warehouse in Dawson-street, at an expenditure exceeding £2,000; Mr. Gribbon, architect. In Henry-street, that monster of monster-houses, Cannock, White, and Co., is *still* extending; three different builders being under contract at present for its enlargement, by directions of Mr. Anthony, architect; and immediately opposite its gigantic front has recently been opened a new establishment, of less magnitude no doubt, but possibly having proportionate claim on public favour; we allude to that of Mr. Telford, and fancifully designated "The Crystal Palace." The appellation may possibly be suitable as regards the interior, which is plentifully stocked with a choice collection of all that is beautiful in glass manufacture; but our uninitiated friends must not be misled as to its architectural resemblance to the great prototype of 1851. The front is cemented from cornice of showboard to parapet, and the showboard—surmounting large square sashes filled with plate-glass, and a central recessed porch with mahogany swinging doors—has a frieze with continuous glass panel and illuminated lettering, and a scroll-carved ornament on cornice. We presume the architect, Mr. Gribbon, made the most of the means at his disposal, though there was an opening here for a little more architectural display. Several matters of importance are in embryo, of which it would be premature to speak just now.

MOUNT ARGOS NEW BUILDINGS—RATHFARNHAM.

In a recent number of "The Dublin Builder," we gave a few descriptive particulars of a large structure about to be erected for the society of Blessed Paul, in the neighbourhood of Rathfarnham, announcing at the time the name of the superintending architect, and the then declared contractor, Mr. Hugh Kelly.

Subsequently, however, changes took place both as to the designs to be executed and the parties concerned in carrying them out; and we are now enabled to lay before our readers an exact description of the work as it is to be, unless some further changes—of which we are not aware—be deemed desirable. The building as contracted for will form two sides of a quadrangle, viz., the south and west; the former presenting a principal front extending 200 feet, and the latter a flank of about 218 feet in depth—all three storeys high, and terminating by a projecting corbelled roof of high pitch. Externally, the style of architecture is very plain, perhaps slightly savouring of Byzantine; the windows lighting apartments, on ground-floor being semicircular-headed—double lights introduced in wing—and those of the upper, square, with semicircular relieving arches over them. With the exception of one projecting wing at junction of the south and west elevation, the fronts are unbroken in outline, and will be constructed of rough-punched mountain granite and Ballyknockin stone-dressings, plinths, &c.

Internally, the principal storey comprises, in the southern building, a central entrance-hall 29 feet wide, approched by an open porch pedimented, and communicating with a corridor 9 feet in width which runs thorough. At either side of hall are apartments for reception-rooms (two in number), parlour, wardrobe, almonry, and four confessionals; and in the western flank is a large refectory 76 feet 10 inches by 32 feet, with six polished lime-stone columns supporting groined-arching, and in the locality of same, and at either side, are the culinary offices, lavatories, pantries, closets, &c. The second and third floors respectively contain library and oratory, each 49 by 24 feet; infirmaries, bath-rooms, closets, novitiates and community rooms, &c., and about seventy cells approached by continuous corridors same as below. The new plans for this building have been furnished by Mr. J. J. M'Carthy, A.R.H.A., architect, and will be carried out under his superintendence by Mr. Meade, the contractor, at £13,200.

ST. DOULOUGH'S CHURCH, COUNTY DUBLIN.

Attention having been recently called to the dilapidated condition into which this time-honoured structure is gradually falling, we subjoin a short sketch of its history, and sincerely trust that a desire to preserve our national antiquities is sufficiently present to ensure this—perhaps the most interesting and perfect remnant of Ecclesiastical architecture in the neighbourhood of Dublin—from the speedy ruin which is said to threaten it:—

This church was originally, as indeed it still continues to be, a cruciform structure, but the original nave has long since given place to a small modern church. At the time of its foundation, however, this form appears not fully developed, for the transepts are remarkably small, as also is the eastern portion, or original chancel. Though it possesses the stone roof in common with the Saxon churches, all its windows and arched loop-holes approximate to the pointed form; a circumstance that may be taken, either as a proof of the extreme antiquity of the use of the pointed arch—admitting this to be one of the early Saxon churches—or used as an argument for its Danish origin, if it had not been built until the termination of the tenth century. This is one of the churches which, according to Mr. Beaufort and other writers who have followed his authority, "different in its style of architecture from any in Britain, has been built in imitation of the original Christian churches in the southern countries." For our own part, in this particular specimen we can discover very little even of the rudest similitude to the "columns and pilasters of the Corinthian or Doric orders," of which those gentlemen speak; nor are these churches, in our opinion, anything superior to the Gothic or Pointed architecture afterwards introduced, as they very confidently assert. Dr. Ledwich contends, on the contrary, that a chapel in the ancient church of Rippon, in Yorkshire, founded A.D. 660, and the cryptical sepulchres and oratories, mentioned by Gregory of Tours, and Bede, are the exact archetypes of ours. He also gives credit of their erection to the Danes, though his proofs are rather problematic. "St. Tulloch," says he, "is a corruption of St. Doulough, and both are a corruption of St. Olive." This latter Saint was not born, it is said, till the year 993, and dying in the year 1028, he could not reasonably be canonized, and have this church erected to him sooner than a century after. Indeed, considering how cavalierly he treats poor St. Patrick, by denying him the honour of having ever had any existence, one is apt to wonder at his overstrained complaisance to the Danish saint, whom he ranks as a downright modern, about whose existence, or saintship, he could entertain no doubt at all. But the object of Dr. Ledwich, in the latter case was to prove that the cryptical and stone-roofed churches (with the exception of the round towers, confessedly the most ancient specimens of stone buildings in Ireland), were the work of the Danish invaders; in which, if he succeeded, it would follow, of course, that the Irish themselves had not before that period any edifice of stone, either for religious purposes, or any other; that to these northern invaders the original inhabitants of Ireland were indebted for whatever portion of the arts or of civilization which the country could boast; and, in a word, that all the stories which Irish historians have so repeatedly asserted to the contrary, were no better than the inventions, or, as he learnedly terms them, "the figments" of modern times. That the church of St. Doulough, let the saint be what countryman he may, and the other stone-roofed edifices of Ireland present an order of architecture something singular in its construction, and differing in many particulars from the pointed Gothic style, there can exist no doubt. In a former section we have shewn how closely they assimilate with our round towers. They are both stone-roofed edifices, and the only difference is, that the one, from its circular form, where perfect, produces a cone; the other, with its lofty gables, forms a very acute angle, in the shape of a wedge. The octagonal well which adjoins the church, affords another specimen of this mode of roofing, forming a cone with eight sides. But the grandest example of this Saxon style in Ireland, both for magnitude and beauty of architecture, Dr. Ledwich admits, is St. Cormac's Chapel, at Cashel. He is also inclined to think that this Cormac was slain in battle by the Danes, and he forms this opinion on the testimony of Caradoc, a Welch historian, on whom he relies more as to this royal saint's existence, than on the plausible fictions of national writers. Taking, therefore, this admission of the Doctor against his own hypothesis, it is pretty clear that the Danes would not erect this chapel in memory of a saint, who had thus fallen a martyr in defence of his religion and his country, against pagan invaders; and who in fact had been slain by themselves. If this argument be conclusive, the Danes did not build that chapel to the memory of St. Cormac. But we have another reason against the supposition still stronger; for the Doctor himself proves, not only that it assimilates with the best and oldest specimens of Saxon architecture in England, but that "it is infinitely more curious, and in every respect purely Saxon." Neither is it probable that they built this church of St. Doulough as a shrine for St. Olave, who was not born till the year 993. The building is apparently of a much older date, and appears to be one of the earlier and more imperfect attempts of the native architects or masons at this style of Saxon architecture, of which St. Cormac's chapel was (in Ireland) the *chef d'œuvre*, and most probably had been erected at least a century later than that of St. Doulough. Indeed it is not likely that a roving barbarous people, like the Norwegians or Danes, whose sole object was invasion and plunder, would much trouble themselves about building churches at all, especially in the earlier period of their irruption. If afterwards, when they had completed their conquest, and acquired a permanent settlement, they resorted to the practice upon their conversion to Christianity—and that we can suppose the church of St. Doulough to be really their work; or if it was built as a shrine for St. Olave, subsequent to the year 993, as Dr. Ledwich suggests—it would in that case be pretty clear that so far from being the original introducers of building with stone and mortar into Ireland, they only adopted and conformed to the fashion of the religious buildings long in use in this country. The conclusion we arrive at by this train of reasoning is, therefore, simply this: that if the Danes built this church, it was but a clumsy imitation of the superior style in use before their arrival; and if they did not build it—which I think is the more probable supposition—they only acted like most other successful invaders, by seizing the churches of the people they had conquered, re-consecrating them in honour of their favourite saints, and appropriating them to their own use. In this part of the inquiry, however, we are no farther interested than as it enables us to ascertain thereby the period of their foundation. If that object be in any degree accomplished, the discussion has not been altogether useless. We may presume, therefore, that if the stone-roofed churches at Glendalough were founded by St. Kevin, and probably built under his immediate inspection, their origin must have been in the sixth century, for that saint died in the year 618. St. Doulough's church would deem the work of perhaps a century or two later; for the round tower steeple seems to have been discarded at the period when that church was built, and the Campanile or square tower substituted in its place. Perhaps the latter might have been a subsequent addition. Cormac's chapel, if founded by that monarch, must have been built in the latter part of the ninth century.

AN ANCIENT SCULPTURED PILLAR STONE.

ACCORDING to tradition, an interesting relic of remote antiquity—of which the accompanying particulars convey an idea—marked the grave of an early Irish saint. It is of hard granite, in length three feet five inches, in breadth one foot ten, and in thickness five inches. The stone bears two sculptured crosses, symbolical of the Christian faith, one on the front and the other on the back; each cross is enclosed within a circle, the emblem of eternity. The crosses and circles are greatly worn by the action of the elements during more than twelve centuries. It stood in "Owen's-lane" (which leads from Corn Market, through St. Audoen's arch, to Cook-street), near the door of entrance to the ancient church of St. Audoen, or Owen. From time immemorial it was called the "Blessed Stone," and was held in very great respect and veneration by the Catholics of Dublin. In the year 1826, when the church near which it stood was undergoing repair, this ancient monument was taken up, carefully removed, and buried in a yard in Cook-street, where it remained for some years. It is now in the possession of the Very Rev. Dr. Spratt, of Aungier-street, who looks on it as an object worthy of respect for its very great antiquity.

The following is from the celebrated antiquarian, Dr. Petrie, M.R.I.A., author of the "Round Towers of Ireland," &c.:—

67, Rathmines Road, 21st Oct., 1853.

MY DEAR DR. SPRATT—In obedience to your request that I should give you my opinion respecting the probable antiquity of the interesting ancient stone on which a cross within a circle is sculptured, and which, till it came into your conservating custody, was to be seen near the ancient Parish Church of St. Audoen, I have no hesitation in expressing my opinion that it belongs to a class of monuments—most probably sepulchral—which are now rarely to be met with in Ireland, and which appears to me to be of a very early Christian age; and I have no doubt that this stone is much more ancient than any portion of the very old church now remaining, with which it was formerly connected.—Believe me, my dear sir, most faithfully yours, GEORGE PETRIE.

Biographical Sketches.

THE LATE WILLIAM VITRUVIUS MORRISON, ARCHITECT.

WILLIAM VITRUVIUS MORRISON was descended from a race of architects: his father, grandfather, and great grandfather having successively exercised and illustrated that profession by their works. The family had resided for several generations at Middleton, in the county of Cork.

Numerous specimens of the taste and professional ability of the late John Morrison still exist in that part of Ireland. He was as celebrated for his mathematical and scientific as for his architectural abilities; and he realized a handsome fortune by the exercise of his profession.

The father of W. V. Morrison (the late Sir Richard Morrison) left his native province early in life. His original destination had been the church.

The state of the father's affairs changed the original destination of his son, whose tastes, moreover, leant strongly to the family profession, although discouraged by his father, who seems to have been strongly tinctured with that professional jealousy, which seems to characterise that profession, and which will not admit an emulator even in a son.

Richard Morrison arrived in Dublin at an early period of life, where he pursued with avidity the tastes which led him to the profession he had chosen, under the most eminent professor of that art. The name of his master, Gandon, will live as long as taste shall endure. The Custom-house, the Courts of Law, the east Façade of the Bank of Ireland (then the Houses of Parliament), the King's Inns, in our city, will hand down his fame and abilities to posterity. Richard Morrison was enabled to pursue his studies with advantage from the emoluments of a government appointment in the Ordnance Department, procured for him through the influence of his godfather, the Earl of Shannon. He soon developed considerable talent in the profession he had selected, and having lost, by reductions, the place he held, he was shortly afterwards selected from the superiority of the designs which he had furnished to carry into effect some considerable alterations in the Cathedral of Cashel, in the county of Tipperary. He had shortly before this been united in marriage to Miss Eliza Oulde, the daughter of the Rev. William Oulde, LL.D., Rector of Philipstown, in the King's County, and Chaplain of the Lying-in-Hospital, Dublin, and granddaughter of Sir Fielding Oulde, who held during a long period the highest rank amongst the physicians of Dublin. Richard Morrison continued to exercise his profession in the south of Ireland for some years. He resided for some time at Clonmel, where he planned and erected the County Court-house of Tipperary, and there William Vitruvius Morrison was born on the 22d April, 1794. He was named Vitruvius by his father, in anticipation of his future pursuit. His constitution was very delicate from his birth, and with this delicacy of fibre, as he advanced in life, was developed the highest sensibility of character and feeling. These traits were the leading features of his nature, and ended only with his existence. His strong attachment to his relatives, his disinterestedness, his kindness of heart, his high sense of honour, were born with him and accompanied him through life. His delicacy of temperament prevented his being educated at school, and it precluded him, likewise, during the age when study is pursued with the greatest advantage, from that degree of application which combined with his high natural talents, would have gifted him with all that science can add to genius. His education was entirely domestic; he applied himself with avidity from an early period to the pencil, and became, perhaps, the first architectural draughtsman of his age. This is, indeed, the first and greatest artificial requisite for the architect, and in this William V. Morrison was perfect. His talent for design developed itself at a very early period of his life. His father, Richard Morrison, had removed to Dublin about the year 1800, and was applied to about 1809, by Colonel James Crosbie, late M.P. for the county of Kerry, to furnish a design for a new mansion in the castle style for his seat at Ballyheige in that county. The site of the mansion was a cliff overhanging the great Atlantic ocean. More as an experiment to try the extent of his son's powers, than with any idea that he was capable of such a production, he suggested to William Vitruvius to make an essay at the design for the contemplated castle. (The boy was at this period scarcely fifteen years of age.) To the astonishment of his father he, in the course of a few days, produced the noble design subsequently erected which displayed an accuracy of knowledge of the details and proprieties of this species of architecture, which, in an artist of his years, ranked him at once amongst the few rare examples of early genius, which illustrate the history of the human mind.

The studies, however, of this boy had, from the earliest dawn of reason, been directed, by the natural bias of his taste, with avidity, to the subject of architectural composition; he had examined with an intuitive glance, the history and progress of every species of style and composition; he had marked the beauties, the proprieties, and the defects of each, and he had, at a period when the reasoning faculties are scarcely developed in others, already become an architect.

Richard Morrison from this period found in his son a valuable assistant, indeed, in his professional pursuits; he found in him an exhaustless mine of taste in design and composition. Shelton Abbey, the seat of the Earl of Wicklow; Kilruddery Hall, in that county, the seat of the Earl of Meath—the latter a noble and correct example of the Tudor or Elizabethan style; and Ballyfin, in the Queen's County, the seat of Sir Charles Coote, bart.—an edifice in the Grecian style, attested the rising of the bright star which was soon to illuminate the hitherto dark hemisphere of Irish architecture.

William V. Morrison visited the Continent in 1821; he resided for some months in Rome, and, bringing as he did, so gifted a mind to that classic abode of ancient art, he could not tread her soil and contemplate her majestic ruins without adding to the stores of taste and knowledge in which he was already so rich. At this period of his life and studies, he laboured under extreme ill health, the result, in a great degree, of his assiduous application to his professional pursuits. This prevented him from deriving as extensive advantage from his travels as otherwise might have resulted; it prevented also his visiting Greece, which he had proposed to do. He extended his journeys, however, to the south of Italy, visited the ruins of Pæstum, remained for some time at Paris, and visited on his return all the most remarkable edifices of England. There he improved his knowledge of that style which he ever preferred, and which he indeed introduced into his native island—"the Tudor," for we believe there exists no example of an edifice of this style in Ireland before its introduction in his works.

William Vitruvius for a short time after his return to Ireland, carried on his professional pursuits in connexion with his father, but he soon found that the numerous applications to him individually rendered it desirable that he should pursue his career independently. He was speedily indeed overwhelmed with business, which with the aid of several assistants he could scarcely accomplish.

We have remarked, as the great and striking peculiarity in the works of this eminent man, on the propriety which characterized his designs. This extended to every department of his edifices; his interiors, his ceilings, his stair-cases, chimney or mantle-pieces, all harmonize so beautifully with the principles of his design, that we feel ourselves transported into the times which the work characterizes. His sedulous care in thus guarding and exhibiting the propriety of design, extended to the laying out of the grounds and gardens of the mansions—a care which he ever took upon himself, and in which his nice judgment and intimate knowledge of his subject were equally displayed. The furniture of his Tudor buildings was likewise generally designed by himself, and his taste is exemplified in those minor details in all those edifices.

Whilst thus illustrating his noble art in his native country, and leaving monuments which should for ever establish his fame and his talents, he laboured under almost continued ill health, which seemed to have its seat chiefly in the nervous system. His malady produced the most extreme debility and dejection of spirits, which increased as he advanced in life, until at length every source of joy and pleasurable sensation seemed (as he often stated to the writer of this feeble tribute to his memory) "shut out for ever," and life for him seemed a "dreary waste." This melancholy state of health seems to have been connected with original delicacy of fibre and sensibility of temperament; and the severe attacks of malady to which his latter years were subjected, caused long and serious interruptions to his professional pursuits, as he was induced, with the hope of benefit to his shattered frame, to visit the continent. He resided during one winter at Nismes, in Languedoc, and visited the mineral springs of the Pyrenees; but in the summer of 1837, he was attacked at Bourdeaux with an accession of malady which brought on phrenzy; and after a subsequent paralytic stroke and protracted scene of suffering of nearly four months, he expired at his father's residence, Vaucluse, near Bray, on the 16th October, 1838.

During the long absence occasioned by his malady, the works were superintended by his father, a gentleman who had the good fortune to carry the health, strength, and energy of youth into an advanced stage of life.

Owing to this circumstance, it has occurred that the authorship of many of the designs of William Vitruvius has been attributed to Sir Richard Morrison—a mistake the more to be regretted as the latter very eminent architect has no need of adventitious laurels, having by a long series of admired works fully established his own professional fame and character.

The remains of William Vitruvius repose in the cemetery of Mount Jerome, village of Harold's-cross, near Dublin (as previously noticed in "THE DUBLIN BUILDER," in "A Ramble through our Cemeteries") where the piety of his friends has inscribed an epitaph to his memory.

The following are the most remarkable buildings designed and executed by William Vitruvius Morrison, M.R.I.A.:—

Ballyheige Castle, County Kerry, the seat of the late James Crosbie, Esq., M.P. (*vide* "Neal's Views of Seats," vol. 6, 8vo edition); Borris House, County Carlow, the seat of the late Walter Kavenagh, Esq., M P., a Tudor building (*vide* "Neal's Seats," vol. 6); Oak Park, County Carlow, the seat of Colonel Bruen, M.P.; Glenarm Castle, County Antrim, the seat of the late Countess of Antrim, a Tudor building, situate in a most lovely spot on the sea-shore of Antrim, surrounded by a noble park, and in full view of the highlands of Argyleshire, Scotland, distant not more than fifteen miles; Hollybrooke, County Wicklow, the seat of Sir George Hodson, Bart.—a building in the florid Tudor style. It is situated in a most romantic position, under the Sugar-loaf mountain, on a wooded bank, overhanging a mountain lake, and surrounded by bold and varied mountain scenery, twelve miles south of Dublin; Baron's Court, County Tyrone, the seat of the Marquess of Abercorn—a splendid edifice in the Grecian style; Clontarf Castle, County Dublin, the seat of John E. V. Vernon, Esq.—an union of the Tudor and castle styles of architecture. The castle and the ancient village of Clontarf (the site of the celebrated battle fought under King Brian Boroime against the Danes in the eleventh century) forms one of the most picturesque spots in the Bay of Dublin, distant scarcely two miles from that city; Oxmean, near Belfast, the seat of the Marquess of Donegal—a building in the Tudor style, on the shores of the river Lagan; Ballygiblin, near Mallow, County Cork, the the seat of Sir W. W. Beecher, Bart.; Mount Stewart, Newtown Ards, County Down, the seat of the Marquess of Londonderry; Brittas Castle, Co. Tipperary, the seat of Captain Langley. The design of this edifice was, by the desire of the proprietor, both in form and proportions, that of the ancient English baronial castle of the earlier period; the building, owing to the sudden death of Captain Langley, was never completed. The Priory, County Tipperary, the seat of Sir Henry Carden, Bart.—a building exemplifying the union of the abbey with the Tudor style of architecture, as seen in many edifices of the reigns of Henry VIII., Edward VI., Mary, and Elizabeth, when the confiscated abbeys were converted into dwelling-houses by those to whom they had been granted on their dissolution. Cottage at Lough Bray, County Wicklow, the seat of the late Sir Philip Crampton, Bart.—an example of the Swiss cottage style with the old English cottage (this building was erected at the expense of the Duke of Northumberland, when lord lieutenant of Ireland, as a complimentary offering to Sir Philip Crampton, for his professional services); monument to the memory of the late General Ross, at Ross-Trevor, County Down, erected by his widow; monument to the late Captain Skinner, at Holyhead, erected by subscription; Court-house at Carlow—a superb example of the Grecian style of architecture; Court-house at Tralee, County Kerry; Fassero, near Bray, County Wicklow, the seat of the late Judge Crampton; cottage at Ross-Trevor, County Down, the seat of S. Hamilton, Esq.; design for tower and alterations proposed at Trinity College, Dublin; Miltown, County Kerry, the seat of Sir John Godfrey, Bart., Tudor style (see "Neal's Seats,") vol. 6.

The following buildings, designed by William V. Morrison, were erected and carried on whilst in partnership with his father, the late Sir Richard Morrison:—

Ballyfin, Queen's County, the seat of Sir Charles Coote, Bart.—a superb edifice in the Grecian style; Kilruddery Hall, County Wicklow, the seat of the Earl of Meath—a noble example of the florid Tudor style. This edifice stands in a most romantic position in the midst of a mountain-park and surrounded by the grandest scenery of the county. The interior decorations correspond with the majestic style of the exterior, and it is a noble example of the taste, talent, and science of William Vitruvius Morrison. Shelton Abbey, County Wicklow, the seat of the Earl of Wicklow—*vide* "Neal's Seats," vol. 6—an union of the abbey with the Tudor style of architecture. A great part of the old fabric having been preserved by desire of the proprietor, and adapted to the modern building, the taste of the architect was much fettered in his design, and the building rendered much less perfect than it otherwise would have been.

HEALTH OF TOWNS.

Seeing that in "The Dublin Builder" considerable interest is being manifested in the sanitary arrangements of our towns, I take the liberty of offering a few observations on this important subject:

I think it may be laid down in a theorem that no individual has a right to do anything prejudicial to the rights of the community at large for his own benefit. In fact this is taken for granted in all sanitary legislation, and on this basis the whole of the coercive clauses of town improvement acts, &c., proceed. Clauses against overcrowding human beings in lodging houses, against erecting dwellings without yards, and others of a like nature, show that our senators are in some degree acquainted with the necessity which exists for such restraints. But I hold that legislation on this head, as in almost all others, is exceedingly defective. In a town improvement act, which applies to one of the largest towns in Ireland, there is a clause requiring each house to be hereafter built to have a yard 10 feet broad, but there is no provision made to prevent any part of this from being built on, and usually the greater part of it is covered with a return, offices, &c.

There may be towns in Great Britain and Ireland which are stationary as to their population, but I am not acquainted with them, and they are, if they exist, exceptions to the general rule, that all thriving towns are rapidly increasing in extent and population, and as a natural consequence many of their streets and thoroughfares are becoming much too confined for the increased number of wayfarers who now frequent them. Land also in many situations, when it was formerly of little value, has greatly increased in price, and as a necessary consequence soon becomes closely covered with dwellings, in order that the maximum amount of rents may be drawn from it—all tending to increase and perpetuate the evil of which I complain—of overcrowding the people. The ancient and laudable custom of forming squares in towns, seems altogether abnegated, and landowners appear willing to adopt only that design which will show the largest rental.

When a speculator has taken a plot of building ground, he puts his affairs into the hands of some percentage paid architect, and their views completely harmonise, for each desires to make the most he can out of the transaction; it is the interest of both to crowd as many houses as possible on the ground, irrespective of all other considerations. Such views, without legal restraint, has led to the building of lanes and courts in our towns, perfectly unfit for the habitation of man, or even the lower animals, and the work is still going on, for as yet there is no law to prevent it. To my mind legislation on the subject would be simple. Each house should occupy a certain number of square feet of ground, a certain portion of which should not be built upon. We have a general Towns' Improvement Act to be adopted, in whole, in part, or not at all, just as the influential classes think proper, and to three or four of the most important towns it does not apply, as they are excepted from its operations. In those towns the lawyers reap a rich harvest from the continual necessity which *they* see to exist for improvement bills. In a northern town of my acquaintance there are at least three governing bodies acting under the authority of Acts of Parliament. The Town Council has become rather notorious for the number of acts it has obtained, and there are besides the Water Commissioners and the Harbour Commissioners, each of whom have spent a considerable sum in the same way. All this convinces me that it is not lack of legislation which is the cause of the evils we complain of remaining unabated, but it has not yet taken the right direction. Surely the time has arrived for giving us laws that we can understand laws, applicable to all. I am of opinion that one general act could be made to apply to all towns, to all harbours, &c., and that there should be no exceptions, and that the time has arrived for applying the same laws to each of the three kingdoms. However, all I wish at present to enforce is, that the law, as it now stands, is entirely inefficacious to prevent or remedy many of the sanitary evils of our towns and villages. That drainage, cleanliness, an abundant supply of water, and the reformation of the dwellings of the poor, in narrow lanes and courts, should be compulsory everywhere, taking care that only a certain number of individuals should be allowed to reside on a certain area. Prisoners confined in our jails are usually allowed one thousand cubic feet of space to live and sleep in, with airy corridors and yards to take exercise in, scientific ventilation, and the enjoyment of many comforts, which are denied to the labouring classes of our towns and villages. The perpetual warfare carried on in Town Councils and the Houses of Parliament between the two great factions of Whig and Tory into which the population is divided, has a great effect in retarding useful reforms, so that with all our advances in the arts of locomotion, transmission of news, and substitution of mechanical for human labour, beyond that of our forefathers, we have in many respects been stationary, if not even retrogressive sanitary evils, and sanitary ignorance still largely prevail. Examine your churches or places for religious worship, and you will find many of them without any appliance for ventilation. Walk abroad and see noxious trades carried on in the very centre of a dense population. Look into some of the courts and alleys, three or four feet wide at most. Enter one of these abodes and count how many human beings reside in every thousand cubic feet of space, &c., &c., and say if there has been sufficient progress made in this direction. This is a subject to which, doubtless, you must recur again and again. M.

THE RENAISSANCE; OR, TUDOR STYLE OF ARCHITECTURE.

The taste displayed by most of our countrymen for works of art, in the erection of their residences, from the villa of the humble artizan to the lordly mansion of the possessor of Erin's broad acres, induces me to lay before your readers some few remarks upon that style now so generally adopted, and which for many centuries has so distinguished the works of English and foreign architects; and as these observations have been culled from the note-books of an honoured relative now no more, I think it but due to his memory to bring before your notice the complimentary remarks made by the compiler of that most interesting work, "Neale's Views of Seats," where, in speaking of "Kilruddery," the seat of the Earl of Meath, in the county of Wicklow, he says—"Much is due to the architect for the good taste of introducing into his native country a style before unknown in it." The note-bock from which I have taken the following, contains many exquisite designs, original as well as copied—they never came before the public; but I think when so manifest a display of refinement in the taste of our rising generation is made, more particularly in the style of which we are speaking, it would be selfish to withhold the information contained in the following:—

After naming the various descriptions of mansions remarked by him in his tour in Italy, France, and England, he mentions more especially "four houses," of which he says there were three sorts, "the kennelled, or embattled mansion, the hall, or unembattled gentleman's house, and tradesmen's habitations. The embattled mansion partook both of the castellated and collegnated forms; like the former, it was crowned with embrasures, and surrounded with a moat to the country, always one and sometimes three towers (though seldom more than one) placed at the front of most strength, which consisted of three or four storeys containing each a floor or room. Like colleges, the unembattled houses were uniformly constructed around a court with a turreted gate-house of entrance, throughout fortified with towers and a portcullis, as were castles; the principal apartments were the hall, the guest-chamber, kitchen, and chapel. The hall was a copy of those colleges which, in their time, were of conventual origin; here the master, with his guests and family, dined every day at a long oak table, elevated two or three steps above the rest on the high dais, whilst the retainers were seated below at right angles with it. The hall was lighted by one or more gothic windows and a long bow-window on the dais forming a recess; it had no fire-place, but was warmed by a thaycer of live coals in the middle, the smoke escaping by the rere dosse from the roof. At the lower end was a screen of latticed-work supporting the minstrels' gallery; under it was a narrow lobby communicating with the shuttery hatch, and beyond this the kitchen and other offices. The guest-chamber opened at the other end, and had a fire-place. The chapel was a small room over the gallery.

To those houses succeeded the embattled mansions of Queen Elizabeth's time; these were of two kinds, the greater and less. One an improvement on the rude quadrangle, the other an expansion of the castellated. One luminous and magnificent, the other compact and lofty. The characteristic accompaniments of those houses were huge arched fire-places in the halls and kitchens, chimney-places to the chambers of state, richly carved and adorned with armorial bearings, mixed with grotesque figures; and to those houses were generally grand long galleries for music and dancing—an apartment never existing in the more ancient mansions.

The embattled gentleman's house partook of these general features, but was smaller; it was in general returned from the street by a court round which opened the apartments, and entered by a gate without a lodge. The most ancient of these houses consisted of a through lobby with a "parler" beyond it on one side, and on the other the kitchen and offices. These were followed, in Elizabeth's time, by mansions having an enclosed park which led to the hall, where in the windows are found remains of painted glass with arms, cyphers, figures of ancient and scripture history. Small round or oval pieces, well drawn but in faint colours, unlike the glowing colours of the foregoing centuries. They appear to be of Flemish manufacture. The tradesman's house was one or two long ranges, terminating by gables in the street. The shop occupied the entire breadth, and was without glass; behind was the kitchen, and beyond a small court around which the warehouses and offices (the pride of the owners) were the signs which denoted their craft by some ancestral device; these either presented face to the street or were stuck on high roles opposite the door.

The foregoing I copy as written, perhaps, not intended for the critic's eye, but I think it best to give the ideas of the author without interference with the composition or diction. E. A. M.

Notes of New Works.

The Bank of Ireland Directors have completed their new office in the town of Roscrea, from the design of their architect, Mr. S. Symes. The building contains the usual requirements of cash-office, private office, and safes, &c., together with accommodation for the agent and sub-agent, and is somewhat in Italian style, having basement, dressings, and cornice of the neighbouring sandstone, with front of Coal Island fire-brick, forming, on the whole, a pleasing contrast. The work was executed by Mr. J. J. Bagnell, of Athlone, at total cost of £2,500. We understand that a building of somewhat similar arrangements but of larger proportions is about to be erected by them in the town of Tipperary.

The new Roman Catholic church of Louisburgh, Co. Mayo, is progressing towards completion.

The Roman Catholic church at Ballinrobe, for some time in an incomplete state, is to be finished. It is in the Gothic style, and was designed by the late Mr. Pierce, of Wexford, architect.

The model bas-relief for the northern pannel of the Wellington Testimonial is complete in the studio of Mr. Farrell, the sculptor, and represents the eventful moment in the battle of Waterloo, when the Marquis of Anglesey had his leg shattered by a cannon ball. This and the other bas-reliefs will be cast in bronze at Woolwich. The pannels are 87 feet in length by about 7 feet in height, and the figures are life size.

It is proposed to erect a new Scots' church in the city of Cork, and £1,400 was recently subscribed at a public meeting for that purpose.

The works on the Newry and Armagh Railway are being pressed forward by the contractors, Messrs. M'Cormick and Co., who have recently completed the Dundalk and Enniskillen line, and are engaged on extensive works at Birkenhead.

The Earl of Portarlington is about to commence building an extensive wing to his mansion at Emo Park, with a saloon and drawing-room, and sundry internal decorations, which will cost from £5,000 to £6,000. Mr. W. F. Caldbeck, architect; Mr. Thos. Connolly, Besborough Parade, Rathmines, Dublin, contractor.

A new church is to be built at Upper Falls, Belfast, by the Ecclesiastical Commissioners; also by the same Board, one at Kilmachedar, Co. Kerry. Extensive works are to be executed at the churches of Forkhill, Co. Armagh, and Aglish, Cloghane, Co. Tipperary.

The county courthouse at Longford is to be enlarged and altered, and an entrance lodge built to the county gaol.

Additional works beyond those already mentioned are to be executed at Newbridge barracks.

The Committee No. 1, Dublin Corporation, are seeking for contractors for several proposed new sewers, and improvement of some existing ones in the city. Tenders to be in before 10th June.

A new Protestant Hall is to be erected at Waterford, and tenders are invited.

A Bridewell and Courthouse are to built at Newport, Co. Tipperary.

New works are to be built for the Dungarvan Gas Company.

The remaining portion just opened of the Limerick and Ennis Railway is nearly complete, including a heavy bridge over the river Fergus. The terminus at Ennis is in a forward state.

Mr. Meade is building the Commercial Mart in Grafton-street, under the direction of Mr. Rawson Carroll, architect; expenditure, £6,100. Also two houses at Rathgar, for Henry Todd, Esq., and two for Dr. Gray, in same locality.

MUSIC AND THE DRAMA.—During the past month, English opera has been in the ascendant at the Royal, and the Pyne and Harrison troupe have been charming crowded audiences. Coming so quickly after the galaxy of "stars," lately visible in our hemisphere, no artists of mere moderate ability could secure an attentive ear and an applauding hand. Such, however, did Miss Pyne and Mr. Harrison, especially by their excellence, and the other members of the corps, partially succeed in doing, and amongst the novelties produced was Balfe's opera, *The Rose of Castile*, most favourably received by the criticising deities of our National Theatre, an *impresse* almost indispensable to secure success elsewhere. At the Queen's, Mr. Charles Dillon, Miss Isaacs, and Mr. Norton have been delighting the multitude.

The first stone of a villa, which Rossini intends building at Passy, was laid recently, near the promenade du Ranelagh. The maestro himself officiated on the occasion, and placed under the stone an inscription and a medal, which had been struck in honour of his "Stabat." Mme. Rossini concluded the ceremony by planting a rose tree.

Reviews.

Moore's Handbook of Railway Law. London: W. H. Smith and Son, Strand; and Bradshaw and Bradlock, Manchester.

ACTS of Parliament are seldom palatable subjects, unless, perhaps, for certain legal gentlemen of peculiar digestive organs, much less so would they be for us than even the general public, considering our peculiar avocations. If, however, a work readable by any and every person, compiled in a clear and simple manner, divested of abstruseness on the one hand, or wearisome repetitions and puzzling technicalities on the other, is presented, we should—even though its contents might not come strictly within our province—reasonably incur censure were we to decline its perusal or hesitate to advance an opinion on its merits. Such is that before us, and we cheerfully contribute our meed of approbation to a gentleman who has undertaken a Herculean task fulfilling it with peculiar credit to himself, and advantage to the public. As an evidence of the labour incurred in its compilation, we may mention that during the thirty-eight years ending 1858, no less than 1686 special Railway Acts passed the British Legislature, no trifling pile of documents for an author to wade through, even to cull an intelligible abstract. The work opens with a very interesting sketch of the history and progress of railway legislation, to which are added statistical and financial statements, comprising mileage of each gauge, table of employés, expenditure, average working expenses, &c., &c.; and we may also notice that much valuable information is contained in this volume for railway engineers respecting the standing orders with regard to deposit of plans, the regulation of level crossing, arches, viaducts, tunnels, drainage, fencing, junctions, &c., &c., without lightly passing over the quantity of valuable *materiel* of a more immediately legal character with which the work is filled. The author, Mr. Moore, is Secretary to the Dublin and Wicklow Railway Company, and distinguished for his efficiency, coupled with a courtesy and affability occasionally but not *always* to be met with amongst railway officials, and was formerly assistant secretary to the Poor Law Commissioners, author of "A Compendium of the Irish Poor Law, &c."

Town Swamps and Social Bridges. By George Godwin, F.R.S., Editor of *The Builder*, &c. London: Routledge, Warnes, and Routledge.

HAD the work before us been compiled by a mere essayist in philanthropic and sanitary pursuits, a special analysis of its claims for favour should have been rendered desirable previous to our hazarding an opinion; but when we come to review the production of an author who has laboured indefatigably in a certain cause, collecting incontrovertible data and material during many years of careful observation, and thereby acquiring a justly-earned celebrity, the case is altered, and criticism almost becomes unnecessary. With a view of ameliorating the condition, social and sanitary, of the low London poor, the author has penetrated into the dark mysteries which are to be found even in that metropolis, illumined by the wealth, beauty, and talent of the world, and has succeeded—by bringing to light startling facts—in thoroughly verifying the old saying that "not one half of the world knows how the other half lives." Mr. Godwin, in his conduct for many years of that able and popular periodical, *The Builder*, has systematically and in a series of articles maintained the necessity that exists in our towns for important sanitary reform, for spacious and well-ventilated dwellings, effective sewerage, &c., &c.; but not simply content with advocating improvement as a theorist, he applied himself practically to the illustration of results arising from non-observance of the fundamental principles which sustain animal life, and which in the social scale are calculated to raise man above the inferior branches of creation. These articles, with many additions, have been reproduced in book form, under the respective titles of "London Shadows," and "A Glance at the Homes of Thousands," to which latter the book now before us is a sequel, and they are well worthy the perusal of every well-wisher to the community. If we might express a regret, we should proclaim it a pity that a work having objects of such a laudable and permanent tendency should have been presented in so perishable a form. The contents, however, will outlive the cover, and we wish it may be read extensively.

The Masons, Bricklayers, Plasterers, and Decorators' Practical Guide. Edited by Robert Robson. London: James Hagger.

THE first few numbers (1, 2, and 3) of this work have come to hand, and though we cannot judge of the whole by a part, we nevertheless believe ourselves to be in a position to offer a few comments upon it. The author of a book presumed to be intended for *practical* instruction to the working classes should keep that object strictly in view from first to last, and not attempt too much otherwise, by way of variety. To construct is *one* thing; to design *another!* In the *one*, instruction may be imparted unsparingly, but in the *other* slowly, systematically and judiciously. Workmen are wont to overrate

CLARK AND CO, ORIGINAL INVENTORS AND PATENTEES OF REVOLVING SHUTTERS.

CLARK'S NEW PATENT SELF-COILING REVOLVING SHUTTER, FOR SHOP FRONTS AND PRIVATE HOUSES, AT **2s. 6d. PER FOOT.**

MESSRS. CLARK and CO., of 15, Gate-street, Lincoln's-inn Fields, have recently introduced a New Self-coiling Revolving Shutter, for which they have obtained Royal Letters Patent, which, in addition to being one-half the expense, has the advantage of being remarkably simple, and, consequently, less liable to get out of order. All the complicated gearing apparatus is dispensed with: there are neither wheels, shafts, rollers, cords, nor weights, to become deranged.

We are disposed to think they will be largely used, both for shop fronts and private houses. Much of the difficulty now often found in providing shutters for large bow-windows may be obviated by their use, without extra cost.—*From the "Builder," June 26th*, 1858.

PROSPECTUSES, WITH FULL-SIZED SECTIONS, SENT POST-FREE, WITH NUMEROUS TESTIMONIALS.

CLARK AND CO., ENGINEERS, 15, GATE-STREET, LINCOLN'S-INN FIELDS, LONDON.

W. WARNE AND CO.

CALL the attention of Engineers and others to their PATENT MINERALIZED and VULCANIZED INDIA-RUBBER, in Sheets, and for Valves, Washers, Railway Buffers, Bearing Springs; Hose Pipes (delivery and suction), Flexible Tubings, Driving Belts, and to their improved Anglo-American FLEXIBLE CANVAS and INDIA-RUBBER PACKING, for Steam Joints and Piston Rods.

SOLE MANUFACTURERS OF THE
NEW PATENT MINERALIZED KAMPTULICON,
AND OF THE
MINERALIZED INDIA-RUBBER SOUNDLESS CARPET CLOTH,

Combining Extreme Flexibility, and consequent non-liability to cracking; Durability and Impermeability to Wet; warmth to the feet and softness to the tread.

SOLE MANUFACTURERS OF
WARNE'S NEW PATENT INDIA-RUBBER MATS.

These Mats consist of Tubes of India-Rubber, of various configurations, placed vertically in contact with each other, and are far more efficient than any other description of Mat. No ordinary wear can sensibly affect them; they thoroughly clean the feet like a brush, and the dirt removed falling through the cells formed by the tubes, is not carried by the feet on to the floors and passages, which are consequently kept perfectly clean; and by removing the Mat, the accumulated dirt is easily swept away. They are also made with backs.

The Mats never clog, require no beating, and are readily cleansed by water. Unlike all other Mats, water in no way injures them, and it neither lodges on or is absorbed by them. Indestructible by damp or wet, these Mats, made to any shape, size, or thickness, are especially suitable for uncovered passages and out-of-door purposes.

The invention is peculiarly applicable for Mats for Baths, Conservatories, Laundries, Sculleries, Ships, Steamers, Omnibusses, Carriages, and Seats, also for Churches, &c.; and for Scrubbing Brushes for Decks, and Wooden and Stone Floors, and for Housemaids' Mats.

All Mats are marked W. WARNE and CO., Patentees, London. Orders received at the London Warehouse, 9, GRESHAM-STREET WEST, E.C.; or at the Factory, TOTTENHAM, N, MIDDLESEX.

The Dublin Builder.

VOL. I.—NO. 7.

THE CASTLE OF AUGHNANURE, CONNEMARA.

THE road from Galway to Oughterard runs thro' a wild mountain district, in many places bearing no vegetation whatever — the surface shewing, as far as the eye can reach, little save the limestone strata which everywhere presents itself to view, sometimes occurring in large, rude and irregularly detached masses, but more frequently appearing as if strewn by nature's hand with giant pebbles in her playful moods; while here and there enormous boulders of granite, with lesser ones of freestone and sandstone, are scattered with an unequalled profusion. Occasionally the limestone crops out from the surface in steplike form, strongly reminding us of the Giant's Causeway from the sea; and were it not that occasional valleys and terrace-like slopes are clothed with luxuriant vegetation, appearing like so many oases in the desert, we could easily impress ourselves with the notion that the entire district had been but a few days lifted from the depths of the Atlantic, where it had lain submerged for ages; this more forcibly presents itself to view on examination of the surface stone, which shows the freshest appearances of their gambols with the waves in their original ocean bed.

A recent ramble of ours in the wilds of Connemara led us to the town of Oughterard; here the river Feough, a mountain torrent, dashes impetuously over numerous obstructions of rock forming itself in a succession of magnificent falls through the highly picturesque grounds and romantic dell of Clareville. Immediately under the cottage of the late celebrated Dean Kirwan the current has completely washed away the lower strata of limestone, leaving overhanging ledges of rock covered with plantation to their summits, and projecting fully twelve feet over the stream, looking like the ruined arches of gigantic viaducts of a former period overgrown in their decay.

Following the course of the river towards Lough Corrib, and passing through a portion of the estate of G. O'Flaherty, Esq., of Lemonfield, and of John Doig, Esq., a hardy Scotchman and recent proprietor, we cross a natural bridge which has been hollowed out by the continuous percolation of the waters underneath, and deriding, in the solidity of its construction, some of our most modern engineering works; then, after traversing a distance of about two and a-half miles, we arrive at the Castle of Aughnanure—in Irish, "*Achana nu-re*," "the field of the yews," so called from the number of trees of this genus which formerly grew in the locality; one alone of their number now survives—an isolated and truly venerable specimen—with its scathed and timeworn trunk of many centuries overgrown with pendant ivy, yet exhibiting in the undergrowth from its stem an amount of vitality scarcely to be credited when considering the traditionary age assigned to it.

Edmond O'Flaherty, Esq., the present proprietor, in shewing us over the ruin, called our attention to the numerous young trees of yew which he had planted, and which he informed us were presented to him by Dr. Willis, of Dublin, a zealous antiquarian, as a memento to perpetuate to future generations the derivation of the name of the locality.

The castle itself, a square embattled structure, stands upon a slight eminence over the river, and must have been a place of very considerable strength and importance, surrounded by its bastioned courtyard and loopholed towers, entered by an embattled gateway and portcullis with its attendant drawbridge; no vestiges of either of the latter uow remain. The style of architecture is an intermixture of later Norman and early Tudor, and presents an unequalled specimen of the homestead of the Irish warrior chieftain of about the period of Elizabeth. The great kitchen, with its enormous fireplace, its huge cellars and culinary offices, with accommodation for numerous retainers, surround the dwelling, while the remnant of a magnificent banqueting-hall exhibits a *penchant* for architectural grandeur scarcely to be expected in feudal times. One flank of this building alone remains, the other having been undermined and washed away by the mountain torrent which flows underneath the castle.[*] The window mullions of the existing flank are still perfect, the jambs and soffits of which are richly and elaborately carved—the vine, with its clustering bunches of grape, forming a prominent feature, as if to attest the magnificent hospitality of its former proprietors.

Entering the castle through a deeply embayed doorway, our attention was particularly directed to the intrados of the arches of the dungeon keep, still shewing the remains of the centreing (and this appearance presents itself more forcibly in the adjoining double stone-roofed barbican), displaying their construction upon wattles or basket-work, the mortar still presenting nearly the same appearance as when the centres were struck, but indurated and coated over with the stalactite formation of ages. The mezzanine floors between the dungeon keep and arched ceiling of the principal rooms have all disappeared; an immense fireplace in what was the principal apartment, with its chiselled and corbelled dressings, shews that turf was consumed in vast quantity in these ages. Ascending by a winding stairs loopholed on two sides, and built in the solid wall, with its newel chiselled in the limestone (and which, with the exception of a few steps having given way, is in a good state of preservation), we reached the arched floor over the chieftain's own apartments, and thence ascended to the embattled parapet, from which we obtained a magnificent view of Lough Corrib, tinted in a deeper blue in the reflection of a cloudless sky, and studded with its countless islands clothed in the richest verdure of June, with their shadows unbroken in the calm waters upon which they appear to float. The roof has entirely disappeared, and no vestiges are there to indicate its construction, if we except the corbel blocks which supported the girders, but these we are inclined to suppose were a later addition, possibly introduced from necessity by the failure of the original stone roof, traces of which may be imagined in the haunchings still shewing on the surrounding walls; around the parapet cullisses or gutters cut in limestone, with their accessory gurgoyles, still remain. Similar gutters with basined heads also occur in connection with the machiolations of the corbelled parapets, as if for the purpose of pouring molten lead on the heads of besiegers.

---

[*] Tradition tells strange tales in reference to this Castle. Our attention being directed to a trap in the floor of the dungeon keep, we were informed that prisoners were consigned after execution through it to their last resting-place, by being lowered into the torrent underneath, where their bodies were rapidly borne off in the stream. Like Dunluce Castle, it has its histories of countless treasures buried within its precincts, on the summit of its arches, and beneath the waters which flow within its walls, but these form no part of our researches to reveal—possibly their origin may be traced to the fireside tales of a highly imaginative people.

In an ancient manuscript preserved in the Library of Trinity College, Dublin, some account is given of this Castle; the names and occupations of all the followers or retainers of the great O'Flaherty are stated with precision, and it is referred to by the learned Roderick O'Flaherty as affording protection to the Lord Deputy, the Marquis of Clanricarde, when Galway was besieged by the parliamentary forces under Sir Charles Coote, in 1651.

The date of this building is uncertain; all we could ascertain upon the spot was that in the last century the keystone of the arch of the great entrance gateway had the inscription of its foundation still remaining upon it, but this stone has disappeared, and here our information ceased. That its age must be considerable, there can be no question; from its architecture we would assign it to the early part of the sixteenth century, but the banqueting hall must have been a later erection, when the necessities for predatory warfare no longer existed.

The only authentic and unquestioned information we can adduce respecting this interesting ruin, is—its being erected by and recognized for centuries as the stronghold of the O'Flahertys, the great chieftains of Connemara (who are now represented in the family of the O'Flahertys of Lemonfield, direct descendants in the female line through the celebrated chieftainess, Granu Uile); and as pacing through its ruined courtyard—history, with its myriads of recollections crowded upon us—by an easy transition of fancy we peopled the now desolate and beautiful ruin with phantoms of the past. Stretching before us lay the mighty expanse of Corrib; while on our left peered forth heavenward, bathed as in mist at a distance, the giant amphitheatre of the Joyce mountains, heightening the charms of the scene; and far and away over the bronzed heather* and freshly turned upland, the peasantry, with their sunburnt faces and foreign aspect, were engaged in industrial occupations, assisted by women and young girls with their madder-dyed petticoats and hooded heads reminding us of their Spanish origin; and the waters, the mountains, the heather, the upland, and the people appeared with little change as they did long, long ages ago—recalling to us reminiscences of deeds of (we would fondly imagine) the darkest pages in Irish history, of which the spot where we then stood had been one of the occasional theatres.

A paper read at the Institution of Civil Engineers, "On the Permanent Way of the Madras Railway," gave rise to a discussion in which it appears that the simplest form of construction is to be preferred—that is, screwing the rails directly down upon wood-sleepers, because the natives are much given to steal chairs, "fishes," and bolts. It is believed that cast-iron sleepers will be found preferable to wood, especially in hot climates. Iron sleepers answer best in Egypt; and a form known as "trough-sleepers" and "cup-sleepers," having no chair or projecting parts, has been tried for some years on one or two of the main lines running out of London, and with success. On the Midland Railway they were laid near the Derby station, "where they were subject to a traffic of 550 engines, 2400 wagons, and 120 carriages every twenty-four hours;" which may be regarded as a pretty severe test. Sleepers of Scotch fir, properly creosoted, have been found quite sound at the end of sixteen years. Better still is the yellow pine brought from St. John's, New Brunswick, which, after twenty years' use in docks at Liverpool and Sunderland, remains sound and unaltered; and, so far as experience goes, creosoted timber is not attacked by the teredo.

CONTRACTORS' LIABILITIES!!

THE LATE FALL OF A HOUSE IN GRAFTON-STREET.

KEMPSTON *v.* BUTLER.—This was an action brought by Mr. Kempston, the late proprietor of an establishment, carried on at No. 82, Grafton-street, against the defendant, Mr. John Butler, a builder under contract for the erection of the adjoining house No. 83, to recover damages for alleged negligence of the plaintiff in taking down said house in November and December, 1858. The summons and plaint charged the defendent with gross negligence, by reason of which the plaintiff's house fell; and it also stated that Mr. Kempston's house was entitled to rest on the adjoining house, No. 83, and that the defendant having improperly removed that house was liable to make good the plaintiff's loss. There were also counts for breaking into the planitiff's house and carrying away his goods, and in trover, &c. The defences traversed or denied all these allegations, and pleaded to the two last counts, that the plaintiff's goods were encumbering his close, and he took them away, and was justified in doing so, &c. The damages were laid at £7,000.

It appeared that the house in question, No. 82 Grafton-street, formerly belonged to Mr. James O'Reilly, who had expended about £400 on the premises within a short time before he sold them to the plaintiff, who also expended a sum of £100 additional, and continued to carry on the same business, which was alleged to be an exceedingly profitable one. The adjoining house, No. 83, was at this period (March, 1858) the property of a gentleman named Ferguson, but that gentleman shortly afterwards disposed of his interest to Mr. Francis Falkner, of Grafton-street, who employed the defendant to take it down and rebuild it upon a more extensive scale. The defendant proceeded to take down No. 83 in November, 1858; but the case of the plaintiff was, that having neglected to prop or shore up No. 82, as he was bound to do, that house fell in the month of January, by which Mr. Kempston lost a considerable amount of property, &c. The amount claimed for damages was £975 to rebuild the house, and the injury sustained by the loss of business, and the value of the goods destroyed and damaged.

Upon the part of the defendent it was sought to be sustained that the house No. 82, which fell, was a very old one, and that everything was done by Mr. Butler to prevent it from falling, and that, in fact, it came down from the effects of old age, and not owing to any negligence whatever on his part.

Counsel for plaintiff, Sergeant O'Hagan, and Messrs. Lynch, Q.C., and J. J. Murphy; and Messrs Fitzgibbon, Q.C., M'Donough, Q.C., J. E. Walsh, Q.C., Exham and Osborne for the defendant.

The plaintiff at the conclusion of his case, was non-suited on a technicality that the plaint only alleged negligence in taking down defendant's house, and not as a fact that it was his duty to shore up defendant's house. Liberty permitted to apply to the full court to set aside the nonsuit.

We extract the following paragraph on the same subject from the *Freeman's Journal*:—

"We observe that in the case of the house that fell in Grafton-street, the owner has not been successful in recovering the amount claimed from the builder of the next house, the learned judge having directed a non-suit. The decision is a most important one. It has been too much the practice, especially in our trading streets, to build houses against each other, and not self-supporting, as they ought to be. The result is that an enterprising and improving shopkeeper is prevented from altering or rebuilding an old house, because a number of other old houses are resting upon it, and he runs the risk of bringing them down and leaving himself open to actions for damages to an enormous extent, as in this case, where compensation was sought for the actual loss incurred, and in addition for the consequential damage for interruption of business, &c, &c. The learned judge clearly laid down that the parties building were not bound to uphold the other house, or even to prop it. If it had been supported for twenty years by the adjoining house, just for so long had the latter had a just cause of complaint. In future, therefore, each party must look to his own house, and we consider the decision a most beneficial one to the interests of the trade."

THE SANITARY STATE OF BELFAST.—*The Weekly Press* says that some time ago, a paragraph was published with respect to the sanitary condition of London, and upon this statement the Police Committee of the Town Council—or, at least, their officer—made an investigation into the sanitary condition of this town. We are highly gratified to learn that this return will show that Belfast stands in a first-class position when contrasted with other towns in the United Kingdom, and we believe that this is greatly to be attributed to the vigilance of the present inspector—Mr. Lavery.—[This contrasts very strongly with the account to be found elsewhere in this journal, as furnished by our correspondent, which is unimpeachably authentic.—ED.]

---

* This entire district is peculiarly rich in fern—every moorland, dell, fence, and rock being overgrown in profusion, from the stately osmunda regalis down to the humble asplenium tricomanes; to the admirers of these interesting habitats of the wilds, we strongly recommend a visit to Connemara.

Biographical Sketches.

JAMES GANDON.

DUBLIN enjoys a world-wide celebrity for the beauty of her public buildings; and foremost amongst the architects of bygone times, whose abilities were enlisted in her embellishment, stands the subject of our present biography. Unfortunately, although Ireland proudly boasts of many of this great man's realized conceptions, she cannot classify him amongst her own gifted children—of whom, however, in the architectural profession practising at home, there always has been an acknowledged scarcity—inasmuch as Mr. Gandon was born in London, and descended paternally from French ancestors, and his mother was a Welsh lady of the name of Wynne. On the 29th of February, 1742, James Gandon was born, and at the age of seven years was sent to a boarding-school at Batfield, in Herefordshire, where he remained two years, and subsequently was removed to another at Kensington, where he was five years, and early displayed a great taste for drawing, mathematics, chemistry, landscape, and ornamentation. At first his father intended him for the corps of Engineers, but fate had ruled otherwise; for on the coming of Sir William Chambers to pursue his profession in London, young Gandon was apprenticed to this great master, who recognised in his boyish architectural essays, abilities of an uncommon order. Whilst pursuing his studies with him, he was introduced to, and, in fact, became the *protegé* of the late Earl of Charlemont—a nobleman distinguished for his scientific and artistic attainments. Several other valuable friends stepped forward afterwards to aid him in his career, and Mr. Gandon withdrew from his master's office to practise on his own account, as he thus expressed it—"I have now commenced my career, with a determination to make every effort to obtain public approbation."

Some of the young architect's first works were for halls and offices for public companies in London, and he was appointed by the East India Company, architect and C.E. to Fort Marlborough, in the Island of Sumatra; but he subsequently declined the appointment, on account of the climate. In 1776, he, in conjunction with Mr. Woolfe (an Irishman), the Board of Works architect, formed the intention of publishing a continuation of "Vitruvius Brittanicus," commenced by the eminent Colin Campbell, and three volumes of which were published by him. With this work our readers are mostly familiar, and the undertaking may be considered as one of an arduous and formidable character. In 1767, Mr. Gandon exhibited drawings at two public exhibitions, which attracted much admiration. In succeeding years, until he came to settle in Ireland, in 1781, Mr. Gandon executed several works in England of a palatial and domestic character chiefly; but the first work in this country with which his name is identified was the competition for the Royal Exchange, now degenerated into a "City Hall" for the second city in her Majesty's kingdom, in which, however, he was unsuccessful, as Mr. Cooley obtained the work. The Royal Academy, in 1769, offered to give three gold medals for the best designs in painting, sculpture, and architecture, and Mr. Gandon entering the lists as a competitor, "was soon informed, to his very great gratification, his design was declared the best, and that, consequently, he should obtain the gold medal." The subject was that of a triumphal arch; and on the occasion of the distribution the impromptu powers of the competitors were tested, and it falling to the lot of young Gandon to sketch a design for a park gate, he immediately did so, and the Committee, amongst whom was Sir William Chambers, congratulated him warmly on the success of his designs. In 1771, Mr. Gandon married, and became the proprietor of an extensive household. Competing for a proferred premium of 100 guineas for the best design for a lunatic asylum, "The new Bethlehem Hospital," on a very extended scale, with a frontage of 540 feet, and depth of 350 feet, it was unanimously awarded to him by the committee, but the execution of the work was handed over to some man "of mere lath and plaster." This was the last public work for which he competed in England, and it nearly cost him his life, as it became necessary for him to inspect personally each apartment in the old building, where, to use his own phrase, "he encountered the most deplorable cases of the wreck of the human mind," which first caused sleepless nights, horrible dreams, and finally produced brain fever. We next hear of him preparing designs for the new Custom House in our city, and being called on to superintend its erection, he arrived in Dublin on the 26th of April, 1781. At this period of his career, then, we leave him for the present, intending to resume our biography in next number.[*]

ELECTRIC LIGHT.

WE stated a few days ago that an experimental car, bearing an electric lighting apparatus, had been seen in the streets of Paris; hence it may not be uninteresting to explain to our readers the nature of such an apparatus. The principle on which it is constructed is electro magnetism – that is the property which electricity has, under certain circumstances, of producing magnetism, and conversely. Suppose a wire, many yards in length, and clothed with silk, to be coiled round a hollow cylinder, and let a magnetic bar of steel fit like a core in the hollow; then, each time this core is introduced into the cylinder, an electric current passes through the wire; though of short duration, its intensity is proportional to the length of the coil. Again, each time the core is taken out another electric current is produced in an inverse direction; so that by constantly inserting and drawing out the core an indefinite number of electric currents may be obtained. If the core, instead of being a magnetic steel bar, consists of a bar of unmagnetized iron, and an electric current be made to pass through the coil of wire, and then an equally singular effect is obtained; the iron core becomes so highly magnetized that it will raise heavy bars of iron, and the attraction is so great that it requires a strong man to wrench the bar from the magnetized core. This effect, however, ceases as soon as the electric current is interrupted. It is clear from this that it is much easier to obtain a permanent effect, by magnetizing and unmagnetizing a bar in this way than by alternately inserting and drawing out a steel magnet, as in the former method; and the only difficulty that remains is to give the apparatus a convenient mechanical arrangement. This is done as follows:—Suppose a hexagonal frame, placed horizontally on legs, like a table. At each of the angles let there be one of the electro magnets, or cylinders of induction with wire coiled round, above described, and supported by an inner frame, so that the whole may have the appearance of a horizontal wheel, with electro magnets for spokes; only the nave is supplied by a hollow frame. In this hollow there fits a drum, revolving on a vertical axis, and carrying on its circumference eight bars of soft iron, which, in going round, come very nearly in contact with the electro magnets. Now, from what has been said, it is easy to understand that, whenever one of these bars approaches the electro magnet, it is attracted laterally until it comes in front of it, when the action of the electro magnet ceases; but at that instant the attractive power of the next electro magnet commences, and so on. Now as each of the bars thus receive six impulses in one revolution, and as there are eight bars, the number of impulses received in all by the revolving drum is 48, which impulses occurring in a very few seconds produce in point of fact a continuous motion. Now, if the place of the spokes be occupied, not by cylinders of induction, but by magnetised iron bars, the cylinders being fixed on the revolving drum, and their hollows fitted with cores of unmagnetised soft iron — then, each time a cylinder comes in front of a magnet, the soft iron becomes magnetised, and generates a current in the coil, which ceases as soon as the cylinder changes its place. Now, as the motion is continuous, and the revolution rapid, each ceasing current is replaced by another, and so on *ad infinitum*. These currents are concentrated into a common conductor, and by this means an amount of electricity is obtained which will melt an iron wire three yards long and one-fourth of a line in diameter, and perform greater wonders still, according to the power of the apparatus. One consisting of 32 cylinders and 24 magnets, and made to revolve 235 times in a minute, was seen to produce a permanent and regular light equal to that of 230 tapers. Such, indeed, was the intensity of the light produced, that a lighted candle being held against a white wall, not only the shadow of the candle, but also the shadow of the flame was projected on the wall by the electric light. The cost at which electric light of the intensity described might be produced, would not exceed 15 centimes per hour for each apparatus.—*Galignani's Messenger.*

---

[*] We are indebted for the principal incidents in the life of Mr. Gandon the work compiled by the late Thomas J. Mulvany, R.H.A.

Scientific and Artistic Memoranda.

Mr. Mallet, C.E., in an able paper read before the Institution of Civil Engineers, stated that "the larger the mass of wrought iron ore, the more liable is it to the occurrence of flaws on cooling," and that "overmuch forging is a cause of weakness."

Mr. Wheatstone has invented an improvement in telegraphy, called the automatic writing telegraph, by which 500 letters a minute may be printed, with simpler instruments than those at present used. It is now in use at the House of Lords, and at the London Docks. It admits of ready application indoors, and in the field; the Emperor of the French ordered a pair some three months ago. Provided with these, he could flash messages from the front to the rear of his army over a distance of fifty miles.

Mr. Fleming, C.E., has invented a new compound rail for railways, in which he inserts a core to maintain the continuity, and thereby do away with the joints; and the top and bottom of the rails being alike, admit of them both being used for the same purpose.

Mr. Ruskin, in a recent lecture at Bradford, advised artists and manufacturers not to study mere fashion and caprice, but that which is true and elevating; to leave off stealing designs from one another, and seek rather to invent for themselves. [We wish he would promulgate this doctrine in some of our Irish towns.]

Mr. Allan proposes a system of telegraphic communication between England and her colonies and foreign possessions, which shall keep clear of the continent, by means of a submarine line direct from Plymouth to Gibraltar, thence to Malta and Alexandria, and onwards to India. This, as he shews, would render us independent of foreign powers and operators, and enable us to communicate with the more dispatch. Mr. Allan would make his cable with a solid copper core, strong enough to resist any amount of strain, whereby it would be stronger and yet lighter than the Atlantic cable laid last July.

Mr. Hearder of Plymouth says, that as engineers have got over the mechanical difficulties of laying a cable. so electricians should overcome the difficulties that hinder its working. As the result of his investigations on the subject, he states that a cable is best fitted for the transmission of a charge when it has a fibrous layer between the wires and the gutta-percha, or between the gutta-percha layers themselves. Flax or hemp would be a suitable material, and at the same time greatly strengthen the cable. "Such a cable," says Mr. Hearder, "when made of the requisite dimensions, need not weigh more than six hundredweights per mile in air, or one hundredweight in water; and from experiments made with a sample of an analogous construction, the breaking strain would be upwards of seventeen hundredweights, or equivalent to between 17 and 20 miles of its own length in water. It will be remembered that the Atlantic cable would not support three miles of its own length in water; and I question much if the integrity of its gutta-percha coating could be depended on under the strain of a single mile."

SUPER-HEATED STEAM.—Further experiments are making with super-heated steam, and with the advantage—a saving of 30 per cent. The *Valletta*, a steamer belonging to the Peninsular and Oriental Company, has just been fitted with an engine on the super-heating principle, by Mr. Penn, and the result is as described. The temperature of steam, as commonly used in engines, is 250 degrees; the super-heating raises it to 350; and it is by an admission of a portion of this to work with the common steam that the effect is produced. The super-heating, in the present case, is accomplished by a system of pipes in the smoke-box; and we are told that the principle is applicable to all kinds of engines. The coal-bill of the Peninsular and Oriental Company amounts to £700,000 a year; hence a saving of 30 per cent. will add largely to their profits.

By advices from New York we learn that, although the *Ericson* was a failure on the great scale, the air-engine has nevertheless completly succeeded on the small scale. Up to five-horse power, it is as effectual as steam, and not one-tenth of the cost; so that, in American phraseology, "the Ericson air engine is going to wipe every other kind of engine off the slate:" that is, so long as it does not exceed five-horse power.

BELFAST FINE ART EXHIBITION.—The Committee of the Fine Arts Society, having very judiciously determined to admit the working classes on Saturday evenings, on payment of threepence each, a "limited" number of individuals availed themselves of the great privilege thus offered to them. When it becomes better known amongst the working classes, we doubt not but hundreds of them will take the opportunity of visiting this excellent collection of works of art. [We are glad to see that the Society has thus far met "the working classes," but in this age of cheap education, we think they might have gone still farther and reduced the charge to *one penny*, for the prudence of which they have precedents in a metropolitan institution of a similar character.—ED.]

DECIMAL COINAGE.

THE final report of the commissioners appointed to investigate this subject has at last been sent in. The document is published in the form of a blue-book, the bulk of which consists of drafts or preliminary reports, and copies of documents put in in evidence, some of value. but the greater number partaking of the ordinary character of blue-book appendices. The actual report consists of a statement of the reasons in consequence of which the commissioners have decided not to recommend any change in the existing coinage. The following are some of them:—That there appears to be no approach to unanimity of opinion, on the question of the introduction of decimal coinage, in the commercial or other classes of the community. That it is very difficult to come to any useful conclusion as to the merits of the decimal principle in the abstract, distinct and peculiar difficulties attending each separate form in which it has been proposed to introduce the decimal principle into the coinage of the country. That the pound and mil scheme is the only form in which, under the present state of public feeling in this country on the question, the introduction of the decimal principle into our coinage can be contemplated with any reasonable probability of sufficient support. That as regards paper calculations there appears to be a preponderance of advantage on the side of decimal coinage; but the extent of the superiority in that respect may be the subject of much difference of opinion. That as regards the comparative convenience of our present coinage and of the pound and mil scheme, for the reckonings of the shop and the market, and for mental calculations generally, the superiority rests with the present system, in consequence, principally, of the more convenient divisibility of 4, 12, and 20, as compared with 10, and the facility for a successive division by 2, that is, for repeated halving. That as regards the comparative convenience of the coins provided by the rival systems, the advantage appears to rest with our present coinage. That the advantages in calculation and account-keeping anticipated from a decimal coinage may, to a great extent, be obtained without any disturbance of our present coinage, by a more extensive adoption of the practice now in use in the National Debt Office, and in the principal Assurance Offices, viz. of reducing money to decimals, performing the required calculations in decimals, and then restoring the result to the present notation.

NEW CHURCH OF ST. PATRICK, CELBIDGE.—The dedication of this new edifice took place on the 19th ult. It is something more than two years ago since the foundation was laid by the most Rev. Dr. Cullen. It is in the early pointed style of the thirteenth century, comprising nave, chancel, and side aisles, with votive chapels, one dedicated to the Virgin, and another to the holy sacrament. The high altar has a slab or table supported by pillars of Cork red marble. The reredos is similiarly composed of opes and pillars of the same rich materials, with richly wrought capitals. The marble tabernacle is of beautiful design and workmanship, over which rises a canopy to the height of thirty feet, surmounted by a richly carved cross and adorned with figures of angels, &c. The great eastern window over the altar is filled with stained glass of beautiful design, the compartments containing representations of the mysteries of the faith, and beneath pictures of the Virgin, St. Joseph, St. Patrick, and other saints. The arched ceiling of the chancel is pannelled for the reception of appropriate paintings. The aisles are separated from the nave by pillars of wrought sandstone, with moulded capitals, from which spring pointed arches, over which is a high clerestory containing two tracery windows. The west front presents the graceful and deeply moulded arched entrance forming the main portal, above which rise a couplet of lanceolate windows richly adorned. The windows of Our Lady's chapel and the other votive shrines are of splendid design in stained glass, through which light falls upon the interior.—Mr. J. J. M'Carthy was the architect; Mr. Robert Farrell, the builder.

At a recent sitting of the State Council, the Empress Eugenie in the chair, and in presence of ex-king Jerome, it was settled that a bronze column, as tall as that in the Place Vendome, to be formed out of Austrian cannon from Italy, should be set up on Place de la Concorde, with a statue of Napoleon III. to correspond with that of Napoleon I. At Milan, the Arco del Sempione, a marble structure of the first Emperor, is to be completed on its original design, with a chariot of bronze on top, and Napoleon III guiding the team. It is to take the name of the "Arco della Pace."

THE NATIONAL PORTRAIT GALLERY.—Several works have been added to the National Portrait Gallery, London. They consist of Cowley, the poet; Selden, the Marquis of Ormond, Lord Hood, and the seven bishops who were tried and acquitted in James II.'s reign. The two first-named are, however, the only one of these new acquisitions which are yet hung up in the rooms. The others, requiring to be framed, and otherwise prepared for exhibition, will not be exposed to public view for a few days yet.

SANITARY CONSIDERATIONS.

SEWERAGE—NO. V.

HITHERTO we have described in our papers on this subject a succession of failures of plans for remedying the evils of the present sewerage system, and we have pointed out the utter uselessness of throwing away hundreds of thousands of pounds in the shape of lime, by way of "disinfecting" the sewers and obviating the pestilence of the Thames. We have shown the latter operation, carried into effect by the authorities of London, apparently as a *dernier resort*, to be contrary to all scientific and chemical principles, and we prognosticated results which have already proved themselves. Several months back we pointed out the monstrous fallacy of casting lime into the sewers, at the cost of £150 a-day, "to disinfect the river;" but the engineers of London dictated, and the commissioners paid the money, whilst the inhabitants who provide it, suffer the double penalty of payment and pestilence.

The following paragraph—one of several appearing in the London papers within the last month—now tells of the commencement of the odoriferous season of London:—

> "RENEWED SYMPTOMS OF FETID EXHALATIONS FROM THE THAMES.—The medical officer of health for the city of London, Dr. Letheby, states that the Thames has, within the last few days, exhibited unmistakeable signs of offensiveness, but much more pungent than last year. From London-bridge to the point below Blackwall these evidences are already unmistakeable, and call for the immediate attention and interference of the Board of Works or the Conservators of the Thames."

What will the Board of Works or the Conservators of the Thames do? Nothing! The monster sewers now in course of construction will go on, and the rivers and the sewers will, from day to day, give more "*unmistakeable signs of offensiveness.*" When the £3,000,000 already voted shall have been expended, then possibly a new *commission of enquiry* will be established, and, if truth be told, it will be found that every sewer has increased its quantum of filth and effluvium. The Thames will speak out in such noisome language, that even the most sceptical will not doubt, and Dr. Letheby's "*liquid deodorizer*," which is now announced to be in preparation, will have about as much effect as the use of a trident to keep out the tide.

But to our task. We have now to describe the *third* proposition for remedying the sewerage evil, named "*the peat charcoal system*," devised by Mr. Jasper Rogers, C.E.

It would have been well, perhaps, that it had received any other name. There is no doubt that "peat charcoal" has been "a bone of contention" in the scientific world. For some years its singular deodorizing and absorbent properties, now universally admitted, had been almost totally denied, and the groundwork of Mr. Rogers's plans, which are patented, rests upon the power of peat charcoal to absorb and at once destroy all emanations arising from the foulest fœculant matter.

Mr. Rogers assumed in his publications, commencing in 1849, what must be admitted has since been incontestibly proved—namely, that night-soil could not be forced through the sewers by the action of water; and taking that as his data, he proposed a total change—in fact, a return to the original and still recognized principle of sewerage law—namely, that night-soil should be wholly excluded from public sewers. To enable this to be done effectually, he suggested three methods for adoption in existing streets, and one for new streets.

1st—That outside each house, sunk under the flag-way, or in the area, or at the rere of the premises, should be a portable or fixed tank or receptacle, into which the pipe from the water-closet should discharge. At one side of the tank (within it) a compartment contains peat charcoal, and from the bottom of the division a pipe issues to the main sewer. The action is evident. The solid matter remains in the tank; the water, passing through the peat charcoal, is deprived of its impurities by the chemical action of the carbon, and is discharged into the main sewer in a comparatively pure state, whilst the solid matter is retained in the tank, to be converted into a manure, the final deodorization being effected by peat charcoal.

2nd—In the event of portable tanks being inconvenient, his second suggestion is the construction of *one tank*, placed in a vaulted chamber, say at the end of and under each street, to receive the matter of a number of houses, conveyed thither by metal pipes in connection with the soil-pipe from the closet. The principle of the arrangement is the same as already described—the water passing in a purified state into the main sewer, the solid matter being retained and converted, in the chamber beneath the street, "into an *inodorous* compost, capable of being at once packed in sacks, and transported by any conveyance."

The 3rd plan is, to carry through the public sewer of all streets a close metal main or pipe, such as our water or gas mains, into which the closet pipes only shall discharge; these mains to pass into a chamber of cast iron, erected *at the sewer mouth.* The *principle* is, of course, as already described—the filtration and manipulation of the manure being effected in the chamber, and the produce taken away in barges. There is added a very unique proposition for preventing the stoppage of the matter in the pipes, and as we are not aware of anything similar being suggested, we give the following extract, descriptive of the latter plan, from "*Facts and Fallacies of the Sewerage System*":—

> "It will thus be seen that if the house refuse main be adopted, the general sewers would have no impurities passing through them, and there would be nothing to contaminate the water except what it might take up in its passage over the surface of the streets to reach the gully; therefore there would be no future noxious emanations from the sewers, because there would be no sensible noxiousness in them.
>
> "The house refuse mains, made of cast metal, I would carry through every sewer in the metropolis, increasing their diameter as they neared the point of discharge. I would concentrate the falls towards the most facile points, adopting such of the fifty-eight or sixty principal sewer mouths, as might be found desirable, for the final discharge; and at each of these, within the banks of the river, I would construct the filtering and vacuum chambers shown in plate No. 5, into which the mains would empty their contents; and it will be observed that there would be no disturbance of the thoroughfares necessary in order to lay the house mains; the work could be done within the sewer itself.
>
> "Now the first great object gained would be, that decomposition of the matter discharged into this close main would be almost wholly arrested; and the result—no noxious gases could reach the houses, simply because they would not exist in the main, or at most in an infinitesimal degree, from the absence of atmospheric action. Thus, both streets and houses would be freed from poisonous emanations.
>
> "The house refuse main, ending at the filtering chamber, would enter, as shown, near its centre. At this point would be a valve, to cut off the connexion with the chamber when necessary. The solid matter brought by the main would sink to the bottom of the chamber, where, the water being undisturbed, it would naturally precipitate; whilst the water would pass upwards, through the grating shown.

and ascending to its own level through a body of peat charcoal, would not only leave all solid matter beneath, but would be totally divested of its impurity, and might pass away at any time of tide into the river. This is simply provided for by means of tide-valves, which close as the tide rises, and oblige the water in the chamber to ascend to a higher level, before it discharges itself. The tide water, therefore, could never enter the chamber or the mains.

"The filtering and vacuum chamber represented in plate No. 5, is provided with an Archimedian screw, as shown, which extends to the bottom of the receptacle, and is set in motion by the small steam-engine represented on the upper floor of the chamber—up that screw the contained matter continuously ascends as if up an inclined plain; the greater portion of the water, intermingled with the matter, passing out through the exterior of the screw, which is composed of open wire work; and when the matter reaches the mouth of the screw, it is in a semi-solid state. At this point, the final deodorization takes place, by immediate intermixture with peat charcoal—in the same manner exactly as I had the honour of proving before two meetings of citizens of London, in October, 1849, when I first lectured upon my discoveries on this subject—which is described in the certificates and extracts from the pamphlets and papers published at that period.

"From the intermixing machine, the manure will pass at once into a barge, at the side of the tank, in a perfectly deodorized state, without the loss of any of its original fertilizing elements—whilst the removal will take place without the slightest inconvenience or annoyance to the public.

"But I almost imagine I hear some one say, 'Suppose your mains become choked, what then becomes of your proposition?' Well, suppose they do, I shall not be in a worse position, nor as bad a one, as when the sewers become choked at present, which we all know is constantly taking place—when the only possible remedy is to open some half-dozen apertures in the street, until the place of stoppage is discovered—and then to bucket the matter up, perhaps at mid-day, and cart it away—oftentimes with the summer sun beaming on it, as it wends its unsavoury course, not unfrequently through Belgravia.

"Now as regards the stoppage of my mains, a simple blow of a hammer given to the pipe by a workman as he passes within the sewer seeking for the defect, will infallibly tell him, by the sound, where it is; and if there were no other way to remove the accumulation, it would be only necessary to disconnect the one length of pipe in which it existed, when it could be at once removed. Let it be recollected that, even now, the sewers are entered and walked through by workmen; but I trust the day will come when they may be traversed (except in case of floods or storm) almost without soiling a shoe.

"I would now, however, point out another mode provided to prevent stoppage in my mains. In the plate No. 5, will be seen where the pipe, or 'house main,' is connected with the 'filtering chamber:' at this point there is a slide valve. I have already explained that the 'Archimedian screw' lifts all the solid matter out, whilst a pump is arranged to draw away the water remaining at low tide, and the chamber is so constructed of cast-iron plates, bolted together, that it is not only perfectly air-tight, but strong enough to resist, at all points, the full amount of atmospheric pressure, when a vacuum is produced within; and the area or cubic contents of the chamber should be in proper proportion to the cubic contents of the pipes discharging into it.

"Now, suppose that a stoppage take place in any part of the pipe or main. The slide valve where it joins the chamber is screwed close; the valve at the exit passage is also secured, and whatever water remains in the chamber is pumped out.

"This being accomplished (and it would be an operation of no moment, because the process of removing the soil from the chamber would be continuous throughout each day), an air pump would be set in motion by the engine, and as soon as a perfect vacuum were produced in the chamber the slide valve would be lifted, and I need scarcely add that everything in the mains connected with the chamber must rush towards and into that vacuum, until it no longer exist.

"Thus, I believe, I have provided an arrangement which would not only effect its object in cases of need, but which is capable of being put into operation, without any difficulty, every twenty-four hours, if found desirable. A novelty, no doubt, and liable, therefore, to objection; but still, perhaps, not unworthy of practical test, as grounded on one of nature's most powerful laws."

The fourth plan is that for *new streets.*

It is proposed, that in place of a sewer, as at present under each street, an arched vault, or *dry tunnel*, be constructed, about six feet high and three feet wide, with a footway at bottom, formed of flags about an inch apart, to permit drainage, these flags forming the covering of an inverted circle or sewer, of about two feet diameter, under the footway—this sewer being intended to carry away the surface and drainage water from the streets, but nothing else. Through the tunnel it is proposed to lay the water mains, gas pipes, electric wires, &c., also a metal pipe, called an excretary or *house refuse main*, into which the closet pipes would discharge in the same manner as already described. By this means it is proposed, not only to obviate the evils of the sewerage system, but to prevent all the others which we now suffer from through constant disturbance of the surface of our streets—for laying and repairing the several mains, for cleansing the sewers, &c., &c. The space within the tunnel would be ample to permit ready access for workmen; the slightest escape of gas or water could be detected; repairs executed at comparatively trifling cost; and, inasmuch as the surface of the streets need never be disturbed, the repairs of thoroughfares would be infinitely less than at present.

Such are the leading points of the *third proposition* for remedying the evils of the sewerage system; and which we have, as faithful chroniclers, to add to the list of *failures*, inasmuch as it has failed to obtain public support. Why, we confess we are at a loss to decide, particularly as the merit of the "*dry tunnel*" or sub-way plan has been fully recognised by three of the leading engineers of London, and by the Metropolitan Commissioners, and *a prize granted for it*, as may be seen by the following paragraph from a contemporary:—

"The publication from which we have taken the description of Mr. Rogers's peat charcoal filter and apparatus for intercepting sewerage at the sewer mouth is dated 1857, and the patents had been long previously secured, consequently Mr. Rogers's cannot be deprived of the advantages of his invention and genius; but it is a singular fact that this is the second time his plans respecting the sewerage arrangements for London, &c., have been brought forward by Londoners as their own. We recollect attending Mr. Rogers's lectures, given at the Dublin Society House, on the Sanitary Improvement of Dublin, when he produced an admirably executed diagram of his design for *dry tunnels for new streets*, through which should be laid the water, gas mains, and electric wires; and a *House Refuse Main* and filtering apparatus, by which arrangement all impurities from the sewers would be prevented, and all further breaking up of the surface of the streets rendered unnecessary. We happen to have before us a copy of the *Commercial Journal*, with a full report of that lecture, still, although it was subsequently published for the Sanitary Association, and copies sent by that body to the metropolitan courts of London, the commissioners gave to a Mr. Davis a prize of 100 *guineas*, for an almost literal copy of that plan and diagram after it had been published in London, as one of the plates attached to Mr. Rogers's 'Facts and Fallacies of the Sewerage System.'"—*Freeman's Journal.*

We are aware of other instances where our good neighbours of London have appropriated to themselves things that did not belong to them, but in this instance we confess astonishment at so barefaced a plagiarism succeeding in obtaining the reward from the person really entitled to it, *although an Irishman*—and we confess also at a loss to understand why so easily tested a general proposition as that made by Mr. Rogers, *has not been tested;* particularly when we find such an offer made as follows, which we extract from a letter from him, published in the London papers, addressed to the Committee of the House of Commons appointed to inquire into the state of the Thames:—

"The facts, certificates, &c., set forth in the publication submitted, will, I believe, testify as to the feasibility of my proposition, and I shall only take the liberty of adding on that score, that, if they obtain support so far as to steps being taken for publicly testing their assumed advantages, an ample supply of Peat Charcoal shall be at command, free of all cost, for the purposes of one tank and

apparatus to be erected at the mouth of any London sewer, with metal mains, laid through any district or street; and all working plans, details, &c., shall be supplied by me for experimental operation, which would be simple, and of moderate cost."

We have a strong impression that if these propositions had been made by a *Londoner*, they would have been long since adopted—at least tried. It appears to us that when so many facts exist to bear out the theory, and when the test is so simply and inexpensively within reach, that there is little justification for not adopting Mr. Rogers's offer, which we find reiterated in several parts of his publications and letters to the London authorities. Proofs that cannot be questioned have been given of the deodorizing properties and disinfecting powers of peat charcoal—its singular capability in filtration, its value as a fertilizer, &c., &c. These are now established realities. Why, then, should so simple a means be left unnoticed, while such gigantic ones are put in essay against the proofs of all experience to the present moment?

But for the present we close. We have faithfully described all that has been hitherto done to damage or to remedy the sewerage. We shall return to the subject. We should wish much to hear the opinions of others on what we have disclosed, and whether we have erred in the descriptions given. There is, perhaps, no subject of more vital importance to the welfare of the general community.

It is now in the hands, we may say, of a clique in London, and, like the unhappy flock of sheep that wait to see *one* begin to nibble the turnips, although half starving whilst they wait; the community wait to see the result of the London monster sewers. No one appears to have courage to go out of the beaten path, notwithstanding that it is about the foulest and filthiest that ever was travelled; and the influence of the men in power in London who have committed themselves to the fallacious plans now in use, is so great, that we can scarcely hope for a change *there* until it becomes *unbearable*, as we believe it in time will under the present *regime*. But why we in Ireland should blindly follow the fallacies of London, we cannot comprehend, nor do we think it is creditable to our nationality and talents.

ARTISTS' COPYRIGHT, AND PHOTOGRAPHIC PIRACY.

AN important decision has recently been given by the Master of the Rolls at Dublin, in the case of *Turner v. Robinson and Egg*, wherein, a petition had been filed to restrain the respondent from exhibiting, publishing, selling, or exposing to sale, or in any way parting with the photographic picture entitled "The Death of Chatterton." The petitioner submitted that he possessed the exclusive right of copying this picture painted by Mr. Wallis, exhibited at the Royal Academy's exhibition in 1856, and of which it was alleged that the respondent, Robinson, had made photographic copies. Mr Augustus Egg purchased the painting with the exclusive right (as the petitioner stated) to engrave, print, and publish it, and by an agreement entered into between petitioner and Mr. Egg on the 18th of March, 1859, this right (as was alleged by respondent) became vested in petitioner, but prior to this agreement an illustration from the picture had been published in the *National Magazine*. Subsequently the picture had been exhibited at the establishment of Mr. Cranfield, artists' warehouseman, Grafton-street, in this city, and was, both from the nature of the subject, and the meritorious character of the painting, an object of much admiration. The respondent being a photographic artist of much eminence, and, doubtless, seeing a favourable opportunity for a lucrative speculation, bethought himself of producing stereoscopic views in imitation of the original picture, and for that purpose procured a living object, resembling in appearance and similarly clad and posed, to personate the *dying poet*.

The following able judgment of the Master will fully describe further particulars:—"It was quite plain from the importance of the question at issue that the injunction should be continued until the hearing of the cause. Suppose that Mr. Wallis had never sold this picture, but exhibited it at Mr. Cranfield's for the purpose of engraving, would he in that state of facts have a right to sue? He had a very strong opinion (though he admitted the question had never been the subject of decision) that the painter had by common law the very same protection which the author of any work enjoyed previous to publication. Surely nothing could be more unjust than to say that if a painter gave the public the privilege—and a very great privilege it was in some cases—of allowing them to see a work of art in his studio, a person who had thus inspected the picture, having a good memory, and being an artist himself, would have a right to endeavour by some contrivance to make a copy of that work—for instance, by getting his apprentice, as was done in the present case, to dress himself up in a peculiar manner, so as to represent the principal figure in the painting, and then take a photographic representation of the subject, composed in imitation of the picture, and representing it in terms by advertisement as a copy of the picture. This had been done in the present instance—the photographic pictures sold by the respondent having been advertised in the newspapers as 'The Death of Chatterton.' He looked upon this as nothing short of a fraud, a deliberate fraud; and he had not the slightest difficulty in holding—on the principle laid down in the case of Prince Albert *v.* Strange, which was the principle of common sense, and in the admirable judgment of Mr. Justice Erle in the case of Jeffrey *v.* Boosey—one of the ablest judgments that had ever been delivered—that it would be the bounden duty of a court of equity to interfere in such a case, quite irrespective of the common law right of the painter to sue for damages, which right he would have as long as he had not published the picture. The question then arose whether there had been a publication of the picture; because, if there had, then considering the principle laid down in the case of Jeffrey *v.* Boosey, it would be very questionable what the law might be. He had no hesitation in saying that the exhibition of the paintings at the Royal Academy was not such a publication as would deprive the artist of his right. It was a qualified publication—it was a privilege allowed to the public to see works of art. Did any one suppose that if Sir Walter Scott read out one of his productions to a number of his friends, and that one of them had such an accurate memory that he could reproduce every word of it, or that some one was in a corner taking notes in shorthand—did any one suppose that in such a case the reading of the work would amount to a publication so as to give the person who had taken notes a right at common law to bring out an edition of the work? In an analogy to that case the exhibition of a picture at the Royal Academy, or at Mr. Cranfield's, or elsewhere, for the like purpose, would be nothing more than a qualified publication, which would not deprive the painter of his remedy at common law or in equity to prevent a party from the commission of a fraud in attempting to copy the picture. A difficulty, however, as to the third point—namely, that there had been a publication in the *National Magazine*. But for that publication there would not be any serious doubt in this case. He was not prepared to say, nor did he wish at present to offer an opinion on the matter, what was the effect of that publication in the *National Magazine*. If the respondent had simply confined himself to copying that engraving it was questionable whether the petitioner would have any cause of action against him. But he had not confined himself to merely copying the engraving; he had undoubtedly used it in the preparation of the photograph, but he had also adopted the colouring of the picture for the purpose of inducing the public to believe that the photograph was taken from the picture itself. He thought this was a fraud; he did not use the word in an offensive sense, but a fraud in contemplation of a court of equity. He might entertain some doubt as to whether the photographic pictures produced by the respondent would be a serious injury to the owner of this valuable painting; but if this were overlooked the photograph might by a very easy process be enlarged to the size of the original, and thus an unimportant piracy might be followed up by the adoption of another mode of piracy which would be most injurious to the owner of the painting. His Honour concluded by saying that he would continue the injunction, but he would not draw up his order for a few days until the petition had been amended as suggested.

Mr. Sullivan, Q.C., said that Mr. Robinson had published advertisements in the newspapers that the photographs were not copied from the picture.

The Master of the Rolls—A great many persons may have read the first advertisement that the photograph was taken from the picture, who never saw the subsequent one contradicting that statement.

The discoveries lately made under the church of St. Clement, in Rome, consist of an aisle, 150 Roman palms (112 feet) in length, with five columns still standing, remains of mural painting, the fragments of an ancient mosaic pavement of the Constantinian period, and a sepulchral inscription found in the ancient porch, and bearing the date of the Consulate of Orsus and Polemius, namely, the year 839.—*Civilta Cattolica.*

SANITARY STATE OF BELFAST.

Belfast, as many of our readers are aware, is chiefly built on the delta formed at the embouchure of the River Lagan. The greater part of the streets of the town are only raised a few feet above the high-water level, some on the same level, and parts of others even below that level. Many of the streets may be said to have no sewerage whatever, as the old sewers when opened are found to be filled with a hard, dry, black residuum, up nearly to the top of the soffit of the arch, which can scarcely, from its hardness, be dug with a spade; in other cases which we have seen, it is about the consistence and colour of tar; some of these are opened now and then, and cleaned out. In some of the principal streets new sewers have been built at a low level, perhaps about that of ordinary neap tides, and the mouths of all those which are connected with low-lying districts, liable to be flooded at high water, are provided with valves to prevent the ingress of the sea, and during part of the time are in fact cesspools. A portion of a new sewer was built in High-street some four or five years ago, but after being carried up so far as Sugar-house entry, the work was abandoned. A small rivulet runs down this street, and the arch over it is so old and imperfect, that holes in the middle of the street are of no rare occurrence, but as the bottom is filled with small boulder stones, and not more than two or three feet below the surface of the street, no serious accident has yet occurred. All the sewerage of the town is ultimately discharged into the Lagan river and the harbour, and only that the sewerage is very imperfect, and water-closets very far from being universally adopted, they would rival the Thames in impurity. The quantity of sea and river water, however, so far exceeds the sewerage, that, in its diluted state, it has not hitherto been much complained of. Such, however, is not the case with the Blackstaff and Pound Burn. In the summer and in times of dry weather, they become open sewers of the most filthy and obnoxious kind. The improvement of the Blackstaff river has been a subject of consideration in Belfast for the last twenty years. Engineers have been consulted, and very various have been the remedies proposed; lawyers have been feed, briefs written, acts of parliament obtained, but all in vain—there it still flows with all its impurity, blackness, and disgustfully poisonous effluvia. The Pound Burn and a goodly number of open ditches are no less offensive and injurious to health.

Many of the lanes and streets are narrow; some of the former not four feet wide. Ill-ventilated courts and cul-de-sacs abound All the slaughtering required by a population of 120,000 persons is carried on in the heart of the town, chiefly in the rere of Hercules-street, where the poorest population and the greatest crowding exist. Not one of the trades obnoxious to health—such as starch-makers, soap-boilers, bone-grinders, &c.—have yet been banished from the neighbourhood of human habitations.

The town council themselves create no inconsiderable amount of nuisance in several quarters of the town by the huge dunghill which they collect, and store up for months for sale to the farmers.

Well, notwithstanding all these untoward circumstances, natural and artificial, hear what an efficient sanitary inspector can do:—

"Health of the Town.—It is gratifying to be able to state that the health of the town contrasts very favorably with that of Belfast several years ago, or even of other towns at the present time. Contagious diseases are hardly known; fever has almost disappeared—indeed, we have reason to believe, that, leaving the Union Hospital out of the question, a dozen certified cases of fever could not be found in Belfast out of a population of 120,000. This satisfactory state of things is principally to be attributed to the excellent sanitary precautions which have been made by the appointed officer of the town council, Mr. Lavery, and his staff, who by their vigilant and unceasing exertions have made Belfast the most healthy town in Ireland."—*Northern Whig.*

This is not the first *puff direct* which we have seen in the Belfast papers touching the ability with which Mr. Sanitary Inspector Lavery discharges his duties. Was the sanitary condition of Belfast never properly looked after until the appearance of Mr. Lavery? Did Surgeon Brown, R.N., when sanitary officer of the town some years ago, not discharge his duties faithfully and efficiently?

A writer on the sanitary state of Belfast seven years ago says:—

"The chief desiderata are: improved drainage, more copious supply of water, great attention to the removal of all which gives birth to malaria and animal poisons; the entire destruction of tenements where foul air, filth, and disease cannot but dwell together and hold carnival; the throwing open of our miserable courts and entries, the majority of which are shut in, as if purposely to exclude the light and air of heaven—mere cul de-sac or blind alleys without any thoroughfare to secure ventilation; removal of slaughter-houses; the provision of parks and places of public open-air recreation for the children of toil, many of whom are doomed to spend the greater part of every day in an atmosphere wholly unsuited to the animal economy."

Now, of these desiderata how many have been effected? We believe not one; and yet we are to believe that the town is in a sanitary state superior to anything Irish, at any rate, merely by the appointment of this inspector and his staff. Will the town council be able to persuade a committee of the house of commons that they have discharged their sanitary duties simply by the appointment of inspector Lavery, whilst they have not yet provided remedies for the evils which we have enumerated. The whole district of Ballymacarrett and several others are still without public sewers. No effort has been made to erect a public abattoir; nothing has been done to remedy that monster nuisance, the Blackstaff and its tributary the Pound Burn, which might be easily done by reverting to the wise laws of our forefathers, and permitting nothing to go into an open river save pure water, sewers being provided to carry off all impure liquids. What have they done to provide public baths and wash-houses? There is no public institution more desirable than this, and yet they repudiate the responsibility of supplying them, although a rate has been levied for the purpose, and the proceeds in their treasurer's hands. Some years ago it was not only possible but pleasant to bathe adjacent to the town, in the lough; but the railway companies and the harbour commissioners have completely cut off the inhabitants from this healthful recreation, except at the risk of life. We say it is the duty of the town council to remonstrate with these selfish bodies, and cause them to provide free access to the waters of the ocean in several and suitable places, on the coast. What have the town council done in respect to the people's park? We say decidedly that they represent the people, and should take action on their behalf, and secure and prepare a place for their recreation, where a "toil-worn, sickly, miasm-breathing population" could enjoy a little of the fresh and free air of heaven. It is their duty to allure the poverty-stricken and the toil-worn artizan from those close courts and lanes and dismal abodes, into places where the air is pure, and dram-shops absent, where such have been created, and also to attribute the present health of the town more to the bounty of Providence than inspector Lavery.

T.

COMPETITION MATTERS.

It must be very evident to all who reflect on the fact that 109 architects competed for the premiums offered for designs, &c., for the Manchester Assize Courts, and that out of these 109 only three received any remuneration for the serious amount of labour and study necessary to produce those designs, that a vast amount of unproductive labour has been called forth by the competition. This fact also evinces that the members of the profession are much more numerous than the wants of the country demand. Architects find it economical, convenient, and often lucrative to take apprentices without any limit save the want of supply; hence the numbers in the profession are fast outgrowing the means of employment. Can the profession, as a body, do anything to put a stop to this? or is it the better course to allow the evil to create its own remedy? Tradesmen are similarly situated, and make vigorous efforts to prevent their own multiplication beyond the wants of the country; but they form themselves into unions, and act in concert. The architects of this country are a *disjuncta membra*, a disunited body, often meanly jealous of each other's success; still, a common danger should compel unity, unity would give strength, and more frequent intercourse consequent on unity would have a humanizing tendency. *Mais revenons a nos moutons.* Competitions, as hitherto conducted, bear in many respects a strong resemblance to a lottery—the author of the very best plan cannot predicate with any certainty that he will obtain the highest prize—all are induced to spend their time and give their labour for the chance of a prize; and in the case to which we have already alluded, 106 architects gain nothing but disappointment. Nor can it be even said that the committee have gained their object; the premiated designs are by no means faultless. No one design possesses supreme excellence in all points, and scarcely any of them which do not possess some point of excellence. If the committee had been fully qualified to instruct an architect on the subject, clearly explaining to him what in all respects they required him to produce, nine-tenths of the competitions would have exhibited designs equal, if not superior, to any of the premiated ones. It seems that when a committee want information to enlighten them as to what would best meet their requirements, they appeal to the profession at large for this information, which they not only seek, but seek at a price much below its value; some committees go so far in this direction that they offer no chance of remuneration whatever.

The guardians of the Blackburn union offered lately a bonus!! of £50 for the best approved plan, with elevations and sections, general specification and estimate in detail, for a building to cost £12,000! The charge for an estimate in detail is one per cent., and the plan &c., and specification would not be less than two per cent. In this case the guardians ask the profession to give them £360 worth of their services and they will pay them with—stop! not pay—they will give them a BONUS of £50!

But the guardians of the Blackburn union were exceeded by those of East Grimstead, who condescendingly notified that they would receive plans with specifications for a building to cost £6,000, making no mention of reward or remuneration of any sort.

We do not, however, intend that there is anything wrong in asking professional men, or any other men, to give their time and labour, and place their arduously acquired knowledge at the service of others, without offering them reasonable remuneration for their services; and if there are a number of architects who are willing to take employment on these terms, there are no means of preventing them doing so, in the present posture of affairs. But, undoubtedly, this is an evil to the profession at large. As we have already said, there is scarcely a trade the members of which have not found it absolutely necessary to unite for the common good. Let architects do the same; let them form an association, embracing all members of the profession, for their mutual protection and mutual interests; let them bind themselves not to compete, unless on conditions being offered which shall be considered by the governing committee of their body to be just and reasonable, and let one of the conditions be, that they shall be made by non-competing architects. And we would suggest that there should be only one premiated design, and that a small sum should be given to each competitor who has complied with all the regulations; that the amount of the whole should not be less than would be paid for the same plans, &c., in the ordinary way.

Of course we are aware that there exists a "Royal Institute of Architects in Ireland;" but we believe that it is a very limited body compared to the whole profession, and chiefly confined to Dublin architects. Regarding its influence and beneficial action, we cannot speak, as we confess our ignorance of anything it has ever done for the general good of the profession; locally in Dublin it may be useful, but not in the provinces. We commend this matter to the consideration of the members of the architectural profession generally.

M.

NEW FLOOR COVERING MATERIAL.—The production of a good, durable, and cheap covering for floors, embracing the advantages of softness and elasticity, has long been sought for. The London Mechanics' Magazine states that a very original material for floor covering has recently been patented by Mr. Dunn, a member of C. Goodyear's Indiarubber Company, London, which meets all these conditions. It consists of a composition of silk, flock, cotton, and other fine fibrous materials, of various colours, mixed with india-rubber. These are spread on a canvas back and embossed. The result is a material of great permanence and beauty, having all the softness of a carpet, with the elasticity and noiseless tread which constitute the beauty of a real "velvet pile Brussels."—*Scientific American.*

THE NORTHERN SUBURBS—CLONTARF!

WHILE the southern suburbs of Dublin are rapidly spreading, and becoming populous, there is if possible a retrograde movement in the northern. Why such should be we know not, unless that it *may* be a lack of encouragement by lords of the soil, which deters capitalists and others from embarking in building projects. If the southern side has its advantages over the northern, the latter has its likewise in return; and it is much to be regretted, therefore, that, at a period when progress marks the way in our city and immediate vicinity, that one portion should be so palpably backward while others go a-head.

Our remarks are peculiarly applicable to Clontarf, a locality replete with historic and natural interest, combining proximity to and easy access from the metropolis with the beautiful scenery contributed by our noble bay and mountains; an expansive shore offering facility for the healthy luxury of sea-bathing—so eagerly and vainly desired by the inhabitants of other cities—and a succession of beautiful avenues thoroughly sheltered from every unkind blast, and forming a continuous shady grove.

Some of the habitations—along the line of road especially—are in a most dilapidated state, others roofless, and again, others patched up each spring, and exhibiting a painful shift to make them commonly tenantable as "*lodgings*" for those who are compelled during the summer months to seek fresh air even in these tottering structures.

We hope soon to see a reaction in this locality, and that certain restrictions in leases may be removed, which will have the effect of substituting comfortable, substantial dwellings for dilapidated tenements, perhaps coeval, for aught we know, with Brian Boroihme, whose history is identified with this place, but certainly not offering any features of interest to the antiquarian or archæologist. A little is being done, but not a tithe of what might be, and we gladly notice that Sir John Bradstreet has built a mansion near the intersection of "the green lanes"—Mr. Carson, architect; as also Mr. Tisdall, in same neighbourhood; likewise that Mr. F. Byrne is about building four houses in Castle-avenue—Messrs. Isaac and William Farrell, architects. Amongst the first and most desirable improvement to be effected is the reclamation of the waste space between Annesley and Ballybough bridges. Surely it might be turned to some better account, if thoroughly drained and neatly enclosed; but at present it is palpably objectionable, both to the optical and nasal organs. We, like many others, had hoped that the abolition of the old turnpike would have effected a perfect revolution; but it has resulted otherwise.

ROYAL DUBLIN SOCIETY.

A scientific meeting of the Royal Dublin Society was held on Friday evening, June 24th.

Communications—1. Dr. Carte on a new portion of the bony covering of a species of Glyptoden, presented to the museum by W. R. Wilde, Esq , M.R.I.A. 2. Edward Brennan, Esq.—Notice of the discovery of extinct elephant and other animal remains occurring under limestone at Shandon, near Dungarvan. 3. Dr. Carte on the identification of the bones discovered by Mr. Brennan. 4. Dr. Kinahan on the laws which regulate the distribution of species in space and time.

AGRICULTURAL SECTION.

Communications—1. Robert Galloway, Esq., on the valuation of soils. 2. Dr. Edward Haughton on some consequences which would result from the adoption of Liebig's theory of the application of the sewerage of towns as manures. The author maintained that guano was inferior to sewage in fertilizing power, and in the extent to which it was obtainable, the cost of the latter manure being now nearly double its original price. Further, that could an efficient system of collecting the former waste substances be carried out, there is no doubt that it would render us quite independent of the supply of guano, and the health of the public would be greatly promoted. Ireland might also increase the quantity of land under tillage, in place of allowing so many thousand acres to be either devoted to rearing live stock, or totally unemployed. The advantages expected from the new system are: 1, larger crops; 2, greater immunity from pestilence; and 3, the purification of all our rivers and seacoasts. These advantages are worth striving for, although the subject may not be a very attractive one, except to the practical agriculturist or sanitary reformer.

THE ENTITY OF THE IONIC ORDER.[*]

BY S. HUGGINS.

AMONG the most remarkable achievements of the genius of form in the ages that are past is the Ionic order; I refer more particularly to its characteristic feature, the voluted capital. By whom it was invented, if individual inventor it had, or by what fortunate circumstance it was first hinted to the architect, it boots us little to inquire; though there is sufficient of the scroll form in nature to lead us to attribute it to her direct suggestion, it is perhaps more reasonable to consider the volute of the Ionians as the joint and gradual offspring of geometrical skill and art genius—as a creation of science refined and applied by art. The volute, afterwards so finely developed by the Greeks, not only in the Ionic capital, but as the main charm of the Corinthian, was in requisition at a very early period of art, into which it seems to have grown imperceptibly from the human mind like a plant out of the earth. It was in some way used in Nineveh, in Egypt, in India; and, in its classic adaptions, was clung to and retained by the Arabians and other Oriental nations, as well as by every people of modern Europe down to this day; and thus furnished evidence of an instinctive affection for it—of the existence of a chord in the human heart to which such forms appeal. Its noblest development, however, and the perfection of application, it received on the banks of the Ilissus, and in the triple temple of the Acropolis, where it assumes a form on which a hundred generations of men have gazed with pleasing wonder, and one wherein all whose hearts could thrill to beauty have recognised a natural grace and genuine artistic feeling. I refer to these examples, because they may be looked upon as the beau ideal of the order, by which, as the nearest approximation to perfection of form, its æsthetic value should be judged, and not by any degenerate example of subsequent times; for, strange to say, no form has, in succeeding specimens of it, more degenerated than the voluted capital of the second Greek order. In nothing did the Roman and Renaissance architects show their inferiority of taste to the Greeks than in the non-appreciation of these forms, shown by their mean treatment and diminution of the volute, and the singular omission of the festoon-shaped hem in their Ionic works; between their insipid and lifeless volute (a small curl at each end of a straight fillet, so small sometimes as to seem a mere accident,) and the flowing and graceful curves of the Erectheum, the distance in artistic rank—in evidence of taste and imaginative power—is, indeed, infinite.

Those who suspect anything meretricious in conception of the Ionic capital should be reminded that it was the chief, and sometimes the sole, ornament of the fairest gems of Attic taste; the temples in which it was employed being amongst the most beautiful in composition and design of that remarkable people, whose profound æsthetic science has engaged the research of ages, and works which have been extolled for their surpassing loveliness by the uniform voices of succeeding times. The Ionic was chosen for the great Temple of Diana, at Ephesus, and the sumptuous tomb of Mausolus and other celebrated monuments of Asia Minor were of the same order. It was a favourite of Palladio, Inigo Jones, and others, acknowledged the greatest among modern masters; and by them and their successors down to the present day it has been extensively used, as it would probably have been yet more but for the supposed necessity for Corinthian richness and luxuriance, or rather, display of costliness on important works, to which too many eminent men have succumbed.

The Ionic is unable to vie with the luxuriance of nature, like the Corinthian; and it is inferior in expression of columnar purpose, *i.e.* capability of support, to the Doric; but it has artistic qualities that amply redeem these shortcomings; it is the most harmonious link between shaft and architrave that could be conceived—the circular line of shaft differently applied, and a most homogeneous termination to a cylindrical form. There is something naturally pleasing in a curve of ever-varying motion, wherever seen, or however relatively situated, whether in the capital, the console, or the modillion; but in the capitals that grace the Erectheum we have an assemblage of curves that, from whatever point viewed, is altogether unique, and which for harmony has perhaps never been equalled. The delightful combination of unity and variety in the geometrical or logarithmic spiral if its volutes, diversity of curvature and increment, regulated by unity of law, joined to the motion and play of curves generally, constitute a total of linear and formal grace that no unprejudiced eye can behold without at least a pleasing interest. Like its eldest sister, the Ionic disdains "the foreign aid of ornament;" in other words, it is independent of all imitation of natural organization, whether of leaf or flower, and trusts to the beauty that is born of pure form; and as a harmony of form only, its capital is more purely a creation, and therefore a greater triumph of art-power than that of the Corinthian itself. Than this feature, indeed, there is, perhaps, nothing more interesting to the cultivated eye in the whole range of architecture. There is motion and flow of lines,—but motion so gentle and flow so peaceful, or ordered and regulated by such beautiful and serene law, as to combine the graces of action with the softness of repose. Qualities these, by the way, which render it a happy metaphor in the architectural poem it illustrates, and gives it a high value as a material exponent or type of certain moral perfections. While the Corinthian belongs to the passions and the senses, the Ionic may be said to express their silence, and shadow forth the tranquillity of Contemplation and Philosophy; and this suggests its suitablenes as a feature of colleges and educational establishments, as well as in public libraries. It was the sepulchral order of the Ionians; and, as Le Clerk observes, is suitable for all places dedicated to peace and tranquillity; an opinion evidently coincident with that of the ancients, who significantly applied it in the Temple of Concord, as they did also in shrines consecrated to females; and among the Egyptians it is remarkable that traces of it are particularly observable in those temples dedicated to Isis. But the Ionic expresses another important quality, viz. purity; it is the very soul of chasteness, and is to the Corinthian (adapting Sir Henry Wotton's simile,) as the sedate matron to the courtezan.

Some have supposed the Ionic capital to be a representation of elasticity, and as such have charged it with being obscure and inconsistent in constructive meaning; but I do not believe its inventors would have made so great a mistake as the attempt to express in stone a quality which it is adverse to the nature of stone to exhibit. I believe it was not intended to have any constructive meaning—that the volutes were merely a beautiful accessory, and that the abacus, which was always distinctly marked, and had a natural and obvious use, was the real capital of utility. The Greeks probably wished the Ionic to be a relief from the strong energetic expression of the Doric, and aimed, in its design, at abstract beauty of form,—a meekly aspiring nobleness and purity.

It is true that the want of facial uniformity in the Ionic capital subjects its application to some limitation; it being compulsory on the architect either to avoid using it in situations, as in prostyle porticoes, where a returning face is required, or to make the capital of the angular column an artistic monstrosity, by turning one of its volutes diagonally, and bringing two voluted faces into conjunction. But the condition of using the Ionic order only in situations requiring no returning face, may be very cheerfully submitted to, as, fortunately, such situations are tolerably frequent; for, besides monoprostyle porticoes, it is applicable to cyrto-style, or semicircular porticoes; to cyclostylar compositions, or circular peristyles generally; and to porticoes in antis, or recessed loggias, which latter suggest the expediency of introducing square pilasters, with anta-caps, in lieu of columns, to the angles of prostyle porticoes exceeding one inter-column in projection from the building.

The difficulty in question is solved in interiors by the possibility of always in such situations resorting, with strict propriety, to the antæ accompaniment. To interiors the Ionic order is particularly adapted; and there it was frequently used by the ancients in Doric structures. Moreover, it must be granted that the European Greeks acted with their usual wisdom in restricting, as they did, the employment of the Ionic order to their small edifices, a gem-like brilliancy and elegance of line being its most striking attribute.

And this recession of the Ionic column between antæ, in enclosed loggias or propylean entrances, while it supersedes the necessity for generating the mutilated form that disfigures the Temple of Fortuna Virilis, gives new beauties to the order, beauties it could not otherwise receive; to such treatment it seems peculiarly adapted; the dissimilarity between its front and side faces pointing to that situation as its fitting and legitimate home, wherein it receives a heightened effect by the contrast with the antæ-caps, the rectilinear plainness of which communicates to the volutes a more brilliant and gem-like glow than they could otherwise exhibit. In fact, the beauty of the Ionic capital is but half revealed till thus brought into harmonious contrast with the antæ caps, which should, therefore, be employed to all pilasters placed in connection with Ionic columns, whose effect they enhance, while they secure to the composition generally the fullest variety of intonation.

The one-horned capital, though not without its advocates among judicious writers, is, it cannot be denied, an artistic abortion that must ever be painful to the eye of taste; but there is no necessity for its existence in the world of art, nor even, in order to avoid it, for the injurious modification of a design, or abandonment of any necessary arrangement or felicitous idea in respect of plan, the Ionic not being the sole order of architecture.

I have all along, in treating of the Ionic order, regarded its capital as consisting of the two voluted and parallel faces with baluster returns, which make up the celebrated Greek examples. I do so, not that I consider this form as alone defensible; I regard the Scammozian and other four-faced Ionics as valuable inventions possessing a species of beauty; but these being more closely allied to the Corinthian and to the class called Composite than to the Erectheum and Ilissus Ionic, in which the dissimilarity of front and side is the chief and distinguishing characteristic, I consider the advocate of Ionicism has little or nothing to do with them. I think it important that this distinction should be made; for, though the uniform capitals are beautiful as varieties, especially the concave-sided example of the inner order of the temple of Apollo at Bassæ, which has a classic chasteness and simplicity that the others so much lack, and useful in meeting the angular difficulty before referred to, yet in them you cannot have that full development of the volute, nor that general simplicity and placid grandeur—that unaffected dignity and grace which gives the surpassing beauty and expressional value to the Athenian examples. Besides, it is to this facial diversity, as the trait most divergent from the other orders, it is mainly indebted for its place as a distinct order.

---

[*] Read before, and published in Transactions of Liverpool Architectural and Archæological Society.

My first object in this essay is the vindication of the right of the Ionic to rank among the orders of architecture. I have pleaded only its beauty; but he who lifts any corner of the veil of mistrust from its beauty proportionally forwards this aim, since

> "Beauty is its own excuse for being."

I say to rank among the orders; but it really matters not whether we regard Ionicism as inhering on a distinct order, style, or system, or as merely forming a variety of an order or system. That what we call the Ionic order is beautiful architecture, or a beautiful element of architecture, is all we need in reality to prove. Perhaps, strictly speaking, there is but one real order,[*] and the rest are variations in proportions of height to diameter, in which graceful ornaments in the shape of volutes or foliage, or both, are added to the forms of necessity. If so, the Grecian Doric, whose general form is that dictated by utility, the form with which an engineer would prop a warehouse or support a railway bridge, is the column or order in its nude essential grandeur, or, if conceived of as dressed, in its working dress; and the other two are its more elegant æsthetic offspring, the Corinthian capital being only an elongation and foliation of the Doric echinus,—the Ionic its conversion into the convolutions of the volute; while the abacus, the Doric form of which is too essential to all columns to admit of much modification, is preserved in both. Perhaps the Ionians had no idea of inventing a new order, or supposed they had done more than reproduced the old one in a gayer dress.

But supposing this to be the true theory, and that what we call orders are to be regarded only as variations—not genera, but species, they are not less valuable, and we can suffer none to be extinguished that are really beautiful, though increase among the varieties of the orders may be had beyond three or five or any number or degree now dreamt of. Premiums have been offered for a new order, as if that were the great desideratum; but a man may open a fresh vein in British architecture, and strike a new chord in the human heart by the combined beauty and originality of his conceptions, without inventing what is generally understood by a new order. Besides producing new and original general designs and compositions, he may be constantly delighting the world with new varieties of capitals and other features of his ordinance; his mind, like the vital principle in nature, may be constantly and everywhere breaking out into new forms, and need not run into old channels. But so far as capital is concerned, many distinct varieties have been already introduced: the Gothic and Byzantine builders invented a host of them, many of which are very beautiful. This inventiveness of the Gothic builders, and which we must regret had not to a greater extent characterized the Renaissance architects, we may, in recovering lost ground for the art in the first place, avail ourselves of, by taking possession of their inventions; for I believe that much of the variety, and beauty, and life we admire in the Lombardic and Byzantine capitals, and that attached to those of the Gothic, might have been retained in classic architecture. I have frequently been charmed with the classic chasteness of many of these capitals, the immense variety of which show the vitality and plasticity of the architecture of the ancients, and what it might and would have been, had the same singleness of aim, enthusiasm, and natural freedom of mind been applied to it. Few of them are essentially or exclusively Gothic; in many the classic chasteness of character is scarcely touched; and so little is the departure from antique purity of form, that they might be adopted at once into the Greek and Roman families; and if, instead of labouring at the production of a new order on the one hand, or reducing what we have to stereotyped formulæ on the other, our architects had been employed in seeking hints for varieties from existing works in other styles—in ungothicizing Gothic, and bringing back Romanesque to its original simplicity, much better would have been the result. The very worst of these may at least touch the imprisoned springs of inventive power, and furnish the imagination of the designer, who would scorn no source for motives of thought, with materials for new images. But the architect who is a true magician of the beautiful, would take a still wider range in search of inspiration: he would evoke new orders from among the "dark red colonnades of the Nile," and even avail himself of the fanciful vigour of Indians and other Orientals, however wayward in feeling, or humble in artistic skill, till every ancient and modern style contributed something of grace or of energy to the visions of beauty he would eternize in stone. In Egyptian remains, which present infinite variety of capitals, many of them elegant in design and rich in decoration, is a grand suggestive source, in which sleep the germs of many beautiful classic varieties. It has often forcibly struck me how slight the modification that would render some Egyptian capitals beautiful classic ones, worthy and fit associates of the chastest Greek or Roman examples: there are some foliaged capitals so beautiful in their composition, that by only changing the character of the leaves, would harmonize with those of the Lysicrates monument itself; and with respect to many another, simplify—slightly rectify its proportions—suppress some overgrown member, and what classic beauty would stand revealed?—beauty that but for the stern symbolism of their overlaying superstitions, its designers never could have missed as they did. If in this spirit the Greco-Romano architecture had been practised,—if in its pursuit we had yielded to our instincts, which have been resisted in architecture more than in any other human pursuit, we should have had no complaints of architecture being behind the age—a laggard in the march of intellect. By the dictum of Wren, which has not been taken with sufficient qualification and reserve, that the pursuit of architecture is now rather the study of classic antiquity than the exercise of fancy, classic antiquity has been somewhat slandered: the three orders are not to be considered as patterns, mere stereotyped formulæ, or ready made members to be incorporated in our designs, as the Constantinal builders used the executed columns and other fragments in their erections. Their use is to inspire: the best of them are but so many methods from which we may learn much by analogy; from which by imitating different of their qualities according to the idea to be expressed, new designs may be engendered. There is no model for each order. I view the orders not as forms of definite shape, but as spirits of design, which by transmigration, as it were, into a thousand different bodies, hereafter to be organised by art, becomes incentives of thought and emotion to the latest times.

We talk of established forms, but many forms we have regarded as such are not established, nor were ever intended to be established. They are simply designs—illustrations of art—and we are to look upon them only as individual impressions, interpretations, and utterings of the truths of nature. So that the practice of literally copying the Parthenon Doric or Jupiter Stator Corinthian even into compositions otherwise original is not a necessity caused by any limitation in the architecture itself, but is simply an exhibition of dulness or idleness on the part of the architect, for which the practice of the ancients furnishes no precedent; for all their buildings are dissimilar, no two being alike either in proportions or details. The immense variety of capitals and other members found among their edifices, ruins, and preserved fragments, shows that they did not consider any preceding examples in the light of patterns, but that, by throwing themselves on their own mental resources, they were enabled to make new designs for every building they erected; designs in the full sense of the word new, in which no lifeless parts had place, but where all, to the smallest detail, glowed with the pure light of thought. If this was once done, it can be done now, and we may follow the ancients as they followed each other, and breathe into the elements they have left us a second life of truth and beauty.

THE DWELLINGS OF IRISH LABOURERS.

Under the title of "*Reasons for extending the Land Improvement Act to improve the Irish Labourers' Dwellings*," Mr. W. J. Levinge, of the county of Westmeath, has published a very useful and interesting pamphlet, which we would gladly see in the hands of every member of the legislature. We must not attempt to give within the compass of a notice a just estimate of the arguments used by Mr. Levinge for extending the operation of the law. The object of the pamphlet is, however, so clearly expressed in the title that there is no necessity for an analysis. The law at present provides for the good and comfortable accommodation of cattle, by enabling owners and occupiers to raise money for the erection of farm buildings. Mr. Levinge thinks the same care might with advantage be extended to the housing of the people and the improved physical condition of the labourer; and the improved moral and intellectual conditions of their families would more than compensate owners for the risk, while the additional rent paid for the better cottages would, in fact, pay all the cost within a very short time. The subject is one of importance, and we are glad to see Mr. Levinge apply himself to it with such zeal.—*Freeman.*

---

[*] Mr. Ruskin tells us that all capitals might be divided into concave and convex, and thus arranged into *two* orders. It is true that their constituent curves could be so divided; but if from the collected capitals of the world we were to separate the convex, would not other than concave ones remain—a kind more beautiful than either, viz. the ogee? This figure many of the Egyptian capitals are in actual or general contour.—S. H.

TELEGRAPHIC PROGRESS—OVER-HOUSE WIRES.

It may safely be predicted that the electro-telegraphic system will yet be rendered available for many useful purposes, at present hardly thought of. The powers of this marvellous agent cannot fail of further development. Time and space, two of the great difficulties which man is always attempting to conquer, are brought under control, by electric means, to a greater extent than by any other natural agent available for practical use; and it will be our own fault if we do not apply still further the bounteous gift placed at our disposal.

These minor applications of electric power may be classed into *time-balls, electric clocks*, and *local telegraphs.*

A time-ball, such as that which Professor Airy caused to be constructed at Greenwich, is not merely a clock of wonderful accuracy; it is practically a monster clock, whose indications are visible from a very great distance. True, it tells its tale only once a day, and is used chiefly as a regulator of clocks and watches, chronometers and time-pieces elsewhere; but at this particular hour its accuracy transcends that of all ordinary clocks; while its indications are visible from a distance far greater even than those of the clock at the New Houses of Parliament. The Greenwich time-ball is so generally known, that a few words of description will suffice. On the top of the observatory is a large, hollow, coloured ball, which slides up and down a pole passing through its centre. Mechanical apparatus effects all the usual movements of the ball; but electrical contrivances cause the descent of the ball exactly at one o'clock every day. The astronomical clock belonging to the observatory, one of the most perfect ever constructed, gives a click or movement to a particular piece of mechanism, at that particular moment; and the movement is communicated through an electric wire to the ball, or rather to a lever which retains the ball in its place; this lever being affected, the ball falls through a distance of many feet. Now, the movement of a spherical body, standing out in bold projection against the sky, can be seen from a very considerable distance. Captains of ships passing down the Thames can see the descent of this ball (if at one o'clock in the day), and can regulate their chronometers by this signal.

When once the usefulness of the Greenwich time-ball became apparent, an extension of the same system was naturally to be expected. The Electric Telegraph Company erected a time ball on the summit of their establishment in the Strand. At the very instant when the Greenwich time-ball falls, an electric current is sent through a wire from the observatory to the Strand—which wire passes under roads and streets, and over the Thames; the time of transmission is shorter than human means can measure; for all practical purposes, the two balls descend at the same instant, although the source of power is close to the one, and several miles distant from the other. An example of great public spirit was given by a London tradesman, as a means of serving his neighbours. Mr. French, the chronometer-maker of Cornhill, erected a time-ball at the top of his premises. The ball is visible from many parts of the river, for it stands at a height of a hundred and fifty feet above the mean water-level; and it can also easily be seen from many of the streets in the city. The ball is made of zinc, and is five feet and a-half in diameter. In Edinburgh, on the top of Nelson's Monument, and in Glasgow, on the tower of the Sailors' Home, there are time-balls under precisely similar arrangements, for the use of the shipping in those ports. There is another belonging to the Admiralty at Deal; and one at Liverpool belonging to the Electric Telegraph Company; and we may reasonably anticipate that most of our great seaports will, one by one, avail themselves of this admirable contrivance; for the expense is a mere trifle compared with the amount of service rendered. Of course, so far as the principle is concerned, the ball might be made to fall at any other hour instead of one o'clock, or might do so on many different hours of the day—this is a mere matter of practical convenience.

Concerning *electric clocks*, many persons imagine that there is electrical mechanism within each clock, which "goes" independently of all other clocks; such, however, is not the case. An electrical clock is little more than a skeleton; its interior mechanism is small in quantity, and not very complex. The face (illuminated at night), the figures on the face, and the hands that travel round from figure to figure, are the chief components. There is a central clock (say at Greenwich) which gives the right time, and electric wires convey impulses from this clock to the electric clocks, wherever and how many soever they may be; there is mechanism which causes this impulse to be given to the hands. Theoretically, the number of clocks thus set going from one centre might be almost unlimited; it is simply a question of practical convenience. In front of the Electric Telegraph Company's Office in the Strand is an electric clock for the use of the public; while within that and other offices of the same company, clocks of analogous action are very numerous. Most of the railway companies have facilities for correcting their station-clocks by electric agency. Time signals are sent hour by hour from Greenwich, and are transmitted through the Electric Company's wires to various stations and towns in the United Kingdom—an achievement truly wonderful, were it not that we have almost ceased to wonder at such things.

Let us now proceed to the subject of *local telegraphs*—those which do not travel to great distances.

It needs hardly a word of explanation to show that a copper wire, connected with the proper electric apparatus, might convey a signal from room to room, as well as from city to city. Some of the monster hotels of America have already adopted the system; and it is, we believe, adopted in the Houses of Parliament, to ring all the bells in the several committee rooms at four o'clock, to denote that "the speaker is at prayers," and that the committees must close their labours for the day. Few manufacturing establishments are large enough to render such a contrivance necessary, seeing that a gutta-percha speaking-tube suffices; yet there are breweries which cover several acres each, and a few other large establishments fitted to profit by an electric telegraph. One London firm, however, Messrs. Waterlow, have adopted the system under a singular form. They have formed a *house-top* telegraph between two factories situated in different parts of the metropolis. Having obtained permission so to do, they arranged their posts on certain house-tops, stretched their wires high up across the streets, and established the requisite galvanic or magnetic batteries at the two terminal stations. Of course, in an arrangement of this kind, nothing can be done except with the consent—either by kindness or by purchase—of the owners of the houses thus so singularly over-topped.

The "over-house" telegraph system has been adopted in Paris, Brussels, and New York, for local purposes; and the success of those attempts, coupled with that of Messrs. Waterlow, has suggested the establishment of a company for applying the system on a very large scale in the metropolis. Without offering any opinion on the speculation, in a Stock Exchange point of view, we may briefly notice it in its topographical and mechanical features.

The proposal embraces, in the first instance, the means of electric communication between any place, within a radius of four miles from Charing Cross—an extension of the radius being easily practicable afterwards, if success should attend the opening enterprise. Within this circle of four miles' radius, or eight miles' diameter, the metropolis has been hypothetically divided into eleven districts, each containing, on an average, nine stations, or about a hundred stations in all. The stations are so selected as to locality, that the delivery of a message may be made within a few minutes after its receipt. In a map, lithographed to illustrate the intentions of the projectors, about a hundred stations are marked down. One, a great central station, is near that great centre of the world's commerce—the Bank of England; ten others are district stations, each the principal station in a particular district; while all the rest are local stations, subordinate to the chief ones in the respective districts. All the local stations are to be connected with the chief stations of the same districts; and all the district stations are to be directly connected by the nearest practicable routes; but wires will only be laid down from one minor station to another, according as they form parts of a main route.

Wherever practicable, it is proposed that the wires should be stretched up aloft on the "over house" method. This would be preferred, on the score of cheapness in the erection, of facility in the repairs of injuries, and of the avoidance of interruption to public streets by any underground arrangements. To what extent, however, such a plan would be practically avoidable, is one of many problems which would have to be solved. Two or three existing companies have telegraphic wires underlying the streets of the metropolis; and these might, possibly, under amicable arrangements, be made in part available for the local telegraph.

Now, as to the kinds and varieties of purposes for which this metropolitan net-work would be serviceable. The scheme of the projectors may possibly not be altogether reliable, as to the sources and amount of profit; but it will, at any rate, serve to indicate the views entertained as to the requirements of the public. The one hundred stations, and the many scores of miles of wire, would, it is estimated, contribute to the following end:—To convey government messages, military and civil, in connection with all public offices; to summon witnesses in the country to the law-courts in London, and to facilitate the proceedings of barristers and solicitors in relation to those courts; to convey messages and announcements pertaining to the important events of births, marriages, and deaths, of which there are no fewer than 160,000 annually in the metropolis; to summon medical practitioners at times and places where there is pressing need; to give notice to the several firebrigade stations of the breaking out of a fire; to aid the police authorities in the various matters where promptness in police duties is important; to announce departure from, or arrival at, any of the metropolitan railway stations, on the thousand-and-one commercial and domestic matters which now so much affect men in this travelling age; to ascertain, before making a visit of business or pleasure, whether the person to be visited is "at home;" to make or postpone appointments for meeting;

to maintain communications between the business-houses and the suburban residences of "city men;" to arrange with the existing telegraph companies for the collection of such of their messages as start from different parts of London, and for the delivery of such as are directed to London, in such manner that the general and the local telegraphs may mutually assist each other; to provide wires and instruments, which may extend from any one of the company's stations to any establishment belonging to government-offices, police-offices, fire-brigade stations, carriers, manufacturers, wholesale dealers, wharfingers, dock and canal companies, railway companies, bankers, hotel-keepers, &c.; such wires to be used solely by and for the particular establishment paying for the accommodation.

The commercial question, as one of profit and loss, we have already decided not to notice here. We stop not to inquire whether they could send 10,000 messages a day from the central office alone? whether they could fit up all the stations, and provide all the wires and apparatus, for so low a sum as £35,000? whether we might or might not reasonably expect that one person in each family would use the telegraph, on an average, once in three months? whether the three million of souls in the metropolis would, even at this low average, bring £40,000 per annum to the company's coffers? whether the system would open a field for useful woman's work, as telegraphic clerks at the various stations?—these are questions to be decided on their own merits, by persons best fitted to estimate them; but we cannot hesitate to express a conviction that a system of local or street telegraphs, whether "over-house" or otherwise, are among the things which we are destined to see ere long. But *cheapness* will be an indispensable feature of the plan. to insure success; the penny-post has spoiled us for any forms of transmission—whether of persons, messages, letters, or commodities—which involve the high charges of former days.—*Chambers's Journal.*

Correspondence.

STEAM FIRE ENGINES.

TO THE EDITOR OF THE DUBLIN BUILDER.

Sir,—From a letter dated Boston, 26th May, written by Mr. Wilton, and published in the *Era*, I extract the following:—

"In Cincinnatti I observed a great improvement in the fire department, by the introduction of very ingenious steam fire-engines. There are thirteen in the city, in as many districts. Each has four horses attached, which are kept in constant readiness, and four men. A still greater piece of useful ingenuity is displayed in the fire department telegraph. In every district is a small box, in a wall, containing communicating wires to each engine station, and when a fire breaks out the policeman nearest goes to the telegraph-box, opens it, touches the indicator, which instantaneously informs all the engine stations the locality of the fire; and in two minutes from this the fire is made known, horses in, steam up, and on the road to the spot. The toy engines play their four and six-inch hose, throwing an overwhelming stream, which soon extinguishes the most desperate looking fire; in fact, since the introduction of these such a thing as a great fire is now scarcely known."

Allow me to suggest to the numerous fire-insurance offices in London and Dublin the propriety of calling a meeting to adopt a similar plan to the above. By a moderate contribution from each office two or three small steam fire-engines could be purchased to throw the water in an "*overwhelming stream*," and thus much valuable property would be saved. At present the fire-engines of Dublin are absolutely useless, and do little or no good when a fire takes place. The Lord Mayor and corporation would, I am sure, join in any plan which would be the means of rendering them efficient.—I am, sir, your most obedient servant,

June 20, 1859. George Mason.

OBITUARY NOTICE.

We regret to have to announce the death, after a short illness, of a young and promising member of the architectural profession in Dublin, Charles Owens Carroll, Esq. Mr. Carroll was a pupil of one of our most eminent architects, E. P. Gribbon, Esq. and had but some two years since entered on his own professional career, during which—although so suddenly terminated—he had, from his ability, made much progress, and from his uniform amiable and courteous demeanour acquired a large circle of friends.

Home made Gas.—Lord Cloncurry has determined to light up his beautiful seat, Lyons, Celbridge, with gas made on the premises, and for this purpose has employed Messrs Edmundson and Co., gas engineers, of Capel-street, in this city, to erect one of their gas apparatus.

Notes of New Works.

A monumental oratory is to be built at Glasnevin Cemetery, according to designs by J. J. Lyons, Architect. It will be placed within a planted enclosure, 14 feet by 8 feet, defined by a granite base course, rounded at the angles, and surmounted by a plain iron railing. At one end will be a gateway for admission to enclosure, and for transmitting the remains through a moveable trap to a vaulted chamber underneath; and at the other the oratory will be placed at a distance of two feet within the boundary, and approached from without through a segmental area formed by the junction of the base course with the entrance doorway. The oratory will be circular on plan, 4 feet diameter in clear; fitted internally with a small altar and marble pannelling—having scriptural quotations engraved thereon—round the walls; and lighted from above. Externally, the elevation will be vertical to a height of 7ft. 6in. surrounded by a granite base course 18in. high, and having continuous French rustics, impost and astragal mouldings, and surmounted by semicircular stone dome, terminated by a cross, and perforated at top to receive a flush light of very thick glass. The superstructure of the oratory will be of Scotch stone with brick lining, and plastered internally with Portland cement. The door will be of iron, massive, and perforated, and constructed to open in the centre and slide on iron rollers into the wall. The total height to top of dome, will be 10ft. 6in.

Alterations and additions are to be made to the guard house and cells at the old barracks, Fermoy; new kitchens and water-closets, &c., are to be added to the officers' houses at Newbridge barracks (where a chapel school is at present building); additional hospital accommodation is to be given at Tralee barracks, and a breakwater formed round Magilligan tower at Lough Foyle, all under the Board of Ordnance.

The church of Drumconrath, county Meath, is to be refitted by the Ecclesiastical Commissioners.

The county courthouse at Longford is to be altered and enlarged, and a new entrance formed to county gaol.

Messrs. Turner and Gibson are the contractors for iron roofing, &c. at Kilmainham gaol; Mr. J. M'Curdy, architect.

It is proposed to erect a complete Turkish bath in the Cork Union workhouse.

The committee of the Goldsmith Testimonial have received £600 in subscriptions. We trust that this and the subsequent receipts may be more judiciously applied than in the recent case of a national testimonial.

We notice that the Committee No. 1 of the Dublin Corporation have declined to accept *any* of the contractor's tenders for recently advertised sewerage works in Harrington, Grantham, Heytesbury, Clanbrassil, Lower Sherrard, and Eccles streets, and Belvidere and Grand Canal places, and seek for new tenders, to be sent in this day.

Additions are to be made to the Victoria House. Clonmel (Messrs. M'Swiney and Reidy, proprietors), according to designs by Mr J. S. Butler, architect.

The church of Derryloran, Cookstown, Co. Tyrone, is to be enlarged according to drawings by the architect to Ecclesiastical Commissioners.

Amongst the new works for which tenders are sought by the War Department are: the enlargement of hospital at Beggar's-bush Barracks; the erection of a serjeants' mess-room and kitchen at infantry barracks, Clonmel; the building of a master-gunners' store, shifting room, and boundary wall, &c., at Tara Hill, No. 6 Tower, Dublin Bay south, &c., £c.

A new tower and spire are to be added to the Catholic church, Dunleer, Co. Louth.

Mr. J. Quin, of Upper Stephen-street, is the contractor for the new premises now erecting for Mr. Gatchell in Dawson-street, and noticed in a previous number.

The attention of agriculturists is directed to the extensive range of farm offices just completed at Castlekncck; they enclose a yard 90 x 40 feet, and have been finished in 6 months, under the directions of Mr. Sloane, at a cost of less than 8d. per cubic foot.

Review.

The Carpenters' and Joiners' Assistant. Blackie and Son, Glasgow, and 17, Eustace-street, Dublin.

We would direct the attention of practical men and mechanics to this work which is now publishing in parts 20 in number at 2s. each, and contains a complete course of geometrical instruction necessary for the trade of a carpenter and joiner; and is embellished with some beautiful illustrative engravings. With such publications as this, obtainable at a moderate price, a tradesman has no excuse for not becoming proficient in his handicraft; and those of the present time have a decided advantage over their predecessors who lived in an age of darkness, when they were without precedents to work from, and were entirely thrown on their own ingenuity.

Miscellaneous.

Execution of Sculpture by Machinery.—A very ingenious machine for the execution of sculpture has recently been introduced in an improved form from the Continent. It consists of a large frame, which, though traversed in several directions by lathe bands to give motion to the tools, is so perfectly balanced on a ball and socket joint that it can be moved in any direction with the slightest touch. The *modus operandi* of working it consists in placing the block of marble or stone to be operated on and the model to be copied side by side, a certain distance apart, opposite the frame, from which project two arms, one of which is surmounted by a circular steel drill, and the other by a simple stump of wood. When the machine is set in motion the arm which rests upon the model, in passing over the inequalities of its surface, regulates the position of the steel drill, which, though attached to the same frame, is traversing the block of marble. As the drill clears away the marble with great rapidity, and as it is raised and depressed exactly as its fellow arm is raised and depressed by traversing the irregularities of the statue, it follows that in an incredibly short space of time an exact *fac simile* of it must be produced. There is no art which entails upon its professors so great an amount of manual labour and toil as sculpture does. More than half the time occupied by an artist in the execution of a bust or group is taken up either in directing or executing the reduction of the block of marble into the rough figure, and yet the real work of the artist only commences after this labour has been gone through. Thus to the present imperfect method of performing the rough part of the sculpture may be attributed in a great measure the enormous prices obtained for good statuary. The invention has been looked upon rather coldly by sculptors in England, who regard it as an instrument rather calculated to lower the character and reduce the emoluments of the profession. But it should be remembered that artists can never flourish till art becomes popular. The great cost of producing statuary at the present day entirely prevents there being a popular taste for it. But no one can doubt, if small-sized marble statuettes from the first models could be produced at little greater cost than the Parian figures now so much in vogue, that the public patronage of sculpture would be found such as to be more profitable than the scanty encouragement now accorded to the profession by a few private individuals. A company has been formed to work the invention in England.

Instantaneous Photography.—A few days since, Mr. Skaife delivered a lecture to several gentlemen who are interested in photography on his process of obtaining instantaneous impressions in the camera. After some general observations on the nature of light and on the rapidity of its action, Mr. Skaife proceeded to explain his plan of operating instantaneously, and showed some of its results. Instead of having a cumbersome camera, with a stand to support it, Mr. Skaife's apparatus is so small that it may be carried in the breast pocket. The camera-box is little more than an inch square, and the front of the small lens is covered by a lid to exclude the light. The collodionised glass on which the image is focussed is correspondingly small, and the miniature pictures thus taken are subsequently copied with a larger camera. By thus concentrating the rays on a small field, the intensity of the light produces the effect in a shorter time than with a lens of the ordinary size, taking larger pictures, and the instantaneous uncovering of the lens is sufficient to produce the effect. By this means a photographic sportsman may carry his camera like a pistol in his hand, and on seeing any object either stationary or flying, that he wants to have, he has only to present his pistol at it and pull the trigger, which momentarily opens the lid, and the game is bagged; every hair or leaf of it being depicted in the miniature, which may be afterwards enlarged to one hundred times the size. Among the specimens shown were steamboats in rapid motion, and even bombshells in their flight through the air. The smoke caused by firing a mortar was represented clearly in several photographs, which exhibited what Mr. Skaife calls the "mortar phantom," for in the convolutions of the smoke there were clearly depicted a human face. The constant appearance of a man's face in the smoke of the explosion, Mr. Skaife considers something more than a fortuitous occurrence, and he has given it the name of the "mortar phantom." The features of a human face are, indeed, clearly discernible in the photographs, but they are not alike in the different specimens. Mr. Skaife pointed out several applications of this ready and instantaneous means of taking photographs, one of which is to the determination of the true course of projectiles when fired through the air. Beautiful photographs of large size were exhibited, which had been magnified from miniature images that were placed underneath them.

A breakwater is to be built in Table Bay, Cape of Good Hope, where such a protection has long been needed; and as it will be constructed under the direction of Mr. Coode, the engineer of the Portland Breakwater, mariners may count on seeing a safe harbour created on that southern end of Africa.

Hydraulic Ram.—At the request of the Mercers' Company, the Messrs. Gardner, of Armagh, have recently erected a hydraulic ram at Kilrea, by means of which the town is supplied with spring water. The machine is at a distance of about 700 yards from the village; and the spring—a celebrated one, called Tubberdoney—is 134 feet lower than the point at which the water is delivered. Through this distance (700 yards) and up this elevation (134 feet) twelve gallons of water have been driven every minute during the last fortnight; and by an increased opening of the valve—from three-sixteenths of an inch, as at present, to six-sixteenths, which is possible, as much more could be supplied. The size of the ram, though unusual, if not unprecedented, is not, however, its greatest peculiarity. The driving water and the driven are different in their sources, and more so in their quality, and by modification of the ram, never attempted before, but designed and carried out by Edward Gardner, Esq., are kept separate, while they pass through it. So complete is the separation, that, after the mill-pond, from which the driving power is derived had been used for steeping flax, not the slightest taint of flax water was perceived in that drawn at the various fountains in the different streets of the town. The work was inaugurated on Monday, the 6th ult., by J. R. Dolling, Esq., J.P., the lately-appointed agent of the company, who could scarcely have begun his administration more auspiciously, as all the town was anxiously waiting for a year or more for the opening of the fountains.

Railway Breaks.—The directors of the Lancashire and Yorkshire and of the East Lancashire Railway Companies are bringing to a close a series of experiments with railway breaks, which have been made under the superintendence of Mr. W. Fairbairn, C.E. Mr. Newhall, of the East Lancashire Company, is the inventor of one of these breaks, and Mr. Fay, of the Lancashire and Yorkshire Company, is the inventor of the other. The trials made have taken place upon various parts of the companies' lines, the first series at Oldham on the 4th of February, down a gradient of 1 in 27, and at subsequent intervals near Southport, on a straight and level portion of the line. At the last experiment, made on the 19th instant, near Southport, the trains consisted of three carriages, loaded to weigh nine tons each, making a total of twenty-seven tons, independent of the engine and tender. Upwards of a mile was allowed to the engine-driver to get up speed, and then the train was run over a measured half-mile, marked by fog signals. On the explosion of the fog signal at the end of the half-mile the engine was detached and ran ahead, leaving the trains to be brought up by the breaks. It appears that in one of these trials with Mr. Fay's break, at sixty miles per hour, the train was brought to a stand in 204 yards. Mr. Newhall's break brought up a train running at the speed of sixty-three miles per hour in 278 yards. In a previous trial it was reported that Mr. Newhall had brought up a train at thirty-two miles per hour in fifty-six yards, and that Mr. Fay had brought to stand a train at forty-four miles per hour in ninety-eight yards. At the experiments on the 19th instant a trial was made with the same trains, without the application of the breaks, the engine shooting a-head from Mr. Fay's train after attaining a speed of forty-five miles an hour. With the impetus thus given to it the train ran two miles and three-quarters before stopping. Mr Newhall's train, with the engine detached at a somewhat slower speed, ran nearly three miles and a-half before sopping. One result of these experiments has been to show that stopping the action of the wheels, so as to allow them to slide, or "skid," is less effective than such a pressure only as will break the rapidity of their revolution to the utmost without stopping them altogether. At most of these experiments directors belonging to both companies were present.—*Times.*

Some experiments were lately made on the Eastern Railway of France for lighting the carriages by means of portable gas. It was found that a single supply would suffice for the double journey from Paris to Strasbourg and back.

Limerick and Ennis Railway.—The remaining portion of this line from Clare to Ennis, including the bridge across the Fergus, has been examined, and approved of by the government inspector.

Heights of Water Troughs.—Water-troughs for horses should always be countersunk in the earth or stable floor, on a level with the horse's feet. The natural mode of an animal's drinking is on a level with the stream; anatomists will agree that the throat of a horse is so formed, that this position is necessary in order that the water should lave those parts of the throat which particularly need such refreshment. It may be urged that it is more convenient for a horse in harness to have the water brought up to him, instead of his having to lower his head to the water; but such is not the case. When the bearing rein (that painful relic of barbarism) is unloosed, a horse has no difficulty in putting his head to the ground; witness horses taking their bait as a proof, and the heat and pressure of the collar in drawing render the thorough washing and cooling of the throat more than ever acceptable. Besides the benefit conferred on horses and cattle by cutting down the cisterns to a reasonable proportion, they would be made available for the lesser animals.

The Viceroy of Egypt has ordered that henceforth the historical monuments which exist in Egypt shall be preserved, and that a museum shall be established for the reception of the moveable antiquities which may be discovered. Already has the clearing away of the rubbish which surrounds certain monuments commenced, and amongst those monuments is a temple at Edfou. As to the museum, M. Mariatte proposes to establish it in a large temple discovered by himself in the vicinity of the great pyramid.

Air and Ventilation.—There is always a draught through key-boles and window crevices, because the external air being colder than the air in the room we occupy, rushes through the window crevices to supply the deficiency caused by the escape of warm air up the chimney. If you open the lower sash of a window, there is more draft than if you open the upper sash. The reason of this is because if the lower sash be open, cold air will rush into the room and cause a great draft inward; but if the upper sash be open the heated air of the room will rush out, and of course there will be less draft inward. A room is best ventilated by opening the upper sash, because the hot vitiated air, which always ascends towards the ceiling, can escape more easily. The hottest place in a church or chapel is the gallery, because the heated air of a building ascends, and all the cold air which can enter through the doors and windows keeps to the floor till it has become heated.

To Correspondents.

J. M'G., Crossmolina (The depth and thickness must necessarily vary according to the dimensions of the window, but those you gave are unprecedented for *any* open, if your query be rightly placed before us. It may be a splayed *jamb* or *pier* between double or triplet lancet lights; not a "mullion" in a single open, if so, the case would be different, and the stated proportion not be inconsistent); L. F., Halifax (Direct from the office, per post); Subscriber (We best consult the general interest by scrupulously adhering to our professed principles, however a solitary individual may consider himself disregarded); Architectural Student (If suitable); W. B., Skerries (Thanks for suggestion, but one day too late to provide requisite space).

NOTICE.

Orders for Subscriptions to, and Advertisements for, The Dublin Builder, *will be received at the Proprietors' Office,* 17, Lower Gardiner-street. *Wholesale Agents*—Messrs. W. H. Smith & Son, *Sackville-street (from whom* "The Dublin Builder" *may be had at every Railway Station), and* George Mason, 24, *D'Olier-street.*

Payments (by Post-office Order or otherwise) for Advertisements in this Journal are to be made to PETER ROE, at the Printing Office. 42, Mabbot-street, Dublin.

Published in London by Atchley & Co., 106, *Great Russell-street, Bedford-square; and to be had in Belfast from* Mr. Henderson, *Castle-place.*

ENLARGEMENT OF "THE DUBLIN BUILDER,"

OR

Irish Architectural, Engineering and Mechanics' Journal,

PUBLISHED ON THE FIRST OF EVERY MONTH.

ESTABLISHED JANUARY 1, 1859.

The Proprietor of "The Dublin Builder," yielding to the request of many of his valued supporters, and grateful for the unprecedented amount of patronage extended to his Periodical, even in its infancy, has increased the size from

SIXTEEN to TWENTY-FOUR pages, WITHOUT EXTRA CHARGE.

By this means he will be enabled to devote a larger space than heretofore to Advertisements, as well as to Reading Matter, and to secure insertion, without fail, for several favours hitherto unavoidably omitted, in consequence of limited Advertisement space.

The attention of English, Scotch and Irish Manufacturers, Machinists, Civil and Mechanical Engineers, Patentees of Inventions applicable to Architectural, Engineering, Building and Sanitary Purposes, &c., &c., is earnestly directed to

"THE DUBLIN BUILDER,"

AS A MOST DESIRABLE ADVERTISING MEDIUM,

Commanding as it does instantaneously and extensively throughout the United Kingdom, but Ireland especially, the numerous classes for whom such Advertisements are intended.

RATES FOR ADVERTISING:—

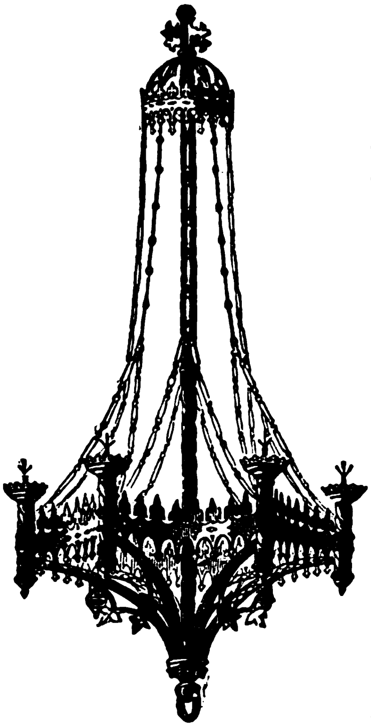
Sixpence each for first three lines, and Threepence for each succeeding line—large type counted double. Double and treble column Advertisements charged proportionately. Discount, varying from 5 to 15 per cent, allowed, according to the length of order.

Accounts furnished Quarterly, unless otherwise specially arranged.

N.B.—APPROVED WOOD BLOCKS OR STEREOTYPES INSERTED.

Yearly Subscription, 3s.; per post, 4s. (payable in advance).

Communications addressed to the Proprietor and Editor, Mr. John J. Lyons, Architect,
17, LOWER GARDINER-STREET, DUBLIN,
Shall receive immediate attention.



JOHNSTON, BROTHERS,

CLARK AND CO, ORIGINAL INVENTORS AND PATENTEES OF REVOLVING SHUTTERS.

CLARK'S NEW PATENT SELF-COILING REVOLVING SHUTTER, FOR SHOP FRONTS AND PRIVATE HOUSES, AT **2s. 6d. PER FOOT.**

MESSRS. CLARK and CO., of 15, GATE-STREET, LINCOLN'S-INN FIELDS, have recently introduced a New Self-coiling Revolving Shutter, for which they have obtained Royal Letters Patent, which, in addition to being one-half the expense, has the advantage of being remarkably simple, and, consequently, less liable to get out of order. All the complicated gearing apparatus is dispensed with: there are neither wheels, shafts, rollers, cords, nor weights, to become deranged.

We are disposed to think they will be largely used, both for shop-fronts and private houses. Much of the difficulty now often found in providing shutters for large bow-windows may be obviated by their use, without extra cost.—*From the "Builder," June 26th*, 1858.

PROSPECTUSES, WITH FULL-SIZED SECTIONS, SENT POST-FREE, WITH NUMEROUS TESTIMONIALS.

CLARK AND CO., ENGINEERS, 15, GATE-STREET, LINCOLN'S-INN FIELDS, LONDON.

W. WARNE AND CO.

CALL the attention of Engineers and others to their PATENT MINERALIZED and VULCANIZED INDIA-RUBBER, in Sheets, and for Valves, Washers, Railway Buffers, Bearing Springs; Hose Pipes (delivery and suction), Flexible Tubings, Driving Belts, and to their improved Anglo-American FLEXIBLE CANVAS and INDIA-RUBBER PACKING, for Steam Joints and Piston Rods.

SOLE MANUFACTURERS OF THE
NEW PATENT MINERALIZED KAMPTULICON,
AND OF THE
MINERALIZED INDIA-RUBBER SOUNDLESS CARPET CLOTH,

Combining EXTREME FLEXIBILITY, and consequent non-liability to cracking; DURABILITY and IMPERMEABILITY to Wet; WARMTH TO THE FEET AND SOFTNESS TO THE TREAD.

SOLE MANUFACTURERS OF
WARNE'S NEW PATENT INDIA-RUBBER MATS.

These Mats consist of Tubes of India-Rubber, of various configurations, placed vertically in contact with each other, and are far more efficient than any other description of Mat. No ordinary wear can sensibly affect them; they thoroughly clean the feet like a brush, and the dirt removed falling through the cells formed by the tubes, is not carried by the feet on to the floors and passages, which are consequently kept perfectly clean; and by removing the Mat, the accumulated dirt is easily swept away. They are also made with backs.

The Mats never clog, require no beating, and are readily cleansed by water. Unlike all other Mats, water in no way injures them, and it neither lodges on or is absorbed by them. Indestructible by damp or wet, these Mats, made to any shape, size, or thickness, are especially suitable for uncovered passages and out-of-door purposes.

The invention is peculiarly applicable for Mats for Baths, Conservatories, Laundries, Sculleries, Ships, Steamers, Omnibusses, Carriages, and Seats, also for Churches, &c.; and for Scrubbing Brushes for Decks, and Wooden and Stone Floors, and for Housemaids' Mats.

All Mats are marked W. WARNE and CO., Patentees, London. Orders received at the London Warehouse, 9, GRESHAM-STREET WEST, E.C.; or at the Factory, TOTTENHAM, N, MIDDLESEX.

The Dublin Builder.

Vol. I.—No. 8.

PARTY WALLS.—CONTRACTORS' LIABILITIES.

TWO cases of uncommon interest, and involving points of considerable importance in the general practice of a builder's business, have been recently brought in a prominent manner before public notice in this country. One especially, in our own city, the issue of which remains yet to be told,—and whatever our private opinions may be, we must not, in its present stage, prejudge,—but which, considering the pecuniary considerations involved, is by far the more important of the two, and will establish, when decided, a serious precedent on similar future occasions. The other in which, though we may feel less locally interested, nevertheless in principle is equally important, and the verdict of the jury must be regarded as so far settling the question of a contractor's personal liability, while acting even on behalf of others.

The particulars of the latter, which came before Baron Hughes and a special jury, at the late assizes at Enniskillen, are briefly as follows:—A Mr. Collum, solicitor, the proprietor of two houses, erected some forty years ago in the town of Enniskillen, and one of which was devoted to banking purposes by the Provincial Bank, was the plaintiff; and a Mr. M'Clelland, a local builder, under contract for the erection of a new structure for said Banking Company, on portion of the site, was the defendant. Damages were laid at £2,000 for the injury sustained by plaintiff by reason of the alleged neglect of defendant in not properly shoring up the adjoining (plaintiff's) premises while erecting the new building. The chief count in the summons and plaint was, that the house of the plaintiff was undermined and injured; to which allegation the defendant pleaded it was done by leave of plaintiff, who, being solicitor to the bank, had inspected the drawings and specifications, was fully aware of both the intended and actual proceedings from the commencement, and had veritably given leave to the defendant to proceed as he did. It is unnecessary for us to wade through the various ramifications of legal documents, but suffice it to say, that the questions for the judge and jury were simply—Was the plaintiff's house injured by defendant's negligence or incompetence? and if so, to what extent?

Passing over the able and emphatic statements of counsel on both sides, in laying the claims for consideration of the jury of their respective clients, we come to the evidence. The first witness was Mr. James Creaden, also a local builder, who deposed as follows:

"That he made a record of the state of plaintiff's house before the work of the new bank began, and found *the house and return perfect;* subsequently observed, when excavations were commenced for the new building, that the hall door would not open; had to saw a piece off the bottom; the other doors got jammed at junction of walls; cracks arose; floors had lost their level; walls of drawing-rooms were very damp, though nothing of the kind occurred before the bank was taken down; and at once knew the cause of these and other matters occurring, that it was from *the negligence of the person doing the work*; visited the premises during progress of the bank at least twenty times; as the building went on, cracks increased, and believed the cause was the way in which *underpinning was done;* knew the original gutter between the two houses; the present gutter insufficient to carry off the ordinary rain; the new building raised about fifteen feet above the plaintiff's, and the cornice projects about eighteen inches over plaintiff's house; and if plaintiff wanted to rebuild it would be a dangerous experiment, as the party wall rests on an insecure foundation; the bank carried up half a brick against the party wall; and when they got to the top of the whole, they occupy the whole fourteen inches; thinks, on the whole, it was not a scientific way of building; to remedy the defects would involve building a new house, with separate party wall; estimated plaintiff's house at £1,800 or £1,900 before the building began."

In the course of cross-examination, however, the witness admitted that—

"He saw large pieces of timber employed to support plaintiff's house, and that the bridging *was done as well as possible;* partition wall must have been taken down about three or four years ago; observed no damp when he examined the house first; the houses were built in 1818, by a man *notorious for using bad materials*"!!!

We would specially direct the attention of our readers to the admission on cross-examination, viz., that the bridging or shoring (we presume) of plaintiff's house *was done as well as possible,* and that the original builder of the premises in question was *notorious for using bad materials.* To our minds, significant facts; perhaps the most important elicited during the trial! However, *nous verrons!* The next witness, William Frith, corroborated the last in many respects; but made the *amende honorable* in favour of defendant, by admitting that he had lately heard Dean Boylan swear he (witness) was *not worthy of credit on his oath!*

So much for the evidence so far adduced! But further, we find another builder, Mr. Clegg, a witness on behalf of plaintiff, aver that "Smith, the builder of the houses in question, was in the habit of building for the purpose of selling." Of course of rubbish — mere rubbish, as sworn to by Mr. Creaden, and verified by this witness; yet, strange to say, the house, when separated from its companion, which was to be rebuilt with proper materials and in a permanent manner, exhibited symptoms of insecurity. Curious fact, is it not?—yet facts are disputable!

The evidence of Mr. George Wilkinson, late architect to the Poor Law Commissioners, and an eminent member of the profession—and as respected as eminent—went to show that the underpinning was defective, being only half under the party wall, and not thorough; that the settlements appeared to be of recent growth; and that to the insecurity of the foundation is attributable an incline in the superstructure of two inches towards the bank — the former resting partly on masonry and partly on earth. Would not swear that some of the *cracks were not old!*

Mr. Robert Armstrong, whose name is familiar to many of our readers as the son of an old and respected local builder, although, until recently, for many years practising in London, corroborated the evidence of Mr. Wilkinson, and testified that the underpinning of the entire width of the wall was practicable from one side, without interference with the neighbours; and that, by reason of the sinkings above alluded to, the property had deteriorated one-half in value.

The plaintiff proved that he had expended about £800 in building and repairs. Formerly there were no cracks, the door did not drag, or the wet come in. Heard a noise during the rebuilding of the bank, and immediately a crack appeared in the drawing-room. But on cross-examination pleaded ignorance of the intentions *proposed by plans or specifications,* "and they did not tell him they *were going to excavate or underpin.*"

Here closed the plaintiff's case; and well had it been for the sake of common sense, at least in our minds, that it had never been opened. With the exception of Mr. Wilkinson's evidence, that "the party wall was insufficiently underpinned, being partly resting on masonry and partly on earth," there is not a tittle of evidence worthy the attention of either a practical man or the consideration of a jury.

Now let us hear for the defence. The old bank was alleged to be in a ruinous and dangerous state, and its rebuilding indispensable for the actual safety of the community at large. This was done, with all due caution and regard for the security of the adjoining premises. The cracks in question were attributed to the insecure manner in which the new return was built on the old wall, and not to the reerection of the bank. Further, that the plaintiff gave full leave and licence to the proceedings, and never objected until the work was in a forward state.

The architect, Mr. Roderick Gray, deposed that the underpinning of the party wall was done with greatest care, in portions of two feet at a time, with stones, flags, and Roman cement; did not know if it was the whole way under the wall; specified underpinning, but not *how*; and the foreman, Mr. David Gresham, admitted that from fifteen to eighteen inches was the general thickness of the underpinning; never *saw more care taken in laying a foundation.* Before the work commenced, he plumbed the party wall, and found it overhung, and is in *the same state still.* If the bank had not been taken down, it might have fallen into the lane, and taken plaintiff's house with it.

The other professional gentlemen engaged were Messrs. S. Butler, W. G. Murray, and J. M'Curdy, architects, and Mr. Campbell, builder, who severally deposed in favour of defendant's precaution in the workmanlike prosecution of the work.

After some deliberation, the jury found on 1st, 2nd, 3rd, 7th, 8th, 9th, and 10th counts damages £125 and costs; on the 5th, 6th, 12th, and 13th counts for defendant; and on the 4th count, that £5 lodged in court was enough for the damage. Assuming that a proprietor does sustain damages by reason of the rebuilding of adjoining premises, is it consistent or fair that a builder against whom culpable negligence is *not* proved, should suffer for an unforeseen circumstance, and while acting only as the paid *employeé* of others? *We should say not!* And again, if one man's house be in a tottering state, must his neighbour, having separate title, and keeping on his own territory, be precluded from improvement or rebuilding, because of that fact? It is unconstitutional and unjust! If responsibility exist, why not saddle it on the proprietor, not the builder?

DEVELOPMENT OF RAILWAY SYSTEM.

The railway system, in its almost endless ramifications, and the construction and management of railways, from their importance as instruments of civilization and commerce, no less than the magnitude of the interests at stake, have become not unworthy to occupy the active and practical attention of many of the leading minds of the day. These interests now contribute a large quota of Members to the Legislature; the proportion of Members of the House of Commons who are chairmen, directors, engineers, or contractors of railways, being nearly *one-fifth* of the whole house, and in the Lords nearly *one-tenth*, without taking into account the far larger proportion who, without being office-holders, are proprietors or shareholders, and otherwise interested in railways. More than 130,000 persons are employed as paid officers and servants on railways in the United Kingdom, not including directors and auditors; and these numbers are wholly irrespective of the vast numbers of persons besides, to whom these undertakings furnish habitual employment in private establishments in iron works and factories, in the construction and building of engines, carriages of various kinds, in the supply of coals, coke, oil, clothing, printing and stationery, and in the various other trades and manufactures engaged in supplying the multifarious requirements of railways. The first completed railway in the United Kingdom for general traffic may be taken to be the Liverpool and Manchester, constructed by a company incorporated in 1826, and since, as well as the Grand Junction, amalgated with the London and North Western Company's line. Its opening, in September, 1830, is memorable, no less as the earliest developed example of British enterprise in this direction, than from its attendant fatality in the loss of one of our most distinguished statesmen, whose official position as Vice-President of the Board of Trade brought him in contact with the means of his destruction. The second in the United Kingdom, and the first in Ireland, was the Dublin and Kingstown line, opened in 1834, and now in the hands and under the management of the Dublin and Wicklow Railway Company, in conjunction with their own more recent line. From the year 1821 the extent of railway communication in the United Kingdom has increased from about 32 miles—the length of the Liverpool and Manchester line—to 9,116 miles open for traffic at the end of 1857, besides nearly one-fourth of the latter number in course of construction or authorized. More than 130 millions of passengers travel over these railways in a year: or in other words, so many individual journeys are made. The railways in the United Kingdom had been constructed of different guages in the earlier years, before the passing of the Act of 1846, for regulating the guage of future railways. The general guage is now the narrow guage of 4-8½, prescribed for Great Britain by that Act. The Irish guage of 5-3, now universal in Ireland, is next in extent. The extent of the broad guage of 7 feet is much smaller; and that of lines of mixed guage, or of the narrow and broad guage combined, is the smallest—this double guage existing only on a few lines in England used by different companies, whose own lines are of different guages, and whose carriages, therefore, could not run interchangeably without the double guage. The following table shows the extent of each kind of guage on railways open to 31st December, 1857, and also the extent of railways laid down as single lines:—

Miles of	England.	Scotland.	Ireland.	Total.
Narrow Guage	5,776	1,269	—	7,045
Broad Guage............	740	—	—	740
Mixed Guage......	261	—	—	261
Irish Guage.............	—	—	1,070	1,070
Total..........	6,777	1,269	1.070	9,116
Of which are single lines..	1,715	409	651	2,775

The Dublin and Kingstown (the late Dalkey Atmospheric) and the Ulster lines were constructed originally with the 4-8½ and the 6-2 guages respectively, but have since been altered to the Irish guage of 5-8 inches, and the Atmospheric has been altered to a locomotive line.—*Moore's Handbook of Railway Law.*

THE CRYSTAL PALACE COLLECTION OF BRITISH AND FOREIGN WOODS.

If the Directors of the Crystal Palace at Sydenham have been most active and diligent in catering for the amusement and pleasure of the visitors in concerts, lectures, pictures, &c., they have at the same time been equally thoughtful to provide the more lasting and useful information connected with horticulture, scientific progress, and commercial products

The beautiful collections of growing plants, flowers, and trees, within and without the building, convey a fund of information and pleasure to thousands. And these are made subsidiary to the acquisition of useful knowledge connected with the everyday business of life, and to their relation in the several branches of art, manufactures, and commerce. The details connected with such a vast undertaking require patient assiduity, great watchfulness, and a large outlay of time and money to render them anything like complete.

In view of the growing taste on the part of the public for economic museums, the Directors have for a considerable time past paid great attention to the formation of an Industrial Museum, embracing a collection of commercial products, illustrative of the economic uses of animal, vegetable, and mineral substances. The progress of this collection, which is placed in one of the galleries, we have watched for some time past. Under the able supervision of Mr. David Price, it has now attained to very important dimensions, and will compete creditably with any of the metropolitan collections, surpassing, in some of its branches, many of the special and even more favoured museums, which have Government grants and official prestige in their favour.

The visitor, whether he be of the purely studious or inquiring character, or one satiated with the multifarious amusements, and food for the eye and ear so liberally provided for him at Sydenham, will find he may spend most pleasantly and usefully an hour or two in the Crystal Trade Museum. Is he interested in agriculture or arboriculture? Here he will find a most extensive and valuable collection of all the principal seeds of grasses, cereals, culinary plants, &c., and specimens of the leaves, cones, or seeds of the principal trees. Does he wish to become conversant with drugs, oils, dye-stuffs, tanning substances, or fibrous materials, here is abundant scope for his investigation; all popularly named, scientifically labelled, and fitly described. If he prefer to examine animal substances, here will be seen not only the stuffed animals of the wool-bearing tribes, but a very large and varied collection of wolls, furs, and hair.

In chemical products the Crystal Palace Museum is extremely rich, and no illustration calculated to be useful to the public escapes Dr. Price's watchful and experienced eye. From a long and close attention to these subjects, few are better able to appreciate the arrangement, extent, and practical utility of this collection, which, if it advances as rapidly as it has done of late, will soon become a most important and highly valuable technological museum. Much as we admire the collection in its entirety, we are necessarily constrained to devote our present notice to those materials which fall most within the scope of the objects of this journal, the building materials, and those fitted for constructive purposes in general.

The collection of woods, British and Foreign, is numerous, and what is more, they are all scientifically named and described, and an arboretum is in the course of formation in the Palace grounds, where the living trees may be studied in their fair proportions, at least all those which are suitable to our climate.—*Building News.*

MACHINERY AT THE ROYAL AGRICULTURAL SOCIETY'S SHOW, DUNDALK.

AMONGST the many mechanical appliances exhibited at the recent show at Dundalk, may have been noticed the following:—Portable steam engines for threshing, sowing, and other purposes, of various powers; portable machines (not worked by steam) for threshing, sowing, grinding, &c.; improved oat and bean bruisers, for steam, horse, and water power; improved machines for cutting chaff, for sowing turnips (in double or single drills), for reaping and mowing, for making hay, and for broadcast sowing. Then there are improved ploughs, of every possible kind, and for all descriptions of work; improved harrows, drill grubbers, subsoil pulverizers, rollers, and rakes; improved churning machines, kneading machines, weighing machines, grinding machines, and washing machines. In short, there is exhibited every article ingenuity could devise to lessen the labour and facilitate the operations of husbandry in all its stages, besides farm requisites of various descriptions, such as wrought-iron gates, fences, rick-stands, wire-proof netting, round barred hurdles, revolving pig troughs, dog troughs, and poultry troughs, improved stall ventilators and mangers, hay racks, &c., and all agricultural requirements of this country. Amongst the leading English and Scotch exhibitors in this department were—John Gray & Co., Uddingston; Barrett, Exall, and Andrews, Reading; Richard Garrett and Sons, Saxmundham, Suffolk; Ransomes and Sons, Ipswich; Smith and Ashby, Stamford; B. Samnelson, Banbury; Clayton, Shuttleworth, and Co., Lincoln; E. R. & F. Turner, Ipswich; Thomas Bradford, Manchester; James Haywood, jun., Derby; Williamson, Brothers, Kendal; Woods and Son, Stowmarket; T. & F. Howard, Bedford; Picksley, Sims and Co., Bedford: R Hornsby and Son, Grantham; Richmond and Chandler, Salford; R. Forshaw and Co., Liverpool; W. M. Cranston, London; and Robert Law, Glasgow. The Irish exhibitors were:—James Shekleton, Dundalk; W. & J. Ritchie, Ardee; Thomas Kennan and Son, Dublin; Musgrave, Brothers, Belfast; William O'Neill, Athy; David Boucher, Belfast; A. MacDonald, Belfast; A. W. Russell, Wilson, and Mann, Belfast; Miller & Co., Dunleer; J. M'Connell, Dunleer; J. M'Kenna, Louth; Robert Law, Belfast; Matthew Kearney, Dublin; James J. Mitchell, Dublin; — Brook, Dublin; Riddell and Co., Belfast; John B. Mitchell, Dublin; Patrick Crolly, Dundalk; John M'Grath, Chancery-place, Dublin; and John Farquharson, Dundalk. The Earl of Enniskillen and Sir John Macneil exhibited a collection of drainage tiles, &c. It will be observed that several Dublin manufacturers who have obtained a high reputation for the excellence of their workmanship are not represented at the present exhibition.—*Freeman.*

The town of Balbriggan, Co. Dublin, is much indebted for improvement to the kind philanthropy of George Woods, Esq., of Milverton Hall, who has just completed a schoolhouse, with accommodation for teacher, the whole enclosed by neat surrounding walls. The building is of Italian character, in coursed rubble of Milverton stone, having wrought dressings and chimneys of brick, forming pleasing contrast and exhibiting an excellent specimen of masonry. There are two schoolrooms, for accommodation of 40 children each, together with yards, garden, &c. The plans were prepared by Mr. S. Symes, architect, and the work has been ably carried out by Mr. James Caffry, of Balbriggan. We understand the total cost will exceed £600.

ARCHITECTURAL IMPROVEMENTS IN THE VICINITY OF BALLYMENA.

ON a recent visit to Ballymena, we were gratified by an opportunity of inspecting a handsome and spacious mansion which has lately been erected at Mount Pleasant, in the vicinity of that town, for William Dunseath, Esq., one of its most respectable and extensive linen manufacturers. The house is conspicuous from the railway, at a short distance to the left of the line, after leaving the Ballymena station to proceed towards Ballymoney. The new entrance to the demesne is from the Galgorm Road, at which ornamental stone pillars, with iron gates and railing, have been erected, as also a handsome lodge, for a porter's residence, in style to correspond with the house. The house is situated on an eminence, and commands a rich and varied prospect. It is approached by an avenue, recently formed, and having very graceful curves, resembling the letter S, and affording an easy incline up to the house. The exterior of the edifice presents an imposing appearance, elevated towards the south and east on a terrace, covered with fine grass. The door and window openings, with the quoins and chimney shafts, are furnished with ornamental carved stone dressings. A bold, projecting cornice, highly ornamented, conceals the lower portion of slated roof, the plain surfaces of the walls being finished in Portland cement, producing so close a resemblance to cut stone as to require a practised eye to detect the difference. The style of architecture is Italian in character. The sashes of the principal fronts are each filled with a single pane of plate glass, and produce a fine effect, as they reflect the beautiful foliage of the stately trees which beautify the lawn and pleasure-grounds. On arriving at the hall door, you enter a porch which is screened from the hall by spacious sash door and side lights, filled with large panels of plate-glass. The hall is spacious, having ornamental columns with suitable decorations between it and the grand staircase, which latter, from its large window with carved dressings, filled with stained-glass, and its enriched stucco-panelled ceiling, is very effective. The suite of spacious reception-rooms are to the right of the hall as you enter, and communicate with each other by means of double doors, to exclude sound and draft. These are fitted up in a chaste and elegant style, without being too elaborate. To the left of the hall we observed a very convenient coat and hat-room, having marble wash-basin, with water-closet beyond, entered from coat-room. The culinary offices are replete with all the modern improvements. The chambers and dressing-closets are numerous and spacious, having hot, cold, and shower baths, with water-closets, all conveniently situated. The stable and farm-offices, whilst they are judiciously placed at a short distance from the house, are concealed from being too prominent a feature by the natural position of the site, and by suitable planting. The whole forms a most convenient and comfortable abode for a gentleman of taste, and having means to gratify it. We noticed in the hall one of Messrs. Musgraves' very ornamental patent slow-combustion stoves, which must in winter contribute materially to the comfort of the inmates. Arrangements have been made to afford a constant supply of fresh air, to ascend from under, and pass around the stove, so as to become heated and diffused through the house—air flues, with Looker's patent ventilators, being introduced in the chimney breasts of the several rooms to convey away the vitiated or used-up air of the apartments. We learned that the designs had been procured from, and the work executed under the direction and superintendence of Mr. Jackson, architect.—*Belfast Paper.*

PREMIUMS AWARDED BY INSTITUTION OF CIVIL ENGINEERS, LONDON.—The council of the Institution of Civil Engineers have awarded the following premiums for papers read during the session recently concluded:—

1. A Telford Medal to M. Scott, for his paper "Description of a Breakwater at the Port of Blyth, and of Improvements in Breakwaters, applicable to Harbours of Refuge."

2. A Telford Medal to R. Mallet, for his paper "On the Co-efficients of Elasticity, and of Rupture in Wrought Iron, in relation to the Volume of the Metallic Mass, its Metallurgic Treatment, and the Axial Direction of its constituent Crystals."

3. A Telford Medal to H. Bessemer, for his paper "On the Manufacture of Malleable Iron and Steel."

4. A Telford Medal, and the Manby Premium in Books, to W. J. Kingsbury, for his paper "Description of the Entrance, Entrance-lock, and Jetty Walls of the Victoria (London) Docks; with Remarks on the Form adopted in the Construction of the Wrought-iron Gates and Caisson."

5. A Watt Medal to J W. Jameson, for his paper "On the Performances of the Screw Steam-ship 'Sahel,' fitted with Du Tremblay's Combined Vapour Engine, and of the sister Ship 'Oasis,' with Steam-engines worked expansively, and provided with partial surface Condensation."

6. A Council Premium of Books to T. S Isaac, for his paper "On the Successful Working, by Locomotive Power, over Gradients of 1 in 17 and Curves of 300 feet radius, on Inclines in America."

7. A Council Premium of Books to M. B. Jackson, for his paper "Description of the Gravitation Water Works at Melbourne, South Australia."

THE NEW NATIONAL GALLERY.

During a recent visit to the works at the new National Gallery on Leinster Lawn, we found them progressing with rapidity, the level of first floor being now nearly reached, and all the principal floor windows, with the rusticated stone-work, fully formed. Externally, the building will be similar to the corresponding wing, viz., the new Museum; and it is to be connected with the Royal Dublin Society's house by means of an open Corinthian colonnade, of quadrant form. Internally, the building will be divided by a main wall into two compartments; but as yet the proposed arrangements are involved in obscurity. The granite stone used for the plinth course, the rustic work and the ashler facings, &c., is from Ballyknockin quarrys (Reilly's), and the ornamental cornice, pediments, dressings, &c., are of Portland stone. The building is being executed according to directions of Sir Richard Griffith, Bart. Messrs. Cockburn & Son are executing the works in their usual excellent style; Mr. Mellon, C.W.

THE DESIGNS FOR THE NEW FOREIGN OFFICE.

In the House of Commons, on the 15th ult., Mr. Tite asked the First Commissioner of Works whether he had any objection to place the drawings for the New Foreign Office, together with the designs to which the two first premiums were formerly awarded, in the Library of the House, with as little delay as possible, and without waiting for the tenders from the builders for the actual construction of the Gothic design. Mr. Fitzroy said, as it was the wish of hon. members to have another opportunity of inspecting these plans, he went yesterday to select a place which would be convenient for their exhibition. He thought the Library would not be a convenient place for the purpose, as reference was being continually made to the books. He had, therefore, ordered them to be placed in the Reading-room, on the right hand side of the House; when the estimates and tenders were sent in they would also be shown in the same room.

STEEL ELECTROTYPES.

Messrs. Salmon and Garnier place the newly-engraved copperplate in the bath, where, by their recently-discovered process, it is duly coated with steel, without the least hurt to the engraving. In this way is produced a steel plate for a copper plate, and steel being much harder than copper, a much greater number of impressions can be printed from the improved surface than from the simple plate. As soon as it shows signs of wear the surface of steel is dissolved, and a new surface formed by the means previously employed. This process will tend to reduce the price of really fine engravings, and if carefully followed up the last impression will be scarcely less beautiful than the first.

KELLS ABBEY, KILKENNY.

There are several places in Ireland of the name of Kells, one of which is situated about six miles from the town of Kilkenny. A priory was established here in 1183, by Geoffrey FitzRobert, one of the followers of Strongbow. The first monks were brought over from Bodmin, in Cornwall. The neighbourhood was the scene of many historical events. It was occupied by Edward Bruce in 1316. At the dissolution of the monasteries in the reign of Henry VIII. of England, the priory was granted to the Earl of Ormonde. The prior of Kells had been a lord of parliament. Several towers and part of the walls remain.—*The Lamp.*

Capability of Ericsson's Caloric Engine.—A small engine, 6 feet by 2, which drives one of Hoe's double cylinder presses, on which the *Cincinnati Daily Press* is printed, is thus described:—

Size (diameter) of cylinder	24 inches.
Power of engine	5 horse.
Motive Power	hot air.
Weight of engine	1¼ tons.
Composed entirely of	iron and brass.
Space engine occupies	6 feet by 2.
Fuel	coal, coke, or wood.
Use of engine	To drive Hoe's double-cylinder press.
Usual number (per hour) of impressions of *Daily Press*	3,500
Often run off per hour	4,000
Cost of fuel per hour	ONE CENT.

We employ only the complement of hands necessary for the press. Nominally "the engine takes care of itself!" The saving to our pocket of "Caloric" over steam, is three dollars per day. We believe the day is fast approaching when locomotives on our railroads, and boats on our rivers, will be propelled by "Ericsson's Caloric Engines." What a blessing to the world! No more explosions!!

MONUMENTAL.

We have had an opportunity of personally inspecting at the establishment of Mr. Alexander Ballantine, in this city, a monument to be erected in Kilbrogan church, diocese of Cork, to the memory of the Rev. Henry Gilman, curate of the parish, and in point of design and execution, it is very excellent. The style is gothic, and the material statuary marble with black marble ground. Angular pilasters or buttresses supported on brackets, terminated at top with Gothic pinnacles, and connected by a handsomely carved arch above the inscription table, are the chief features. Over the inscription is a Gothic shield, with the crest and garter underneath, and the motto "*Non cantu sed actu,*" and above is an octagon tablet, an open Bible, and an elaborate canopy.

In a recent thunderstorm the newly-erected Cole Testimonial at Enniskillen was struck by lightning, and some of the stones torn to atoms. We believe, however, the damage done does not affect the stability of the structure, and that the requisite repairs may be made by a trifling expenditure.

THE CARPENTER.

You know our friend the Carpenter;
We hear him all day long:
No lark is ever merrier,
No blither is her song.
Sharp falls his hammer,
Swift slides the plane,
Then the awl, and then the chisel,
Then he sings again.

Within his little attic
What little comforts lurk:
He sleepeth there throughout the night,
But at dawn he's up at work.
Then he plies the screw-driver,
Then he drives the plane;
Then he sings thro' his merry meal,
And then he works again.

All the week he is a carpenter,
As busy as the bees;
But on Sunday he's a gentleman,
And then he takes his ease.
Then his tools are laid aside,
And he has welcome rest;
Or he takes the air with her he loves,
With her that loves him best.

And so, long live the Carpenter!
Long live his rosy wife!
May children come and lengthen out
Their happy span of life.
May health and strength ne'er fail him,
From sorrow or from pain;
May he sing and work, with all his heart,
And work and sing again.

—*All the Year Round.*

Mediæval open Timber Roofs may be classed in four main divisions, namely, tie beam, trussed rafter, or single framed—framed with hammer beams and braces; and with collars and braces, or with the latter only. The first were never entirely discarded by the Mediæval architects, they are to be met with in Norman, early English, decorated and perpendicular buildings. The tie beam was sometimes used in roofs of the middle ages quite independently of the other timbers, being simply laid across the walls, and in all likelihood pinned down to the wall plates. The trussed rafter roof was probably chosen originally for the purpose of gaining headway, and having been once had recourse to, its superiority both as regards construction and general appearance over the tie beam could not but lead to its being preferred and substituted for the latter. In roofs of a wide space, each pair of rafters had a collar, and was also further stiffened by braces crossing at times above the collar, and at others tenoned into its underside. Hammer beam roofs have hitherto been usually represented as backing a portion of the tie beam, as if it had partly been cut away, but there appears to be no reason assigned for the supposition. The architects of the middle ages cast off the restrictions imposed on them by the unsightly tie beam, and acquired greater freedom in designing. In this peculiar feature England may be pronounced unrivalled. Of collar braced roofs there are some very beautiful specimens extant displaying a variety in construction as well with collar beams as of braces simply connecting the wall pieces and principals together.

WATER SUPPLY AND SEWERAGE OF CITIES.

HAVING recently concluded a series of articles on the Sewerage question, we now pause to give an open for the views of others, *pro* or *con*, which, although our space may not allow us to insert *in extenso*, we shall faithfully record in substance, should they reach us.

There are no subjects connected with the health and welfare of the general community of greater importance than those with which we head this article. Pure air and pure water are the paramount essentials to health, and health the paramount essential to the successes and happinesses of life. Without it, what is our existence? A never-ceasing labour, a never-ending effort to stand up, whilst, if we dare, we would lie down — would succumb to the lassitude with which want of health envelopes us; and which in nine cases out of ten is the offspring of the foul air and foul water which the large majority of the inhabitants of all large towns are obliged to inhale and imbibe.

It is idle—worse than idle—for the sticklers for the old regime to hope that *sneers* will longer stifle general intelligence. *The public*, happily, begin to think for themselves. For ages the professions, trades, and callings of life were deemed to be well and honorably upheld and represented if the representatives of each well performed his part in it alone. A lawyer was expected to be a lawyer only—a physician, to be a physician only — an engineer only an engineer — a merchant merely a merchant—a tailor simply a tailor. Happily those days have passed; general education has produced general intelligence, and the tailor (as well as the lawyer and the physician and the engineer) is no longer chained to his shopboard. The errors and fallacies of *professors* can now be understood by the general community, because it is taught and seeks for general information. Every day gives us proof that great evils have arisen from past professional narrow-mindedness and prejudice, by which the most glorious discoveries have been ignored and held back. And as we have before said, it is now idle for the old school to sneer at changes which must take place, because general intelligence will force the change; and amongst the foremost of those essential to humanity are proper appliances for the supply of pure air and pure water to cities and towns.

We look forward, then, with anxiety, not feigned, for the views of others upon the *sewerage question*; we feel not a little national jealousy in the matter; we cannot doubt that others of our profession and of our fellow-countrymen begin to think there *is* a necessity for a radical change, and it would delight us that the problem were solved *in Ireland*; whilst, on the other hand, we feel that a stain and degradation will hang upon us, if we supinely follow what appears to us to be so fallacious. Have we no professional knowledge in this country capable of thoroughly investigating the question, and showing the existing sewerage system to be right, or that the suggested remedy is wrong? Waiting this hoped-for advent, we now turn to

THE WATER SUPPLY!

On this question, London, Dublin, Liverpool, Edinburgh, Glasgow, and Belfast—the leading cities of the United Kingdom—have already paid the penalties of public jobbing and mistaken engineering. We would hope better for Dublin at present; but we have our fears, and should like that others might form judgments upon the subject as well as ourselves. Hence the course which we purpose following.

We shall endeavour to point out what has been done and left undone in the public water supply, and perhaps the experiences of London, Dublin, Liverpool, and Glasgow, may be sufficient to guide us to a better *water-course*. The history of the past supply of London and Dublin is scarcely possible to believe, it is so thoroughly an exemplification of "*company humbug*" and dishonesty, in contravention of communal rights; for it is as much the right of every inhabitant of a town to be supplied by the constituted authorities with pure water at first cost, as it is his right to "protection of life and limb," from the same source. The congregation of mankind in towns, is designed for mutual and general good, not for individual aggrandizement and public wrong. London and Dublin, however, exhibit so contrary a picture, that one would wish, if possible, not to look at it; but we must, as a warning for the future.

The water supply of London has been, from first to last, the work of *companies*, formed for different districts. The water is drawn from the Thames, except that supplied by "The New River Company," the projector of which was said to be mad, and having expended the whole of his means, he was driven to destitution whilst laying the foundation for one of the most paying undertakings on record. Alas! for projectors! For the company, however, he established rights which could not be overset, and the public has since been mulcted to an extent perhaps unprecedented. The other companies, following in their wake as to charges, pumped up the water in some instances from the very sewer mouths—literally supplying the inhabitants of the districts with the seeds of disease, till fever and cholera burst out and carried off hundreds.

The statistics of disease in London tell a tale on this score that disgraces humanity;—men, women, and children were supplied with water to drink containing a mass of festering life—a body of living animalculæ, gloating on the foulest essences of the foulest human matter. The poor could get nothing else to assuage their thirst, and they drank of it to die; whilst those who had the means to save themselves from death in that way, were driven perhaps to death by gin, as their *dernier resort*. All the while the water companies filled their coffers and the coffins of the wretched beings that thus supplied the gold, the authorities of London looking on until the public press, in its honesty, disclosed such facts, that even stolid cupidity was made ashamed; and the wrong so far set right that with wondrous liberality the water was at last filtered, and the companies lauded! It will scarcely be credited that so powerful was the grasp of these companies on their ill-gotten gains, so great their influence, that a public effort made to establish a water supply from a comparatively pure stream — the river Wandle—was ousted, by the bill for the establishment of the company being thrown out; and the public of London is still supplied from the Thames as before, with this difference, that the water is said to be filtered. It is right to add that in one locality the decrease of deaths, since filtration has been effected, was above 15 per cent.—a fact plainly indicative of the foulness of the water.

Happily, the press and the public of London were so intent on exposing the facts of the water supply, that the companies were driven to bestir themselves, and within the last five years a great improvement has taken place, but by no means what it should. London is not supplied as it ought to be, as to purity or quantity; and in place of the inhabitants paying *only what the supply costs*, they are mulcted in a large profit to the shareholders of the companies.

Let us take warning by this and by what has taken place in Dublin in past times, and buy our water in the cheapest market.

It is not so long since the mysteries of the *metal main corporation* of Dublin were partially unravelled, that many of its inhabitants do not recollect the *exposure* of one of the most extraordinary and disgraceful frauds that can well be conceived.

With a wondrous flourish of trumpets, the Corporation of Dublin announced their determination to save the inhabitants from the degradation and misery of being supplied with water conveyed to them through *wooden* mains. Meetings were convened to enlighten the townsfolk as to the damage they were sustaining by drinking water flowing through wood. The most satisfactory proofs were given, to those who did not think that water should never be allowed to pass through anything but metal, and the population at large were perfectly convinced; not one of them apparently recollecting that nine-tenths of the pumps in the country were wood, and that not one but the metal main projectors ever made war against the water that came through them. But so it was; various reasons were given and believed, and eventually the citizens generally became so satisfied of the necessity for change, that a unanimous voice declared for metal! just in the same way as the inhabitants are now being talked into the belief that canal water is bad, and that the water to be caught in the mountains of Dublin, flowing over the bogs and manured lands of the locality is good. An act of parliament was obtained—metal mains became a popular necessity, and a body of corporators were nominated to carry out the measure. It was to be all completed in some wondrously short time, and for so moderate an amount, that nobody would care about the tax; whilst one of the commissioners, a philanthropist who lent his name and his guinea to every charity in Dublin, declared his belief the water would be so pure that it would be drunk in preference to whiskey punch, which, in those days, was about as great a necessity as water itself. In short, a more popular undertaking never was commenced in Dublin. The whole proceeding was very much of a piece with the meetings and reports and analyses of the water which the citizens are now using, and what—according to the projectors of the present water scheme—they ought to use—these gentlemen evidently feeling the most intense anxiety for the health of the citizens, and having nothing else in the world in view!

But, alas! for the after-facts. The Corporation began their labours—the metal mains began to be laid down—the tax began to come in—and the whole operation was found to be so agreeable *to the Corporation*, that they apparently determined to continue it *ad infinitum*. It went on so long, in fact, that the people at last saw it would never end unless they took vigorous means to stop it; to the honor of one individual, now the respected secretary of a public body in Dublin, one of the most scandalous jobs that ever disgraced a city was unveiled, after years of legal contest; when the citizens were at last relieved by act of parliament from the tax. But about one hundred and fifty thousand pounds were gone—deficient—*non est inventus*—and, from that time to the present, no one except the Corporation can tell into whose pockets the money went; although the citizens of that day were perfectly aware that it came *out* of theirs.

So far as to the water supplies of London and Dublin. Let us be awake, then, to take care that popular excitement shall not again lead us astray under clever guidance, and that according to the principles of political economy, we shall buy the water we may want at the cheapest market, and not let it be sold to us again at the dearest.

In our next article we shall point out how Liverpool and Glasgow have fared in their water supplies.

ART-UNION OF IRELAND.

WE would specially direct public attention to the following circular addressed to agents by the secretary of this body :—

"I have the pleasure to transmit copies of the Report of the Art-Union of Ireland for the past year, for presentation to the Members who have subscribed through your agency, and for such further extended circulation as you may be able to effect, with a view to making the objects and working of our Association widely known, and securing for it the support of all interested in the progress and prosperity of the Fine Arts.

The Committee, re-elected for the present year, desire me to thank you for your past exertions, and to invite your continued zealous co-operation. They do so with the greater confidence because the result of their first year's operations may be fairly pointed to as successfully establishing the soundness of the principles on which their plan is based. Those principles are mainly two: the allocation of their entire fund, less expenses, to a prize fund; and the right of selection in all cases by prize-holders. Under this system, with even the small sum available for their first year, they have been enabled so to divide the prize fund as to bring the chances of success nearly to one in every six subscribers. The successful working of the right of selection is best exemplified by the list of selection by prize-holders, published in the Report; which, though many selections remain yet to be made, exhibits the variety, the class, and the value of works of art which have been obtained for even the lowest prize of One Guinea. From this list also it will be perceived how promptly prize-holders have availed themselves of the power of adding to the amount of their several prizes, and it is a gratifying result that twenty per cent. has been added on the average, and the small prize fund of £580 will have been thus increased to about £700. It is needless to point to the immense importance of such a system in developing talent and promoting the taste for art, if adequately supported by public patronage.

It remains, further, only to point to the beneficial influence of the Art-Union in regard to Public Exhibitions in Ireland as already experienced. That of the Royal Hibernian Academy for the current season has been pronounced the best held within its walls for many years, and the agreeable result has been, that by private, in conjunction with Art-Union, purchases, nearly £1,000 have been already expended in the Exhibition, while last season the entire purchases did not exceed £150. Some selections have also been made by prize-holders in the Belfast Exhibition, satisfactorily illustrating, even on a small scale, the advantages of the system of our Association, which seeks to be an Art-Union for Ireland at large, and to advance the interests of art by promoting local Exhibitions.

In the interests of these Exhibtions, on the extension and improvement of which the vitality of the Art-Union will much depend, the Committee desire me to request that you will kindly use your best exertions to induce early subscriptions, as it will be most important that the Committee shall be in a position within a few months to announce with certainty, as they trust they will be enabled to do, a largely increased fund for distribution in April, 1860, an announcement which they are confident must insure good Exhibitions in Ireland."

ADDRESS OF COMMITTEE.—This NEW ART-UNION has already obtained very important support. It has been established under the auspices of the Committee of the Irish Institution in connection with the National Gallery of Ireland, and it is hoped that the list of its Trustees and Managers will afford the most satisfactory assurance that their duties to the Subscribers and the Artists will be zealously and faithfully discharged.

But it is not merely on these grounds that this attempt to add another to the already numerous Institutions of this character invites public attention. If there was nothing more in its claims to distinguish it from existing Art-Union Societies, it could hardly expect to attain to any permanent or useful position, nor would its founders have suggested its formation. It aims at the attainment of the true ends of such Associations, and seeks to advance them by the most effective means.

Art-Unions may be considered in relation, first, to the Artist; secondly, to the public. The complaint of Artists, more especially in Ireland, has long been, that they suffer from the decline of patronage. Whatever may have been the causes, the fact of this decline is too patent and undeniable. Without encouragement the Artist's struggle becomes hopeless. Year after year his works are displayed in vain, and he either abandons his studies in despair, or seeks in a wealthier land, and from a more generous public, the patronage he has failed to secure at home. The Art itself languishes; and perhaps ungenerous criticism will not scruple to justify, in this decay, the cold neglect whose chilling influence has produced or accelerated the blight.

To supply, by the combined aid of general but moderate subscriptions, this absence of individual patronage, is, as it ought to be, the first object of an Art-Union; and that Association best fulfils the purpose of its existence, which the most fully and largely secures to the Artist the purchase of his works. It is so far, and in proportion as their funds have been thus devoted, that the Art-Unions which have been, or are now, in existence, have improved the condition of Artists as a body, and advanced the general character of Art Exhibitions in England and Scotland. Let us hope that it may yet be possible, by like means, to produce similar results in Ireland.

As regards the public, the influence of Art-Unions, if well directed, cannot fail to be of considerable importance, apart from, and above, the mere gratification of success in the chances of distribution, or even the higher enjoyment every generous mind must feel in the assistance thus given to struggling talent. They ought to be made the means of improving public taste, advancing the knowledge of the principles of Art, and teaching an enlightened judgment and a well-founded power of discrimination.

It is to the best mode of attaining these advantages, to the Artist and to the public, that the promoters of the Art-Union of Ireland have directed their attention, and upon this basis they have framed their prospectus. Accordingly, with the view of devoting the greatest part of their available funds to the purchase of works of Art, and so to the most extensive patronage of the Artists that it may be in their power to bestow, they have excluded from their arrangements the expenditure of any portion of those funds in the preparation or purchase of engravings for general distribution among the subscribers. This distinguishing feature of their plan may at first sight diminish its attractiveness, and has caused some dissatisfaction; a few considerations, even of mere economy, will probably reconcile the Subscribers and the public to the omission; to the general body of Artists it is one of direct and paramount advantage.

Few, perhaps, look into the published accounts of Art-Unions; but those who have any curiosity to do so will be no little surprised at finding what an enormous proportion of the subscriptions is expended on these engravings. A glance at the accounts of the London Art-Union, for the year 1857-8, will exhibit enough of this kind of disbursement to illustrate the subject. The total amount of subscriptions for the year was 11,658*l.* 3*s.* Of this the sum of 3,350*l.* 5*s.* 7*d.* appears to have been expended in the working management of the Institution, for salaries, agencies, printing, and reserved fund; 2,998*l.* 17*s.* 5*d.* devoted to the expenditure on engraving; 2,249*l.* in the preparation of certain statuettes and similar objects for the smaller prizes; and about 3,060*l.* in all, allotted to the legitimate purposes of the union, the purchase of works of Art. Thus it may be said, that about one-fourth of the amount subscribed was made available to the benefit of the general purpose of the patronage of Artists. By the published report of the Glasgow Art-Union for 1854-55, the latest that could be referred to, the total receipts are given at 20,336*l.* 17*s.* 8*d.* The expenditure on bronzes, statuettes, and chromo-lithographs, appears to have been 1,500*l.*; on engraving, about 6,000*l.*; 6,000*l.* for general expenses, reserved fund, &c.; leaving but 6,869*l*, about one-third of the entire, for the purchase of paintings. An examination of the accounts of all the other Art-Unions adopting the same practice will exhibit similar results.

Can such expenditure as this, out of such large funds, truly represent the fit destination of them in the genuine interests of Art? The Committee of the Art-Union of Ireland does not so regard it; and whatever may be the amount of the public subscription to their funds, they have resolved, that after all necessary expenditure in the management of their trust, those funds shall be legitimately dedicated to the patronage of the general body of Artists, through the successful holders of their shares.

Every expenditure which encroaches on the funds destined to prizes must necessarily diminish their number; and accordingly it is found that, in the existing Art-Unions, the prizes are in number very disproportionate to the numbers of the Shareholders. In the London Art-Unions, from this cause, the number of prizes, including those consisting of objects expressly manufactured for the Committee of that body, and so in a scarcely appreciable degree beneficial to Artists in general, amounted in last year to only 980, being about the rate of one prize to every twelve shareholders; and of these, 870 were minor prizes of statuettes, medals, and other low-priced objects, and but 110 were of sums which might properly be designated as high-class prizes. In the Glasgow Art-Union for the year 1854-5, the proportion appears to have been about one prize for every fifteen shareholders; in later years it would seem to be somewhat higher. Like proportions will be found in every other of these Associations; whereas by allotting the entire fund to prizes, as proposed by the Art-Union of Ireland, it is calculated that the proportion of all the prizes, making large provision for those of the higher class, may be justly estimated at about one in every six. The shareholders will thus have, in consequence, almost double the chances of success that other Art-Unions propose, and of course a far more assured prospect of becoming prizeholders in a short series of years.

To the general body of Artists, then, the proposed arrangement promises the largest results from the subscribed fund. Every prize, from the highest to the lowest, must be devoted by the holder of it to the purchase of some work of Art, all above £5 to be selected from Paintings or Sculpture exhibited in Ireland. Prizes of lower amount may also be so expended, or, at the option of the winner, employed in the purchase of a statuette, high class engraving, or other object of the like artistic character which may at the time be on sale in Ireland; the Committee, even in this last branch of their arrangements, endeavouring to diffuse the benefit of their funds as widely as possible among the producers of such work, while they leave to the prizeholder, within these limits, the absolute choice of that which he may prefer.

It is in this absolute power of choice, on the part of the prizeholders, that Art-Unions best provide for the attainment of the further purpose of their establishment — the improvement of public taste, knowledge, and judgment in matters of Art. The selection of one among many objects, as the best, involves the whole subject of artistic criticism, from its lowest to its highest principles—from the investigation of mere technical detail to the apprehension of the most elevated expressions of natural beauty or poetic feeling. Every man who proceeds to make choice of a picture must, in a greater or less degree, exercise the power of discrimination and, in the very act of exercising it, the most untutored eye cannot fail to make some advance; and even its mistakes will probably lead to some correction of an erroneous judgment or deficient taste—of a false appreciation of colour or form, or of an inadequate estimate of artistic power in drawing or composition. Nothing of this knowledge can be gained by the distribution of prizes, in the selection of which the successful holder has had no choice; he but gains the possession of a work, perhaps the very last he would have chosen if left free to judge for himself, and which, for all purposes of value or interest to him, will rarely reach beyond the acquisition of a piece of ordinary furniture.

To the Artist, then, and to the public, the Prospectus of the Art-Union of Ireland offers all the advantages which these modern Institutions are capable of affording, and promises the fulfilment of their true design, in a manner the best and most comprehensive; and the Association, if crowned with success, cannot fail to present great inducements to the general body of those engaged professionally in their production, to place their works in the Annual Exhibitions of the Royal Hibernian Academy, from which, or other Exhibitions in Ireland, all the chief prizes must be selected.

Signed on the part of the Committee,

MAZIERE BRADY, *Chairman.*
G. F. MULVANY, *Secretary.*

STRENGTH AND DURABILITY OF THE OAK.—As a familiar instance, we may mention the carved oaken shrine of Edward the Confessor, in Westminister Abbey, executed some 800 years since. At Winchester, in St. Stephen's Chapel, is preserved, as one of the chief curiosities of the place, a circular table of oak, eighteen feet across, and all in one centre piece; being, in fact, a transverse slice from the trunk of an immense tree. There is abundant and direct evidence that it has been in the place where it now is for 700 years. At Greenstead, near Ongar, in Essex, there is a very curious old wooden church, the walls of which are framed of oak trunks split through the centre, and roughly pegged together. This church is believed to have been hastily put up, more than 900 years ago, as a temporary *sanctum* for the body of St. Edmund (slain A.D. 946), and afterwards converted into a parish church, with some slight additions and alterations. The original timbers, after this immense lapse of time, are still sound internally, and may probably last yet as long a time as they have done already.

THE SOUTHERN SUBURBS—RATHMINES, RATHGAR, &c.

THE township of Rathmines is the most important, and one of the most delightful outlets about Dublin, and, within the last few years, it has progressed with unprecedented rapidity, both in extent and population. To the admirable and energetic arrangements of the Commissioners appointed under the act 10 and 11, Vic. cap. 253, is this fact mainly attributable, and, unlike many other bodies, they seem never to rest on their oars, but continually are directing their steps in a progressive direction. Green fields have speedily given way to continous roads and handsomely laid out squares; the dwellings being in many instances of a first-class character, and those of modern construction especially seldom degenerating beyond what are professionally known as third-rate structures. Moreover, they are in every variety of plan—detached, semi-detached, and in terraces; and in every variety of design externally likewise, from the "cozy" cottage to the "lordly mansion," with all the appendages that the landscape gardening art can contribute; and, we may add, in every variety of material, from simple pebble-dashing to smooth-faced cementing with decorative cornices, mouldings, &c., &c. We must, however, notice that occasionally the latter material furnishes an inducement to building proprietors to be somewhat lavish of their ornamentation, and not always judiciously treated, as a very mongrel and fillagree character has crept into a few recently erected dwellings, evidencing the absence of a professional hand. The new church and the proposed road improvements (as already noticed in the "DUBLIN BUILDER"), will prove acquisitions, and supply a decided want long felt in the locality.

To speak of this township as a suburb, is probably a misnomer; it is as *de facto* part and parcel of Dublin, as any of the many districts connected by endless lines of streets with the modern Babylon, and enjoying collectively the title of London. At the junction of Rathmines with Rathgar and Rathmines upper, a "business town" has sprung up within the last few years, wherein all the requirements of the outward man may be satisfied; and nothing is wanting to minister both to the necessities and the luxuries of the neighbouring inhabitants.

In sanitary matters the arrangements of the Commissioners are creditable, and we hear nought of defective sewerage, stagnant drains, insufficiency of water, &c., &c., so frequently a cause for complaint in other localities, and moreover the township is well lighted, the roads preserved in good order, and regularly watered &c., &c. Various private dwellings are in course of erection, including those for Thomas Dunnill, Fletcher, and William Acheson, Esqrs., Grosvenor-road—Mr. Bolton, builder and two semi-detached for C.E. Draper, Esq.—Mr. John Butler, builder. On the Rathgar road, for John Wilson, Esq —Mr. Hugh Kelly, builder; and two are about being erected for Mr. Sherry in Frankfort-avenue, all under the directions of Mr. E. H. Carson, architect; as well as a number of others from designs by various local architects.

OUR BRIDGES.

WE Dubliners may and do point with some pride to our public buildings; to our quays for extent and beauty unsurpassed in the world; to Sackville-street as the widest, if *not* the noblest thoroughfare in the United Kingdom; to our squares for their simple, uniform, and *rus in urbe* character; and to our Phœnix Park as the most salubrious, picturesquely situated, and extensive sojourn in the neighbourhood of any metroplis, but in regard to the bridges that span our rivers and canals we must acknowledge a palpable deficiency, even with towns of much less commercial importance. Carlisle-bridge, over which passes three-fourths of the traffic of the city from north to south, and *vice versa*, is totally unsuited for its purpose. Much as its architectural beauty must be admitted, we cannot refrain from condemning it in common with the public in point of utility, as unworthy the position it occupies in the heart of this great metropolis. Practically there is no impediment to a bridge at this point being level with the connecting roadways, and still affording ample headway underneath, nor to its being at least double the present width; but the proposed or any modifications would be at least but "cobbling up" the old structure without attaining the desired ends in their entirety, and better that it remain as it is until the citizens are prepared to take it down and rebuild it *in toto*, to meet in a suitable manner growing requirements. We trust the day may not be far distant when the traffic will be relieved by a suspension bridge, with swivel opening, spanning the river at the Custom-house, and connecting the extreme north with the extreme south of the city by a few minutes' journey. Portobello and Charlemont-bridges at one side, and Newcomen and Annesley at the other, are objects of ridicule for visitors to the city, and productive of much inconvenience to the inhabitants generally. For the two former might, with facility, and at comparatively trifling cost, be substituted permanent iron structures, affording better headway than the present, and necessitating but a very slight altitude (if any) above the road levels. At Newcomen-bridge an important modification must take place immediately, owing to the construction of the Liffey branch railway, in which matter we trust that the corporate and railway authorities will work hand in hand in producing a result offering additional facility to public traffic, and thereby enhancing the value of property so much deteriorated of late years at the north side. Let us in the name of common sense ask the meaning and utility of Annesley-bridge? An ordinary culvert of a few feet in width would be ample to convey the stream that now flows at any time underneath; but even without removal, the roadway may easily be lowered from three to four feet—a consummation devoutly to be wished for—and in the ardent desire for speedy accomplishment we are sure to be joined by the proprietors of various vehicles plying on the Clontarf road. At Sheriff-street an important alteration for the better will now take place. The railroad above alluded to, was originally intended to cross that street five feet below the level of roadway, which latter was to be carried over the former by a new stone bridge, and a steep incline (1 in 25), commencing near St. Laurence O'Toole's Roman Catholic church, and equidistant at the other side. However, a level crossing and swivel or pontoon bridge are now decided to be substituted, although the matter was a *quæstio vexata*, and evoked much argument before the preamble was proved.

If our sanitary arrangements require to be remodelled, our pavements more permanently and economically constucted, our water supply more efficiently provided for (subjects already treated of in the DUBLIN BUILDER), our bridges demand the immediate attention of the well-wishers for the progress of the second city in her Majesty's kingdom.

PROGRESS OF ECCLESIASTICAL ARCHITECTURE.

FEW countries in the wide circle of European civilization were more deficient in the character of their edifices for the worship of THE MOST HIGH than Ireland until very recently. We are proud, however, to notice that not only is there a marked improvement, but that before the lapse of many years she will stand pre-eminent amongst the nations of Europe in the grandeur of her Ecclesiastical buildings for every sect and persuasion. In the metropolis and neighbourhood the works of this class now either actually in progress or about to be commenced are of an important character, and will form, when completed, valuable addenda to her many beautiful buildings. *Par example*, the Church of St. Saviour in Lower Dominick-street, is, perhaps, one of the most elaborate Gothic edifices of modern times erected either here or elsewhere, whether we regard it exteriorly with its deeply splayed and moulded doorway, its highly decorated canopied and niched screen work, its great east and west windows, with rich tracery, its crocketed pinnacles and buttresses, and lastly, its noble tower and spire to be elevated to a height of some 200 feet, and adding one to the few landmarks our city can boast of; or internally, with its gracefully proportioned vaulted nave and aisles, its decorative ceiling and tiers of clerestory windows diffusing a subdued and hallowed light, and guiding, as it were, the aspirations of its inmates.

The Roman Catholic church of St. Catherine's, Meath-street, and both the Roman Catholic and Protestant churches (the latter recently commenced) of St. James in James's-street, are likewise architectural acquisitions, and it is to be hoped that the incomplete portions will be speedily finished. At the south side the new Molyneux church to be built in Leeson-street, will be an important structure with towers and spire, and will cost some £12,000 or more, and at Rathgar the Zion

Church, now about to be commenced, will be an interesting feature in that rising and populous neighbourhood. All through Ireland, for at least three years, it is a noticeable fact that the majority of buildings, either projected or commenced, have been of an Ecclesias- or Conventual character, and the operations of the Ecclesiastical Commissioners have been unusually active.

Perhaps one of the most conclusive evidences of the growing prosperity of Ireland is the progress of her Ecclesiastical architecture, for in times when famine and pestilence prevailed there were numerous districts in which the devout were gathered together in structures, ruinous, mean, and unsuitable for the worship of the Most High, in some instances in barns and cow-houses, and in others in what bore the name of churches, where the congregation was huddled together, and possibly one-third remained under the open canopy of heaven, in all seasons, and left to draw upon their imagination for the proceedings interiorly. This state of things, however, is being gradually remedied—former buildings are being improved and enlarged to suit growing requirements; new edifices of a permanent and substantial character are being erected throughout the length and breadth of the land in neighbourhoods where an officiating clergyman was only to be found in a circumference of some ten or twelve miles, and "for a paltry pittance of some few pounds a-year" had to travel long distances from place to place to preach the Holy Gospel and minister to his flock. Our old and venerable Cathedrals are being saved from threatened ruin, and new ones are being raised to vie in beauty and grandeur with their predecessors. Gothic architecture especially takes the lead, and though under that title a few very "Gothic" structures may be found—and will serve as lasting memorials of the folly of not securing *ab initio* proper professional skill—yet, in the total, improvement is manifest, and the proceedings thus far augur PROGRESS.

ARCHITECTURAL NOTES IN BELFAST.

THE NEW BANK OF IRELAND.

FEW places can boast of more rapid improvement than the town of Belfast, which possesses many splendid structures of an official, commercial, and domestic class, notwithstanding the serious impediments offered to building enterprises by the difficulty of procuring suitable foundations. In some of the towns of Holland, artificial foundations, by piling especially, are to such an extent necessary that the inhabitants are said "to live like crows upon the tops of trees, and the remark is peculiarly applicable to the subject of this notice. In previous Nos. of "THE DUBLIN BUILDER," we had occasion to comment specially on the sanitary state of the town, arising chiefly from defective sewerage; and when we repeat that "the greater part of the streets are only raised a few feet above high water level, some on the *same level*, and others even *below that level*," a peculiar feature in the construction of buildings there, or the almost total absence of basement storeys is easily accounted for, as also is the difficulty of providing sufficiently secure footings in a naturally wet and swampy soil. Some of the houses have sunk to such an extent that in those originally approached from the street level by four or five steps, only two or three are now visible, and in other instances light return buildings attached to heavier structures still maintain their position while the latter have separated themselves from their companions, and sought more intimate acquaintance with "mother earth." The provision of artificial foundation for any new work, therefore, occupies the special attention of the architect, as also does the requisite outlay form a very important item in the builder's estimate. Some large stores have of late been erected wherein the ordinary system of piling was dispensed with, and a heavy cradling of baulk timber substituted, and designedly constructed to allow the main building to sink regularly, while the light work of yard walls, iron railing, steps, &c., are made good from time to time, in the hope of all ultimately maintaining a fixed position at a desired level. Nevertheless these difficulties have been to a certain extent overcome, and Belfast does not, in an architectural point of view, suffer by comparison with any other town of equal magnitude in the kingdom.

Amongst the many buildings now in course of erection in Belfast, the new Bank of Ireland in Donegal-place is one of the most important, and has already attained a height exceeding 20 feet over the street line. Although fully a quarter of a mile's distance from the water side, it was found necessary to employ in the foundations 420 piles of home-grown larch, each 40 feet long, and 14 inches diameter at the head, tapering to 6 inches at the foot, set in two rows under the walls, and having a cradling of cross and longitudinal pieces of memel, with a course of Portland cement concrete, averaging 8 feet 6 inches width, and 2 feet 6 inches height, thereon to receive the first course of the footings. Forty feet piles are then driven by a ram of 16 cwt., requiring the aid of seven men who, in less than three hours, set up the pile and send it to its destiny by about 60 strokes, it at first entering the ground on an average of three feet each below; and when near the full depth three inches.

The superstructure is of Paladian character, extending sixty feet in front, and having three storeys of an excellent specimen of Newry granite, with porch, corni e, ballustrade and architraves in Portland stone, the remainder being wholly of brick, and having yard and return building, containing porters' apartments. The cash office is in the form of a blunt cross, about 40 feet each way with a lantern at the intersection; and all the fittings are of mahogany. A fireproof safe of brick and cement is provided for the books, as also for the cash, the latter, having in addition a thorough lining of ⅜ inch boiler plate iron, with detached lockers inside. Apartments are provided for the sub-agent in the second and third story, where are also placed the kitchen and larder, &c., owing to the distance from the rere and the impracticality of a basement story. The work is being executed by Messrs. D. and J. Fulton, from the designs of Mr. S. Symes, architect to the Bank of Ireland; Mr. R. O'Brien, being the clerk of works. We understand that the total outlay will be upwards of £7,500.

AMONG THE TOMBS—GANDON'S GRAVE.

IF there be one thing more suggestive than another of varied thoughts, feelings, and emotions, it is a visit to an old church-yard. There they lie, as we too shall, in their last resting-place, the once stout of heart and strong of limb, the loved, and the beloved, the village bravo, and the village belle, of whom no mementos now exist, save what the crumbling slab above them tells, and for whom no tears now fall, save betimes the "drip of the wetted trees." Oh, Drumcondra! turn we then to thy hallowed shade, thou dear custodian of those whom our fathers loved. Time may moulder into dust what the worm could not fatten on, but thy memories she can never obliterate. Many generations have ebbed and flowed since the first sent thither "shuffled off his mortal coil." Many a palesman found a grave neath your cypress and sycamore ere the Dutchman came and the wild geese flew; the Boyne was an unfought field, and Sarsfield's expatriation undreamt of, when a citizen widow knelt here o'er a husband's grave. The city sent its merchants and mechanics, and they slumber here side by side in suburban quietude.

A century and a-half later, loyalist leader and rebel chief mingled in the one clay. Here, too, after many vicissitudes and hair-breadth escapes, the Royalist, who stood by the fortunes of the Bourbon till hope seemed hopeless, found a grave, after first finding an asylum far from the land he loved. Alas! too, lying low amidst the names of later days, are the tombs of two worthies—Grose and Gandon—the antiquary and the architect. Tombs! did I say? The one suffices for both. "Friends through life, in death undivided." "O tempora, O mores!" and is it not painful to witness to-day, nearly forty years after the great architect's death, him who designed, enriched, and embellished our public buildings should remain unmonumented in a rural churchyard close by the city. The stranger in search of Gandon's grave will be doomed to disappointment, unless previously informed of his whereabouts; he may give up a painful search. The flat slab above the antiquary has had ample space wherein to notify that James Gandon's remains, likewise, lay below; but this public duty—lack of public spirit, even in the city of his triumphs—has failed to do for him. Shall it be so? Pass we on—a few paces further to the right of the above graves is the monument of the poet Furlong, the translator of Carolan's Remains; the "Misanthrope," and the "Doom of Derinzy"—a somewhat tasteful granite structure erected by his friend Hardiman, the historian, of Galway, who had a public spirit; peace be to spirit, and to all like him who can appreciate deserving genius!

C. C. H—Y.

OLD CONNAUGHT, BRAY.

We notice that in this locality a mansion of considerable architectural beauty and importance is now nearly completed for Phineas Ryall, Esq., from designs by Messrs. Lanyon and Lynn, architects, Belfast. Considering the general character of our recently erected suburban domestic dwellings, a view of this recalls to our minds "the good old times," when Irish gentlemen built palaces and *made them their homes*, and when architectural skill was called into requisition beyond mere stereotyped brick and mortar forms. The professional gentlemen engaged here have availed themselves largely of the opportunity afforded, and produced a design which in picturesqueness of effect, pleasing variety of light and shade, gracefulness of contour, and all the other requisites for a good architectural work, fairly entitle it to rank with the most successful productions of a Morrison, a Gandon, or a Johnston. The mansion occupies an area of about 88 feet by 64 feet, and is of early English character, built externally of irregular granite rubble, with Portland stone dressings, string and barge courses, water tables, &c. The principal front presents an irregular elevation, broken by a wide projecting gable, beyond whose face the entrance porch still further advances, by a handsome bay window, with ornamental parapet; by gablets, oriel windows, and two towers, one of octagonal form—situated internally, communicating with principal staircase, and terminated by a deeply weathered conical top, rising to a height of 80 feet—and another of square form, and 50 feet high, externally placed, and forming a junction between the main and minor buildings. The windows throughout are generally many light bays, with mullions and transom heads, and are finished with label mouldings, dressings, &c. Internally the house comprises all the apartments requisite for a building of its class, including grand hall, morning, drawing, dining, and ante-rooms, own and housekeeper's apartments on principal story; comprehensive culinary offices, servants rooms, storeys, &c., in the basement; and bed-rooms of various sizes, bath and dressing-rooms, &c., &c., in the first floor. The principal hall is a very handsome apartment, 28 feet by 20 feet, with an ornamental frieze course, and open panelled and decorated timber ceiling, stained and varnished; and a highly enriched moveable screen work carried up, as also is the wainscotting all round to a height of 9 feet. The works throughout reflect great credit on the builders, Messrs. Cockburn and Son.

PUBLIC FOUNTAINS IN DUBLIN IN 1785 AND 1859.

We find that during the Viceroyalty of the late Duke of Rutland there were many public fountains placed in the metropolis, by which the wants of the humbler classes, and the taste and refinement of the more educated were benevolently and felicitously consulted, some of them very beautiful, surmounted in most instances with casts from the best statues of the antique. There are but two now remaining, and both much dilapidated, one in Merrion-square, the other in Barrack-street; this latter one is dated 1785.

Do our recent structures of this class stand the test of comparison with those of our forefathers? Compare the "slab" on Carlisle-bridge with the above-named, and what a degeneracy both in taste and regard for utility! *O Tempora! O Mores!*

SANITARY REGULATIONS FOR LODGING-HOUSES IN BELFAST.

Apropos to our remarks at page 84 of the "Dublin Builder," and which have elicited much comment (though *no denial* as to the accuracy of the statements) we are requested to mention in justice to the authorities that the sanitary regulations to be observed by the keepers of lodging-houses are peculiarly stringent. We do so with pleasure, and while it is our duty to expose defects, it is equally our desire to chronicle any advancing steps to ensure general cleanliness and purity of dwellings, and which, however partial, must ultimately tend to the health and well being of the community. During this year, 184 common lodging-house keepers within the town have been licensed, and the powers for the regulation of that class of dwellings are derived from the Belfast Towns Improvement Act, sections 207, 8, and 9. We extract the following from the printed regulations:—

The licence shall set forth the number of persons, beyond the members of the family, which can be properly received into such house, and the owners shall not take any beyond that number under a penalty of 40s. for every breach of this regulation. 2. In every room, of every lodging-house, a card shall be hung up, shewing the number of individuals such room can legally accommodate, and none beyond that number shall, on any account, be put therein. 3. Every day, the windows in the sleeping apartments of all lodging-houses shall be opened to admit fresh air, and the beds and bedding therein shall be, for some hours, spread out; and every such room shall have proper means for due ventilation, which shall be observed night and day. 4. Twice in each week the floors of every lodging-house shall be properly scrubbed and cleansed, and the strictest attention to cleanliness, at all times, shall be observed, the beds and bedding to be kept clean, dry, and wholesome. 5. Once in every quarter, in the months of January, April, July, and October, in each year, all lodging-houses shall be duly cleansed and whitewashed inside, by the person keeping such; and the beds and bedding therein shall be, at the same periods, thoroughly cleansed and purified. 6. In case of sickness occurring in any lodging-house, the keeper thereof shall immediately give notice to the inspector of lodging-houses, that prompt steps may be taken, and precautions used, to prevent the spread of infectious or contagious disease; and in every case, when disease of an infectious or contagious character has appeared in any lodging-house, the apartments where the disease has appeared shall be cleansed, and the bedding therein shall be duly purified, before any other person shall be permitted to sleep therein.

PHILANTHROPY AND DRINKING FOUNTAINS.

It will scarcely be believed by some what we now record as a fact—viz., that the proprietor of a dram and beer-shop in this city has, at his own expense, and immediately adjoining his establishment, erected a public drinking-fountain—equal, in point of utility at least, to any other as yet fixed here—thereby contributing gratuitously *aqua pura* to those who would seek *alcohol* for payment, and thereby, at least partially, intercepting their progress to his counter, and inflicting a voluntary penalty on himself. This is practising self-denial without preaching it!

ARCHITECTS' LIABILITIES IN ORDERING MATERIALS.

A case was tried at recent assizes in Limerick, wherein the plaintiff, Mr. Nagle, a local architect and civil engineer, sought to recover from Mr. Dalzell, a farmer in the county, for whom he was superintending some building works, a sum of £31, paid by plaintiff for timber for defendant's use. The party who supplied the timber did so at the order of the architect, and when he sought for payment from the defendant, defendant pleaded "no order," refused to pay, and contended successfully; whereupon the architect was compelled to pay, and proceeded against his client, the jury giving him a verdict for full amount and costs. There is a salutary lesson to be derived from this transaction.

THE MASTER OF THE ROLLS AND PHOTOGRAPHERS.

In the case of Ernest Gambail against Messrs. Bewley and Evans, an injunction was granted to the petitioner, who carries on business at 25, Berner-street, Oxford-street, London, and in Paris, as a purchaser of pictures, and publisher of engravings, to restrain the respondents, who are chemists in Dublin, from taking and selling photographs of petitioner's copyright pictures of "The Departure, second-class." "The Return, first-class;" "The Horse Fair" (Rosa Bonheur); "It is I, be not afraid," &c. The respondents pleaded ignorance of illegality of the act, but the Master said, "A man, who picked a gentleman's pocket, might as well say that he did not know the act was contrary to law, and that he desisted when he became convinced of the fact. Injunction granted.

MUSIC AND THE DRAMA.

It is announced that an Italian operatic troupe of considerable excellence is to appear on the 6th instant at the Theatre Royal, and comprising Mdlles. Titiens, Guarducci, and Vaneri; Signor Guiglini, Badiali, Vialetti, Castelli, Rossi, Corsi, Borchardt, and Mercuriali. We doubt not that the enterprise of the manager will be amply rewarded by the substantial appreciation of the public. At the Queen's Royal Theatre an old favourite, Mr. T. C. King, tragedian, after a long absence from indisposition, has been attracting crowded houses, and Miss H. Gordon and Mr. G. Honey have been adding to their previous popularity.

Railway Extension to Bantry.—There are now two projects in contemplation for the extension of railway communication to the west of this county. A meeting is convened for Thursday, upon requisition by Lord Fermoy, to consider a proposition to be submitted to Mr. Conybeare, C.E., for a railway to Bantry, with a branch to Skibbereen. It is said that in the absence of Lord Fermoy the Right Hon. the Earl of Bandon will preside at the meeting. A line, which was projected in 1853, is also about to be revived, the extension of the Bandon line to Bantry, with branches to Clonakilty and Skibbereen. It is, however, believed that but one of the projects, if either, will apply for parliamentary powers.—*Cork Constitution.*

Biographical Sketches.

JAMES GANDON.*

MUCH factious opposition was raised to the removal of the old Custom House from its then situation (which immediately adjoined Essex-bridge, the principal entrance being in Essex-street and Temple-bar, and a side entrance at the bridge, descending by a flight of stone steps), owing to a supposed innovation upon the commerce of the city; hence the arrival of the architect to superintend the building was necessarily kept a profound secret; and he felt very uncomfortable about his late move from London, where he enjoyed an eminent professional position, as may be inferred from the following entry in his Diary:—"I found myself in a very unpleasant state of suspense, apprehending that the abruptness of my departure from my family and establishment in London might injure my character, and, should my visit to Ireland prove unsuccessful, endanger my professional pursuits at home." At this period, it is stated that there was but *one* printshop in Dublin, and *two* others where prints were sold, but the trade of the owners was that of glaziers. There were few painters of eminence, and but two architects, professedly so called. The painters were Wheatley and Hone in portrait, Ashford and Fisher in landscape. The architects of reputation were Cooley and Ivory. Few churches showed anything like attempt at style, and only two of them had steeples, viz., St. Patrick's and St. Werburgh's (the latter since taken down); and there were no halls belonging to public companies; and, with the exception of the Duke of Leinster's, the Marquis of Waterford's, the Earl of Charlemont's, and Viscount Powerscourt's, there were scarcely any other residences of nobility. The houses of the gentry were generally inconvenient in their plans, having, in most cases, but two rooms on a floor, and these adapted for large parties; and as to architectural style in embellishment and finish, they were very imperfect. Difficulties arose respecting the terms for the ground on which the new docks and stores adjoining the Custom House were to be erected; hence the unavoidable interruption to the works, and "the kind of imprisonment," as our architect terms it, to which he was subjected. While in this predicament, Mr. Gandon received an invitation from the Right Hon. Burton Conyngham to pass some time with him at Slane, which he accepted, and regarded as a relief from his temporary embarrassment. After three months, the negotiations for the purchase of the grounds were completed, and the architect received orders to proceed with activity. On the 8th of August, 1781, the first stone was laid by the Right Hon. John Beresford, without any formality, for fear of riot. Owing to the swampy nature of the site, considerable precautions had to be taken in preparing the foundations; but the work proceeded successfully and with rapidity. After interruptions had subsided, the east wing was pushed forward; and at this stage of the works, the architect was summoned to London to attend the death-bed of his wife. On his return, the north and south fronts were commenced; and in digging the trenches for the latter, the labourers came upon a boiling spring, with sand, at about four feet below the surface, which filled up as fast as it was cast out; but ultimately, by the aid of piling, pumping, and sodding, and a constant relay of masons, a solid foundation was obtained, and the entire structure progressed rapidly. New lines of streets, squares, &c,, including Beresford-place, Gardiner-street, Mountjoy-square, the line from Carlisle-bridge to Phibsborough in one direction, and a considerable portion of the North Circular road, as far as Annesley-bridge, were commenced. Ground was at that time purchaseable by the acre, at a mere nominal rent; and was then nearly all a swamp. Mr. Gandon occupied a house in Mecklinburgh-street, since pulled down to open Mabbot-street into Gloucester-street; and it was there that the celebrated Misses Gunning were born, whom Sir Robert Walpole describes in his Anecdotes.

About this period (1783), Mr. Gandon made designs for a united court-house and gaols in Waterford; and he says that in these buildings he experienced more vexation and trouble than with any of the public works submitted to his superintendence, owing to the artificers not being regularly paid; and in his interview with the Grand Juries he found "that these gentlemen had a very erroneous idea of the profession of an architect, as it stood in England." Some of them considered him as a contractor, or, as they termed him, "a projector and undertaker," not one of those sable personages whose occupation it is to bury the dead, but to bury stones and mortar.

The models, by Banks and Carlini, for the figures for the Custom House, Dublin, arrived about 1786, and were soon after carved and sent over; and for the ornamental sculpture, the architect inquired of Mr. Henry Darley, then engaged on the works, and who employed many marble sculptors, to introduce him to a modeller, and the eminent artist Mr. Edward Smith (who executed the statue of Doctor Lucas, in the Exchange) was engaged accordingly; and his design for the royal arms on the wings was adopted in preference to Carlini's model. Thus was the humble drudge in a workshop enabled to enter his own studio, and subsequently become the Phidias of Ireland. The colossal statue of Commerce, the bas-relief in the pediment of the key-stones, representing the principal rivers in Ireland, are by this artist.

The repeal of Poyning's law, which removed the appeals from the English to the Irish House of Lords, rendered increased accommodation to the Houses of Parliament necessary; and Mr. Gandon was applied to, who suggested an eastern Corinthian portico as an entrance to the Lords, connected with south front by a circular ornamental wall, but *not*, as executed, with the three-quarter columns. The portico was approached by two steps, and the rusticated and niched wall was executed, but without any columns. The original dome was destroyed accidentally by fire, owing to the overheating of a smoke-tube. New courts of law were next projected, and Mr. Gandon furnished designs. The west and south quadrangular portions of the new Four Courts, or, as they were then termed, the "Offices of Records," were originally designed by Mr. Cooley; and, in October, 1776, the first stone of the east wing was laid by the then Lord Lieutenant, the Earl of Harcourt; but the central building and connecting gateways were from the designs of Mr. Gandon; and the first stone was laid by the Duke of Rutland, on the 3rd of March, 1786, accompanied by the Lord Chancellor Lifford and the judges in state. Serious obstacles arose here, also, and considerably retarded the progress of this beautiful work, both from the opposition raised by private interested individuals, and the slowness and pettiness of the grants of necessary funds.

In January, 1788, Mr. Gandon was summoned to appear at the bar of the House of Commons, to explain the plans and estimates, although, strange to say, at that period upwards of £12,000 had actually been expended; however, he states that "he was only called upon by the Speaker to present the papers at the bar, and no questions being asked, he withdrew." Several objections were raised in the House to the erection of this building, one of which was, "that, as the army passed by every day from the barracks to the Castle, the fifes and drums would disturb the Courts;" to which it was replied, "that in the summer, to avoid the sun, they frequently went on the opposite side of the river, which, if found necessary, they might be directed to do in future." Such, and other factious objections, so disgusted the architect, that he did not like to go near the works, and prevented him from constructing the inner dome with brick, which, for the sake of expedition, and to save expense, was done with carpentry.

In a report submitted to the Lord Chancellor and judges by the architect, in 1794, we find the following items:—

Expended on the Courts	£44,234
Wanted to complete same	15,898

It was not until 1798 that the foundations for the east wing were laid, nor until 1802 that the screen arcade and wings of offices were completed.

In 1786, Mr. Gandon made some sketches for a military hospital at Phœnix Park, and presented them gratuitously to the institution. The present elevation of the Infirmary is in most respects according to those designs. The original design submitted by Mr. Gandon for Carlisle-bridge was for a triumphal bridge, to commemorate the army and navy achievements during the reign of George III.; but the design as executed was subsequently adopted, and the first stone laid on 5th March, 1791. The key-stones are ornamented with emblematical heads, by Edward Smith. The last public building which Mr. Gandon designed and conducted was the King's Inns, the first stone of which was laid by Lord Chancellor Clare, on the 1st of August, 1795. The Caryatic figures and other ornaments are by Mr. Smith. In the year 1797, Mr. Gandon was elected a Fellow of the Antiquarian Society of London, and had previously been elected a Royal Irish Academician.

---

* See page 79.

In 1798, previous to the Rebellion, a friend warned Mr. Gandon to leave Ireland, lest he should, from his liberal feelings, be implicated in impending events; and he accordingly returned to London until 1799. With his engagement as architect of the King's Inns may be regarded the close of Mr. Gandon's professional career of nearly sixty years; for we find that in 1808, considering retirement and ease necessary for his health, he tendered his resignation to the then Lord Chancellor Redesdale, and recommended the late Henry A. Baker, R.H.A., to succeed him.

The works erected under his superintendence were, the court houses and prisons of Nottingham and Waterford, Custom House, docks, stores, Four Courts, Carlisle-bridge, King's Inns, portico in Westmoreland-street, Dublin, besides a variety of buildings of a domestic character.

Mr. Gandon retired to his villa at Lucan, where even in his old age he composed designs for villas, &c., projected triumphal arches—one intended for the entrance at Barrack-street to the Phœnix Park, and another in London to commemorate the recent successes of the British army and navy, until at last his master mind was withdrawn from its earthly tenement, in the eighty-second year of his age, the immediate cause of death being gout. Mr. Gandon left one son and two daughters; and the probate of his will was proved under £14,000. His remains were interred in the churchyard at Drumcondra, in the grave with his bosom friend Grose.

DUBLIN CORPORATION WATER WORKS.

At a time when so much interest is felt respecting a supply of water to the city—which lately had proved well nigh fatally defective—and for the information of those who have not had access to the documents laid by professional referees before the Corporation Committee, we publish *in extenso* in this number the Reports of Mr. Hawksley, C.E., the Consulting Engineer, to whom the various projects had been submitted.

No. 1.

After a full examination of all the questions involved in the determination of the most feasible means of supplying the City of Dublin and its vicinity with water on the improved sytem of constant supply at high pressure, I come to the following definite conclusions, which I submit for your consideration.

1st.—That if reasonable, satisfactory, and prompt arrangements can be effected with the Canal Companies on the basis of your communications to them of the 24th August last, and on the terms of my last letter, it will be more advisable to derive the supply of water from the Canals than from any other of the many sources which have been alternatively suggested. Indeed, the majority of the gentlemen who have submitted plans to the Corporation for effecting an improved supply, appear to concur in the view I have adopted.

2nd.—That the quantity of water proposed to be afforded by the Canal Companies—viz., six million gallons per diem by the Grand Canal Company, and four million gallons per diem by the Royal Canal Company—will be ample for the domestic and sanitary purposes of a population of four hundred thousand persons, being one-half more than the existing population of Dublin and its neighbourhood. This provision is consistent with ordinary parliamentary usage.

3rd.—That the additional quantity of three million gallons obtainable from the Dodder district at the Kimmage Tongue, will be sufficient for the supply of traders and manufacturers.

4th.—That as the improved scheme ought to embrace within its capability as much as practicable of all the populous districts adjacent to the Municipality, as is the case in the instances of Liverpool, Manchester, Leeds, Glasgow, and many other corporate cities and towns, it will be necessary to obtain for the Southern districts a pressure available for day service of about 150 feet, and a commanding pressure available for night service of about 180 feet, in order to insure the filling of cisterns in the upper apartments of elevated houses, and the immediate extinction of fire by the more simple means of the hose-pipe and jet. In the districts north of the river a pressure of somewhat lower amount will meet the necessities of the case. The point upon the Grand Canal (suggested by the Chairman of the Company) near Clondalkin, and above the 11th Lock, is in all respects eligible for the derivation of the supply, and inasmuch as the ground immediately adjacent is favourable for the construction of a Service Reservoir capable of containing, with a maximum depth of about twelve feet, the quantity of sixty million gallons of water required as a provision for the wants of the community during any brobable period of stoppage for the purpose of repairing the Canal. I beg to recommend the Committee to adopt this as the source of supply for the Western districts. The top water-level of the Reservoir thus placed will be an elevation of about 210 feet above Ordnance datum, and immediately below this Reservoir filter-beds ought to be constructed, for the purpose of rendering the water perfectly bright and potable, by the removal of all extraneous and adventitious matters. These filter-beds will operate on water essentially colourless, and should, therefore, be constructed of sand and gravel only. The area of the surface of sand necessary to effect the perfect purification of the water need not exceed two and a-half statute acres, divided into five beds of half an acre each. The pure water should be received into a tank capable of containing three million of gallons, and from this tank a cast-iron main-pipe of thirty-six inches internal diameter should be laid down to convey the water to the city. For parliamentary purposes it is however, only necessary to consider this pipe as having its termination just within the parliamentary boundary at Dolphin's Barn, where the distribution would practically commence.

5th.—That for the North side of the City it appears to me that the most desirable point for obtaining the supply to be afforded by the Royal Canal Company, is the east end of the long pond above the 12th Lock, where the water of the Canal attains a level of 195 feet above the Ordnance datum. The works to be made in connection with this Canal would all be of two-thirds the capacity of those already described. Land suitable for the construction of a Reservoir capable of containing forty million gallons of water is apparently to be found between Ranelagh Bridge and Morgan's Schools, and if I am correct in my view the top water-level will be about 190 feet above datum, and the bottom water-level, which would also be the level of the filter-beds, would be about 170 feet above datum. From the pure water tank connected with these Reservoirs, a main pipe of thirty inches diameter should be carried to the municipal boundary at the top of Prussia-street.

6th.—From the foregoing description of the very simple and effective works which I have now the honour to recommend to the consideration of the Committee, it will appear evident that the expense of construction and management must be materially less than those which would be consequent upon an endeavour to utilize equal quantities of the waters of any of the montain ranges in the counties of Dublin and Wicklow, and it is quite certain that if an arrangement can be effected with the Canal Companies for the purchase of their rights in the stated quantities of water for the sum of £2.500 per annum (equal at four per cent. to an outlay of £60,000), that this amount is not more than equivalent to the cost of compensating the millowners whose interests would be effected, either in money, or in water to be accumulated from floods by means of large Reservoirs and other works to be constructed for that purpose. Apart from the consideration of mere pecuniary advantages, fewer parliamentary and municipal difficulties would have to be encountered, and there would also be less distrust as to the ultimate success of the measure, and the feeling of the public in regard to the quality of the water.

7th.—I estimate the cost of the now suggested works, including the purchase of land and contingencies, at the sum of £122,000, and I calculate the expiense of connecting the proposed thirty-six inch and thirty inch mains to the existing system of pipes, and of eventually establishing a communication of large size between the two sides of the river at the further sam of £15,000.

8th.—The improved works would necessitate an additional expenditure in payment of interest, amounting to about £6,000 per annum; but they would produce a return of certainly more than £10,000 per annum from districts not included in the present system of distribution, and from new applications of water under the improved system. It is, therefore, obvious that no considerable burden will be imposed upon the inhabitants in return for the great advantages to be derived from a constant supply at high pressure of waters, which in their future quality will not sensibly differ from the waters of Lough Owel, and the springs and other unobjectionable sources by which the channels of the Canals are daily replenished.

9th.—I am of opinion that the next most economical source from which a sufficient supply of water can be procuredis to be found at Kippure, near the head of the River Liffey. The mountain water can here be collected into capacious storage Reservoirs; but I entertain much doubt, whether the large works necessary for supply of the City, and for affording commensurate compensation to the mill-owners whose waters would in part be abstracted, could be made for a less sum than from £230,000 to £250,000. If made, these works would necessitate a larger annual expenditure than those suggested to be constructed in connection with the Canals.

10th.—In conclusion, I may remark, that as your resolution does not require me to report on the various able propositions into the respective merits of which I have carefully examined, I abstain from so doing; but I do not think I should be acting with justice to the gentlemen by whom they were originated if I did not recall to your recollection that Mr. Louch, Mr. Hassard, Mr. Neville, and Mr. Mulvany, have each separately proposed that the future supply should be obtained in an improved manner from one or other of the Canals, and some of these gentlemen from both. Mr. Hassard has also suggested as an alternative scheme the employment of the beautiful waters of the River Vartry and other adjacent districts, but at a cost which that gentleman admits to have placed these (otherwise the best sources) beyond the reach of the community. Mr. Brazill has proposed the River Liffey, near Poulaphuca Bridge, as an available source; and Mr. Mallet, who projected a scheme on the Dodder for the use of the millowners, concurs in the appropriation of the Canals.

No. 2.

I have considered the Report (dated December 3rd, 1858) of the City Engineer, in relation to a suggested scheme for acquiring the whole stream of the City Water Course, and by combining this with other water to be derived from the Grand Canal, to enable the City of Dublin and its vicinity to be adequately supplied without having recourse to the water of the Royal Canal, as had been previously proposed, and in obedience to your resolution beg to report my opinions as follow:—

1st.—I am satisfied that a quantity of water equal to from eleven to twelve million gallons per diem may be depended upon from these two sources, and that with moderately judicious management this quantity will be found to be sufficient to afford an ample and constant supply at high pressure, even to a possible future population of 400,000 persons. Liverpool, Manchester, Leeds, and many other principal towns of the United Kingdom, into which the constant supply at high pressure has been introduced, do not consume so large an amount per head of the population as I have calculated upon, in making this estimate of the future consumption of Dublin.

2nd.—The water of the River Dodder is unquestionably of very superior quality in all respects, except its liability to be occasionally coloured at its mountain source by peat, heather, fern, and other like vegetable matters. I have, however, no doubt that this water, after admixture with the limestone water of the Grand Canal, in the large Reservoir proposed by Mr. Neville, in which it would become exposed for a considerable time to the decolourizing influence of light and air, and after undergoing a subsequent slow filtration through a stratum of sand in the proposed filter-beds, would cease to be in any degree objectionable on the ground of its occasional brown tint. In every other particular, and especially in regard to softness, the supply resulting from the combination of the Dodder and Grand Canal waters would be more advantageous to the consumers than the supply derived from the Canal alone.

3rd.—The situation of the proposed Reservoir is exceedingly well adapted for the supply of the City; and its elevation is such as to enable the Reservoir to command the whole of the district. Moreover, the site is, so far as I am able to remember, free from buildings or other expensive property.

4th.—I believe no difficulty will present itself in bringing the water to the Reservoir in the manner suggested that is to say, by the action of gravity in a covered conduit laid with a uniform or nearly uniform fall, from the pond above the 11th Lock of the Grand Canal, to or near to the surface of the ground at Templeogne.

5th.—In the absence of detailed plans and sections, it is manifestly impossible to form any very satisfactory estimate of the cost of the suggested undertaking; but so far as I am enabled to judge from a somewhat exact knowledge of the locality, I come to the conclusion that Mr. Neville's estimate of the expense of works of construction cannot be very wide of the truth.

6th.—It is extremely difficult to estimate the expense of compensating the owners of water privileges by money payments. I know most, and have, I believe, seen all the mills that would be affected by the withdrawal of the water from the existing water-courses, and I am quite sure the proprietors of water power and other water rights would be fully remunerated under Mr. Neville's estimate, for any damage they would sustain; but I have known so many instances of successful exaction in cases of real and alleged injuries to mill property, that I feel indisposed to risk a decided opinion on this important subject, without looking more fully into the matter than the imperfect particulars in my possession afford me the opportunity of doing.

7th.—The abolition of Lord Meath's water-course, and the introduction of an efficient supply of pure water amongst Lord Meath's tenantry, would be eminently beneficial as a measure of social and sanitary improvement.

On the whole, I may state that I consider the suggested undertaking quite feasible in a structural point of view, and capable of effecting all it proposes; but I am, nevertheless, disposed to think it would be wise for the present to consider the outlay which would result from the adoption of this scheme at £150,000.

In conclusion, I may venture to suggest that, in the event of powers being taken to acquire the entire volume of water flowing through the water-courses, that it will be necessary to exercise a strict supervision of the channel of the River Dodder and its tributaries above the point of diversion, in order to prevent the water from becoming fouled or otherwise deteriorated in quality or appearance.

Notes of New Works.

The new coffee and smoking-rooms, baths, &c., recently added to Jury's Hotel, College-green, were under the directions of Mr. E. H. Carson, architect, and executed partly by Mr. Halston, builder, and partly by Mr. Bolton, builder. Expenditure about £1,600.

The church at Sandford, county Dublin, is to be newly fronted and re-roofed in Gothic style, according to designs by Messrs. Lanyon and Lynn, of Belfast, architects. The principal entrance will be through a handsome moulded and arched doorway, with ogee and crocketed hood moulding, and a great window with elaborate tracery over same, and between its head and apex of gable will be a handsome circular window filled with tracery. A turret and spire of peculiar and quaint design, varying in form at each stage, and springing from a buttress, will be attached to south-west angle, and attain an altitude of some eighty feet, terminating in a vane. The new roof will be of open timber-work, stained and varnished, and will, when executed, be uncommonly effective.

The Church of St. Mary at Donnybrook is to be enlarged under directions of the architect to Ecclesiastical Commissioners.

Extensive works are to be executed at the church of Upper Badony, county Tyrone, same architect.

Sundry building works are to be executed at Portobello Barracks, Dublin, as also at Cahir Barracks, Limerick District, by the War Department.

The new Cathedral of St. Patrick's, Armagh, is to be roofed, slated, ceiled, glazed, &c., under the directions of Mr. M'Carthy, architect.

A new Roman Catholic Church is to be built at Lavey, diocese of Kilmore.

The new Church of SS. Mary and Michael at Rathdrum, county Wicklow, will be dedicated on the 8th September.

A new church is to be erected at Taghadoe, near Maynooth, according to plans. &c., by Mr. J. J. M'Carthy, A.R.H.A., architect.

The Earl of Carlingford is having his estate (Belmyra) laid out in building lots, as arranged by Mr. Carson, architect. It is situated within half a-mile of the town of Drumdrana and Railway Station, and contains about 150 acres. It has a gradual fall towards Mount Merrion, commands most extensive sea and mountain views, and the new roads that are about to intersect it will be wide and convenient.

The Lord Mayor, who has built extensively in the neighbourhood of Rathmines, is about erecting two houses on the Charleston road, and also making additions to his own dwelling, Charleston house.

Messrs. Topham and White, of Grafton-street, are making extensive improvements to their establishment, also from designs by Mr. Carson, architect. Mr. Madden, the builder.

The members of the University Rowing Club, Ringsend, are about rebuilding their club-rooms, boat-house, &c., for which drawings have been furnished by Mr. Carson, architect.

Important additions are being made to Lord De Vesci's mansion at Abbeyleix, Queen's County, according to designs by Mr. Digby Wyatt, architect, of London. Messrs. Cockburn, contractors; Mr. Pratt, C.W.

A new mansion, with out-offices, &c., is about being erected at Killishea, Co. Kildare, for —— Moore, Esq. (son of the late Judge Moore). Messrs. Lanyon and Lynn, architects; Messrs. Cockburn & Son, builders. Expenditure, £12,000 Italian style. A lofty, square campanule is introduced, and will command a very extensive view.

The picture gallery at Ormond Castle is to be re-roofed with a very handsome open timber roof, stained and varnished. Messrs. Deane, Son & Woodward, architects.

Considerable additions are being made to Lord Charlemont's mansion, between Newry and Dundalk. Italian style. A lofty tower has been introduced. Messrs. Lanyon & Lynn, architects.

Additions, consisting of two aisles and a tower and spire, have been made to the Congregational Church, Kingstown. Mr. Raffles Brown, architect; Messrs. Cockburn & Son, builders.

Messrs. Todd, Burns & Co. are entering into contracts for large additions to their monster house in Mary-street. Mr. Gribbon, architect.

BUILDING MEMORANDA.

Extensive additions and alterations are to be made at Derry Cathedral, under the direction of the architect to Ecclesiastical Commissioners; as also is the rebuilding of the church of Killany, county Monaghan; the enlargement of the churches of Knocknamuckly, county Down; and Donahendry (Stewardstown), Drumnakilly, county Tyrone; and the refitting of St. Anne's, in the city of Dublin; Leixlip, in same county, and Ballymoney, county Antrim.

LAW NOTE AT RECENT ASSIZES IN TULLAMORE.

Hubert Healy v. Allan Pollock.—An action was brought to recover a sum of £327 16s. 7d. for work and labour, materials furnished, and goods sold and delivered. The plaintiff is a stone mason and builder, and the defendant a Scotch gentleman who is an extensive landed proprietor in the west of Ireland. The plaintiff made his claim on foot of building transactions, such as the construction of a farmstead at Ballyhaise, county Galway. The defendant pleaded that the plaintiff's claim amounted to £173 8s. only, and that this had been discharged. The case took the greater part of the day at trial, and ended in a verdict for the defendant. His lordship declined to certify for a special jury.

Reviews.

Monumens Funeraires. Chez D'que Avanzo and Cie, Editeurs Liege, Belgium.

Visitors from the United Kingdom who inspect the cemeteries of Paris and other French cities, are at once struck with the dissimilarity both in point of design and arrangement in the various monumental structures erected there, as compared with those at home; there being greater variety and chastity of taste externally, and greater economy of arrangement internally displayed. The work, as above named, which has just fallen into our hands, contains a series of perfect drawings for suitable memorials to the respected dead, and which in point of beauty and originality of design in the superstructures, embracing all the exquisite delicacy and versatility of artistic touch for which our "volatile neighbours" are so celebrated, and a peculiar adaptation of space internally, is unquestionably in every respect the best book of its class yet submitted to our notice. Some of the principal monuments in the world-famed cemeteries of Pere la Chaise and Mont Martre, as well as many others in provincial towns—a visit to which is fraught with pleasing reminiscences to ourselves personally—are fully illustrated in a most superior style of engraving, the whole, with accompanying descriptive matter, forming a volume of considerable interest, and one which should not be found wanting in the library of any member of the architectural profession, and which, from its very superior excellence, will speedily find its way despite the comparative absence of publicity.

Nicholson's Carpenter's Guide. George Virtue, London, New York, and Dublin.

We need offer no apology for not introducing formally to our readers the author of the work before us, or of indulging in a prefatory inquiry as to his claims for distinction. The name of "Peter Nicholson," as a *practical* author, is as familiar alike to the professional man as to the humblest mechanic, and carries an amount of weight with it which defies criticism from the most experienced reviewer. So many versions, however, of Nicholson's alleged works have, from time to time, found their way into the press, so often have the productions of his pen and compass been pirated from their own legitimate occupation as it were, and mixed up with any useless and unreadable trash merely to make a book look comprehensive to catch the eye of the vulgus, and to secure the *prestige* of tho author's name to matter in some instances of much more recent compilation, that *bona fide* editions of Nicholson have been hitherto very questionable. In the memoir attached to the work before us it is frankly stated—and we admire it for its candour—"that Mr. Nicholson was not an *architect*," and to this admission we presume we may attribute the fact of many very unartistic designs for shop fronts, &c., as illustrated in other works, being omitted in the plates, to our minds very judiciously. Nevertheless the architectural profession throughout the world justly esteems Peter Nicholson as a standard authority in practical matters, and his works indispensable acquisitions to their libraries.

The guide opens with elementary geometrical problems, diagrams of coverings and sections of solids, and thence proceeds to illustrate with accompanying descriptions the various branches of constructive carpentry, including centreings for groins in their many varieties, roofs, domes, niches, truss girders, staircases, and hand railing, columns, partition, volutes, timber bridges, &c., windows and shutters, doors and framing, joisting, &c., &c. This work has successfully achieved its declared purpose, viz., instruction for carpenters in their handicraft; it is concisely compiled; the illustrations intelligible, even to novices, and the whole creditably produced. We have no hesitation in recommending it.

Miscellaneous.

The Portobello Hotel has been taken by the Committee of management of St. Mary's Catholic Asylum for industrious blind, and will, when adapted to its intended purpose, accommodate *one hundred and fifty inmates.*

It is proposed to erect a new and enlarged Roman Catholic Church at Passage.

Zion Church and Schools, Rathgar.—This edifice, now in course of construction, will be one hundred and twenty-eight feet long, and have nave, transepts, chancel, organ, and choir at intersection of transepts, with sloping plots and terraces all round. Boys and girls' schools and teacher's residence are attached at west side. Mr. Welland, architect; Messrs. Cockburn, builders.

Cork and Kinsale Junction Railway.—The first sod has been turned by Colonel Beamish in presence of a large assembly. Messrs. Trowsdell and Co., of Stockton-on-Tees have contracted for its formation, at £4,000 per mile; a very low figure comparatively.

Street Improvements in Belfast.—We understand that, through the kindness of Mr. Joy and the Messrs. M'Clean, the wall, &c., across the entrance to St. Malachy's Chapel, in Henrietta-street, is about to be removed; that Sussex-place will be immediately opened up to Franklin-place, and that Alfred-street and Russell-street will be both continued past St. Malachy's Chapel, for the public accommodation.

A Curious Property of Cast Iron was discovered recently, and that metal has been found to undergo very material internal changes after it has been cast. A large per centage, for instance, of a batch of guns will be found occasionally to burst if tried shortly after their completion; whereas others, similar in all respects, that have been allowed to remain in store for months or years, will stand much heavier charges without injury. It would thus seem that, for a considerable period at least, the component particles of metal undergo a change analogous probably to crystallization, during which their cohesion is increased.

The new statue of Our Lady of France modelled by Mr. Bonassieux, and to be placed on the great rock of the tower of Puy, has just been successfully cast in bronze. It will be nearly as large as the famous colossus at Rhodes.

A company is projected to work on a more extended scale than at present the mineral property of Connorree, at Avoca, in the county Wicklow, and rich in sulphur ore and iron pyrites. The capital is fixed at £50,000, in shares of £1 each.

Pressure of Water.—When a flood occurs in a river the danger to be apprehended is not so much the throwing down of the bridge by the momentum of the water as its being *blown up* by a pressure from below, the resistance which it exerts arising only from the weight and cohesion of its materials. If the water reach nearly as high as the top of the battlement the arch is pressed outwards with a force equal to its surface, multiplied by the depth of its centre of gravity below the centre of the water. If a crevice is formed behind the wall of a canal lock and filled with water, the latter, when the lock is emptied, exerts an outward pressure equal to the product of the surface of that part of the wall behind which it is, and the depth of its centre of gravity below the highest part of the fluid. This may cause the wall to be forced out.

Action of the Iron in Ships on the Needle.—Besides the causes of disturbances which give rise to "dip" and "variation," there is another productive sometimes of serious inconvenienience and consequent on the nature of the material, stores &c., in the ship. To counteract the effect produced by the iron work guns, &c., of a ship, an equal and opposite action by means of a smaller mass of metal near the needle is employed, but be the adjustment ever so perfect it cannot be permanent, since particularly in ships of war the iron must constantly change its place and quantity. The derangement of the needle from this cause is one of the difficulties attending the use of iron ships in navigation.

Power's Statue of "The Greek Slave."—The original statue of "The Greek Slave," the celebrated work of Hiram Power, executed in the purest Carrara marble, has been disposed of by public auction in London. It was executed expressly for its late owner, and was exhibited at the Great Exhibition of 1851, where it gained universal admiration. It was now adjudged to his Grace the Duke of Cleveland at the price of 1,800 guineas.

A new Presbyterian church has been erected at Ballyclare, from designs by Mr. W. T. Matier, C.E., architect, of Belfast.

New Roman Catholic churches are being built at Maghera, also at Raheen, Queen's County, the foundation stone of which latter was laid recently, and that at Tyrrell's Pass is to be completed.

A new National Bank has been erected at Clonmel. It is of Italian character externally, having a rusticated basement, decorated windows, a bold projecting cornice, and surmounted by a parapet. The foundations were laid two years ago; Mr. William Caldbeck, architect; Mr. William Brash, contractor; Mr. John Higgins, clerk of works. The iron work was supplied by Mr. Jacob, Clonmel; the marble chimney-pieces by Mr. Hibson, and the gas-fittings by Mr. Daniel, of Dublin.

IMPROVEMENT IN GAS BURNERS.—Messrs. Defries & Co., the eminent chandelier manufacturers of Houndsditch, London, have just patented a most important improvement in reference to gas, which will no doubt effect a great saving in the consumption of the now universally acknowledged essential material for the production of artificial light. The new apparatus of Messrs. Defries is extremely simple in its construction, and affords great advantages over the modes by which gas is generally produced. The ordinary gas-burner consumes from 11 to 12 cubic feet per hour, at a pressure of twenty-tenths, while the burner of Messrs. Defries in its improved form will scarcely consume 7 feet per hour! The light remains uniform, under all degrees of fluctuation.

NOTICE.

Orders for Subscriptions to, and Advertisements for, THE DUBLIN BUILDER, *will be received at the Proprietors' Office,* 17, LOWER GARDINER-STREET. *Wholesale Agents*—Messrs. W. H. SMITH & SON, *Sackville-street (from whom* "THE DUBLIN BUILDER" *may be had at every Railway Station), and* GEORGE MASON, 24, *D'Olier-street.*

Payments (by Post-office Order or otherwise) for Advertisements in this Journal are to be made to PETER ROE, at the Printing Office, 42, Mabbot-street, Dublin.

Published in London by ATCHLEY & Co., 106, *Great Russell-street, Bedford-square; and to be had in Belfast from* Mr. HENDERSON, *Castle-place.*

We omitted to mention in our notice (last number) of Mr. Tisdall's house, Green-lanes, Clontarf, the names of Mr. William Murray, the architect, and Mr. John Nolan, of Meredyth-place, the builder. As a general rule, however, professional gentlemen, whose names may not reach our ears in the course of inquiry, and consequently do not appear in our descriptions of buildings, must not assume that such omission is wilful; as the columns of the "DUBLIN BUILDER" are always open for the *free* chronicling of improvements, and unexceptionally as regards all parties concerned; and if those interested would kindly take the trouble—as many valued contributors and supporters do—to furnish us with particulars they shall (when within our province) appear as a matter of course.

ENLARGEMENT OF

"THE DUBLIN BUILDER,"

OR

Irish Architectural, Engineering and Mechanics' Journal,

PUBLISHED ON THE FIRST OF EVERY MONTH.

ESTABLISHED JANUARY 1, 1859.

The Proprietor of "THE DUBLIN BUILDER," yielding to the request of many of his valued supporters, and grateful for the unprecedented amount of patronage extended to his Periodical, even in its infancy, has increased the size from

SIXTEEN to TWENTY-FOUR pages, WITHOUT EXTRA CHARGE.

By this means he will be enabled to devote a larger space than heretofore to ADVERTISEMENTS, as well as to Reading Matter, and to secure insertion, without fail, for several favours hitherto unavoidably omitted, in consequence of limited Advertisement space.

The attention of ENGLISH, SCOTCH and IRISH MANUFACTURERS, Machinists, Civil and Mechanical Engineers, Patentees of Inventions applicable to ARCHITECTURAL, ENGINEERING, BUILDING and SANITARY Purposes, &c., &c., is earnestly directed to

"THE DUBLIN BUILDER,"

AS A MOST DESIRABLE ADVERTISING MEDIUM,

Commanding as it does instantaneously and extensively throughout the United Kingdom, but Ireland especially, the numerous classes for whom such Advertisements are intended.

RATES FOR ADVERTISING:—

SIXPENCE each for first three lines, and THREEPENCE for each succeeding line—large type counted double. Double and treble column Advertisements charged proportionately. Discount, varying from 5 to 15 per cent, allowed, according to the length of order.

Accounts furnished Quarterly, unless otherwise specially arranged.

N.B.—APPROVED WOOD BLOCKS OR STEREOTYPES INSERTED.

Yearly Subscription, 3s.; *per post,* 4s. *(payable in advance).*

Communications addressed to the Proprietor and Editor, MR. JOHN J. LYONS, Architect,
17, LOWER GARDINER-STREET, DUBLIN,
Shall receive immediate attention.

TABLE GLASS—FRENCH SHADES—WINDOW GLASS.

TO LARGE DEALERS, or Private Purchasers, requiring the numerous articles coming under those denominations, the Subscriber offers his fully-assorted Stock, the product of Manufacturers FIRST in their respective branches, at Prices not hitherto offered in the Market, meeting the wish and means of all.

JOHN CARRICK,
5, MARY'S-ABBEY,

DEALER IN ROMAN, PORTLAND, AND MASTIC CEMENTS, PLASTER OF PARIS.

N.B.—The attention of Nurserymen, Gardeners, and Amateur Florists is specially directed to the PROPAGATING GLASSES, etc., etc., with which he is constantly supplied.

THE PATENT CRYSTAL WINDOW BARS, adapted for Domestic Windows, Shop Fronts, Conservatories, Skylights, Verandahs, Exhibition and Counter Cases, Aquariums, Fern Cases, etc., etc., combining perfect transmission of light, durability against rust or decay, and economy in the facility with which they are kept clean.

Aquariums with Slate or Marble Bottoms of various sizes, with or without Fountains, also of glass.

Manufactured by LLOYD & SUMMERFIELD, Park Glass-Works, Birmingham.

All kinds of Flint Glass, cut and plain, Coloured Window Sheet, Optical Sheet, Coloured Lenses, etc.

Agents at Dublin—Messrs. SIBTHORPE and SON, CORK-HILL.

Publications.

TO TIMBER MERCHANTS AND BUILDERS.

Now in the press, price 7s. 6d.

THE CALCULATOR; or, TIMBER-MERCHANT'S and BUILDER'S GUIDE

By WILLIAM RICHARDSON & CHAS. GANE, of Wisbech.

Containing about 500 pages, 12mo. Should be on the desk of every one connected with the trade, and will be found invaluable for casting and checking invoices, etc., both in reduction of quantity and money, with other information. Order early of

JOHN WEALE, High Holborn.

Supplied to Subscribers only.

NICHOLSON'S CARPENTER'S GUIDE; being a complete Book of Lines for Carpenters, Joiners, Cabinetmakers, and Workmen in general, on methods entirely new, founded on Geometrical principles, and explained in practice by Engravings, wherein the utility of every line is fully exemplified. A New and Improved Edition. Edited by JOHN HAY, Esq., Architect. In 28 Parts at 1s

J. S VIRTUE, London, and 47½, Dawson-st., Dublin.

Published every FRIDAY Evening in time for Post. Price 5d. Stamped.

THE WEEKLY AGRICULTURAL REVIEW and IRISH COUNTRY GENTLEMAN'S NEWSPAPER, conducted by Professor CHARLES A. CAMERON, assisted by eminent scientific and practical writers.

Each Number contains several Original Articles on Agriculture, Horticulture, and the various departments of Rural Industry; Sporting Intelligence; Literary and Scientific Notes; Reports of Agricultural Meetings and Exhibitions; an ample Summary of News—Foreign and Domestic—including the latest Telegrams; a full and accurate Report of the Markets; a special Report of the Corn Trade, Etc.

Subscription—Stamped, £1 per annum.

"Agricultural Review" Office,
7, Great Brunswick-street, Dublin.

THE LAMP, a Weekly Illustrated Journal of Literature, Science, the Fine Arts, etc. Edited by JAMES BURKE, A.B., Barrister-at-law, Author of "Abridgment of Lingard's History of England," "Memoir of Moore," "Memoir of Edmund Burke" (prefixed to Speeches), "Annual Abridgment of the Statues," etc.

The LAMP contains deeply interesting Tales; beautiful Illustrations of Places and Events of Interest; Lives and correct Portraits of distinguished Characters; Essays by eminent writers; Poetry of a high character; Reviews of, and Extracts from, the newest and most agreeable Books; Abstracts of important Lectures; entertaining Varieties; and Notes on important Events.

Six Copies sent prepaid for Sevenpence, and the Monthly Parts for Eighteenpence a quarter.

The extensive circulation of the LAMP among all classes (to which that of no other Catholic periodical approaches) offers a most favourable medium to Advertisers. The Terms are—*in the Weekly Number:* Not exceeding 4 lines, or 36 words, 2s.; for every additional line, or 9 words, 4d. *On the Monthly Wrapper:* Not exceeding 4 lines, or 36 words, 1s. 6d.; for every additional line, or 9 words, 3d.

London: THE CATHOLIC PUBLISHING AND BOOKSELLING COMPANY (Limited), Charles Dolman, Manager, 61, New Bond-street, W., and 6, Queen's Head Passage, Paternoster-row, E.C.; and J. MULLANY, 1, Parliament-street, Dublin.

PATENT ASPHALTE ROOFING FELT.

ELLIS AND CO.,
PATENT FELT MANUFACTURERS,
157, Fenchurch-st., London, E.C.;
20, Dutton-st., Liverpool; and
Malone Mills, Belfast.

ASPHALTIC ROOFING FELT, a light, clean, economical, and durable roofing, price 1d. per square foot. Samples and instructions may be had gratis in answer to letters from any part addressed to MAURICE BROOKS, IRONMONGERY, GLASS, & ROOM PAPER WAREHOUSE, SACKVILLE-PLACE.

GEORGE B. STAR, DECORATOR,
HOUSE PAINTER, AND GILDER,
IMPORTER and MANUFACTURER of DECORATIONS, and ORNAMENTAL PAPER HANGINGS,
No. 7, LOWER ORMOND-QUAY,
(within seven doors of Capel-st., Essex-bridge.)

ROOM PAPERS in great variety, 4d. to 40s. per doz.
GILT MOULDINGS do. 1½d. per ft. upwards.
LAMINATED LEAD for Damp Walls, 6d per lb.
PREPARED OIL & GUTTA PERCHA PAPERS, ditto, 1s. 6d. to 3s. per doz.

ESTIMATES for Painting and Decorations supplied free of charge.

NOTE.—The Trade, Builders and Gentlemen having extensive House Property SUPPLIED at WHOLESALE PRICES.

THE SUBSCRIBER begs leave to announce to the Noblemen and Gentlemen of Ireland that he has commenced business in BALLINASLOE as AGRICULTURAL ENGINEER and ARCHITECT.

From his extensive experience in the west of Ireland, promptitude in business, and moderate charges, he hopes to merit a share of public patronage.

Lands levelled and laid off for irrigation, and Rivers levelled and laid off for water mains. Drawings and Specifications for Meal and Flour Mills, Threshing Mills, and Saw Mills, given on the most reasonable terms. WM. MAXWELL.

Dunlo-st., Ballinasloe, May, 1859.

W. B. MICKLETHWAITE, STAMFORD ARCADE, ASHTON-UNDER-LYNE, near MANCHESTER, ENGLAND, and Manx Arms Hotel, 38, Fleet-street, Dublin, Agent for Green and Jackson's Mortising Machines, Mr. Horsfall's Patent Mitering Machine, Mr. Furness' Machinery, Messrs. Greenwood and Batley's Improved Ribbon Sawing Machines, and J. Ellis, jun., and Mr. Cordingley's Steam-engines and other Machines worked by hand or power, for Builders, Contractors, &c.

MAW AND CO'S MOSAIC PAVEMENTS.

GEORGE HOLMES AND CO., 10, SIR JOHN ROGERSON'S QUAY, are prepared to furnish Architects and Builders with designs and estimates for Mosaic and Encaustic Pavements for Halls, Conservatories, Corridors, etc., and execute all orders with expedition. These Pavements being "imperishable" will be found a highly-decorative and most economical substitute for ordinary floors and their perishable coverings.

Benthall Works, Broseley, Salop.

Miscellaneous.

ARCHITECTURAL PHOTOGRAPHIC ASSOCIATION.

President—C. R. COCKERELL, Esq., R.A.
Trustees.
P. HARDWICK, Esq., R.A. | S. SMIRKE, Esq., [illegible]
WILLIAM TITE, Esq., M.P.
Treasurer—THOMAS HENRY WYATT, Esq.

THE objects of the Association are:

To procure and supply to Subscribers Photographs of Architectural Works of all Countries; to form a Collection of such Photographs; and, if desirable, to exhibit them; and in any other manner to render the Art of Photography serviceable to the promotion of the knowledge of Architecture, and to the requirements of the Profession.

An Exhibition of Photographs takes place [illegible] in every year, from which Subscribers are entitled to make selections, subject to such conditions as the Committee consider it expedient to make.

Subscriptions are due on the 1st of January for every year.

⁂ Subscribers' names will be at once enrolled on the list of the Association, on application to the Honorary Secretary, Mr. ROBERT HESKETH, 95, Wimpole-street, W. Subscriptions of not less than a Guinea from each Subscriber may also be paid to him. Post-Office Orders to be payable in Old Cavendish-street, London, W.

Local Honorary Secretary, C. Papworth, 7, Talbot-st.

EARLY PAYMENTS FOR LIFE ASSURANCE VERY CONSIDERABLY REDUCED.

It frequently happens that Heads of Families would wish to make a larger provision for those dependent on them than they find they can afford to do when required at once on Assuring to pay the full Annual Premiums. To meet such cases, and to enable provident persons to procure Policies at the Low Premiums charged for Young Lives, the Directors of

THE PATRIOTIC ASSURANCE COMPANY have resolved to charge, when required, *only One-half of the First Seven Years' Premiums* on Participating Policies, the other half being allowed to remain Unpaid at Interest as long as the Policy-holder pleases.

FIRST YEAR'S PAYMENTS FOR £500 POLICIES,
Allowing Participation in Profits.

Age 20.	Age 30.	Age 40.	Age 50.
£4 18 0	£6 1 0	£8 10 0	£11 13 6

Life Policies involve payments of large sums of money at distant periods, and it follows that by far the most important point to be ascertained by an intending assurer is, that real security will be afforded him. The element of security is all-important in assurance transactions, and yet 37 English Companies are winding up in the Court of Chancery, and 22 English Companies last year transferred their business.

The CAPITAL of the PATRIOTIC ASSURANCE COMPANY OF IRELAND is *ONE MILLION FIVE HUNDRED THOUSAND POUNDS:* complete security is thus afforded.

The Regulations of the Company are very liberal.

No charge is made for Entrance Money, Medical Fees, or Policy Stamps.

THIRTY DAYS are allowed for Renewal of Life Policies, and the Assured are held protected during these Days of Grace.

LOANS are ADVANCED on Approved Personal Security, in connection with Life Policies, without Money Bond or Warrant being required.

PATRIOTIC ASSURANCE COMPANY,
FOUNDED 1824,
CAPITAL £1,500,000,
HEAD OFFICES, 9, COLLEGE GREEN, DUBLIN,
With Agencies in the Principal Towns in Ireland.

J. MONCRIEFF WILSON,
Secretary of the Company.

SMOKY CHIMNEYS effectually cured by HENRY SHAW, 8, BACHELOR'S-WALK.

ROGERS'S PATENT PEAT CHARCOAL, for Sanitary Uses generally: for Disinfection of the Dead, Purification of Sick Chambers, Filtration of Water, Purification of Ships, Stables, Cattle Sheds; for Packing Provisions, Eggs, Butter, &c.; and for Agricultural Purposes. Manufactured by THE HEALTH OF TOWNS IMPROVEMENT COMPANY.

Works and Depots:—Derrymullen, Robertstown, Co. Kildare; Newcomen-bridge, Dublin; 5, Donegal-square, North, Belfast. General Agent—JOSEPH G. THOMPSON.

The Dublin Builder.

Vol. I.—No. 9.

TRADES' COMBINATIONS.

THE DUBLIN CARPENTERS' STRIKE.

OF the events passing in the English metropolis during the last month—a memorable one to all connected with the building interests there—*we*, in common with many others, were content to remain mere spectators, though awaiting the sequel with intense interest and anxiety; but now the case becomes altered—the storm rages at our own doors—all the fearful results accruing from separation and ill-feeling between masters and their employées threaten *us* likewise, and the time has arrived for the energetic application of every faculty speedily to solve the question at issue. On the 13th ult. the operative carpenters of this city served notice on all their employers that the body had *determined* on an increased rate of wages—viz., from 4s. 8d. to 5s. per day for each man. Receiving no answer to this, they concluded that their demand had been complied with; but to their surprise, as is alleged, they were informed on the following pay day, the 20th, of the employers' determination to resist. On Monday morning, therefore, they left off work, and it must be remembered that the employers' doors *were not shut against them*—a course adopted in London as retaliation on the body.

Viewing the demand in its most impartial light, it seems to resolve itself into two considerations—viz., whether, under existing circumstances of trade, the operatives on strike place a fair marketable value on their labour; and secondly, if so, is the movement—so suddenly made—calculated to the attainment of their object to their permanent benefit, and, in fact, is it judicious and well-timed? That famine, pestilence, and emigration have thinned the trades, must be conceded by all; likewise, that where there is a scarcity of labour there must follow, *de necessitate*, a rise in the market, if the demand be disproportionate to the supply; but admitting this to be the case at present, are the circumstances such as to justify an immediate advance of wages? Does it follow because one or two contracts of some magnitude have been undertaken for commercial houses, to be executed within an unreasonably short and almost impossible period, under stringent clauses and heavy penalties, and that a few contractors have been in consequence coerced into submission, because there are not hands enough amongst an exclusive society of artizans to supply the temporary emergency, without to some extent inconveniencing the regular business of the city, that this pressure is likely to continue? A few weeks at most will decide this. The plasterers have already followed the example set by the carpenters, and have declared their intention of advancing their wages; the masons, the stonelayers, bricklayers, slaters, &c., are likely to adopt a similar course. Where will this end? or how can existing contracts afford a deduction of 7¼ per cent. on the item of labour? One thing we prophesy—this movement will affect, to an incredible extent, the speculative building of the suburban districts, which for some years has afforded a vast amount of employment to a number of hands; for speculation cannot continue in the face of an advancing labour market. If, contrary to our expectation, it still exists, the consequence will be, that this business will be thrown entirely into the hands of builders who do not employ what are called the regular men. We freely advocate the tradesman's rights to fair remuneration for his toil—we heartily wish to see him occupying a prosperous position in the world, and a respectable one in his domestic circle, to which constant employment and fair pay are essential requisites; but we abhor "combination" to effect, by undue pressure at an awkward period, an object which, legitimately and calmly pursued, might tend both to a successful result and to preferment in the social scale, rather than the reverse. A popular fable suggests a moral deducible from the event we treat of, that it may prove imprudent—nay, fatal—for members, relying too much on their numerical strength, to rebel against the main source on which they rely for subsistence; the error is discovered when too late, and the continued obstinacy of the members has so weakened the main spring, that it becomes incapacitated to act, and sinks into oblivion, drawing in its wake the perpetrators of its and their own ruin. Such might be—we sincerely trust not in this instance—the result of a protracted combination; and though we have only *now* to deal with *one* section of an extensive community, we know not where the influence may ultimately end, or how far a general principle may be affected by a partial decision. Or, again, if employers should feel chagrined at an undue advantage being seized on by their workmen, they may, from temporary pressure to perform heavy contract works, yield—*we do not assume advisedly that they will*—but it may be to reserve at a future date, biding their own time, the period for retaliation, when they shall place themselves—by a supply of labour from the provinces or elsewhere, and by calling in a potent aid, which in carpentry work especially is rapidly superseding manual labour—beyond the reach of *further* combination.

This doctrine of probabilities we would emphatically impress on the minds of all concerned, that in calm reason each point may be weighed, and mature judgment induce to a course which will ultimately secure mutual benefit.

The Cathedral of Notre Dame.—The *Ami de la Religion* publishes the following details on the subject of the central spire which is now being reconstructed on the Cathedral of Notre Dame. The steeple in wood covered with lead which formerly crowned the centre of the old cathedral dated as far back as the 13th century. It was demolished in 1797, either because, being in want of repairs, it was more easily removed than restored, or because the quantity of lead with which it was covered was required for casting musket balls. A project for repairing the cathedral was first taken into consideration by the government in 1845, but nothing was then decided on; the plan was again examined in 1853 by the imperial government, but the erection of the spire was postponed in consequence of the necessity which the architect felt for first repairing the central arched roof of the building, over which the proposed erection was to stand. The preparation of the wood-work for the spire was commenced in August last, and the first pieces were in their places in February last. The spire, which will be 135 feet above the top of the roof, and 280 feet above the floor of the church, does not start suddenly from the roof like those of the cathedrals of Amiens and Orleans, but stands on open arches, thus giving it a much lighter effect. These arches are surmounted by statues of the Twelve Apostles and the four emblems of the Evangelists, and it is from above that range of figures that the steeple starts. The iron cross at the summit will be about 24 feet high, and is surmounted by a gilt weathercock. The woodwork will be covered with lead, weighing not less than 120,000 kilogrammes. The whole construction will be finished in the early part of next year.

THE PROGRESS OF ARCHITECTURE IN IRELAND:

BY (THE LATE) JAMES GANDON, ARCHITECT.

It was the taste of the Augustan age to mingle an agreeable and varied erudition with scientific works; this we may perceive in Cicero's moral and theological tracts, in Strabo's geography and Vitrivius' architecture. Works thus constructed were more likely to become popular and useful, than treated abstractedly; they amused while they instructed, and, what is of infinite value to us at this day, they preserved much interesting information, sometimes closely, often remotely, connected with the subject. This practice Vitruvius expressly defends in the beginning of his seventh book: "Our ancestors," says he, "did wisely in recording the improvements of every age, by which was gained a vast accession of knowledge. Itaque non mediocres, sed infinitæ, sunt his agendæ gratiæ, quod non invidiosi silentes prætermiserunt, sed omnium generum sensus conscriptionibus memoriæ tradendos curavement." Vitruvius has adopted this conduct in almost every part of his admirable performance; to pursue, therefore, a line sanctioned by such high authority will require but little apology. The profound investigation of a very learned friend* has saved me some labour, nor was it possible to add much to his accurate researches.

It might have been inferred, from the state of society in the northern parts of Europe, in the age of Vitruvius, that mankind then lived in the meanest extemporaneous dwellings, yet it is desirable to know from so accurate an inquirer, what was the mode of construction, and what the material used, because it proves the bardic tales, the historic romances of modern Irish writers, respecting their list of Kings, the splendour of their courts, and their magnificent structures could not, in that or any anterior period, have had existence beyond the imagination of their authors.

A dark cloud envelopes the primæval inhabitants of Ireland, and the transactions of its early colonists are buried in impenetrable darkness, so that if it were not for their language, which, happily, survives at this day, to which may be added customs and manners which distinguish them in every age, it could not with certainty be affirmed that the Celts were the first possessors of Ireland. These Celts, as their name indicates, were woodlanders; in the forests they found dwellings sufficient to support a savage life; the oak was the object of their adoration, and from this oaken worship was denominated Druidic; they practised those arts which necessity suggests in the dawning of society—"Some," says Vitruvius, sheltered themselves in caves from the inclemency of seasons, or formed a covering with the branches and leaves of trees; others, imitating the swallows, erecting round cabins, 'non nulli hirundinum nidos et ædificationes earum imitantes.'" "Experience," continues he, "taught them new improvements; they set up forked sticks, laced the intervals with twigs; on this, at first, they made a flat roof, but this transmitting the rain, they afterwards gave it a rise, and pointed the top, in order to give a fall to prevent the water lodging; they also formed houses of split timber, and covered them with straw." Bede, writing about 720, tells us, that Finan, an Irish bishop, built his church entirely of split oak, and covered it with reeds; and this custom prevailed in every age. Henry II., in 1172, to conciliitate the regards of his new subjects, by conforming to their customs, made a long and spacious pavilion of smoothed wattles, wherein he entertained the Irish princes. At the end of the sixteenth century, Spencer mentions the Irish boolies or wicker dwellings in which the natives and their cattle had a common lodging. At this day the mud walls, and wattled roofs covered with straw or reeds, preserve the original Celtic practice, as the churches of Derry, Kildare, and others, do, in their names, the remembrance of their having been primitive Celtic temples in oaken groves. With the arrival of the Belgic colonists, called Firbolgs (by Irish chroniclers), began the dawn of architecture in this island. Those Firbolgs were a naval and mercantile people from Belgic Gaul, who settled in Britain antecedent to the Roman invasion of it. Richard of Cirencester mentions the menapu and cauci. Belgic tribes being in Ireland at the time of Julius Cæsar, and vestiges of these foreigners may at this day be traced in the jargon of those parts where they first settled themselves. The baronies of Forth and Bargy, in the county of Wexford, though far from being polished, greatly surpassed the Celts in the knowledge of useful arts. They were acquainted with metallurgy; they formed and inhabited souterrains, and secured them by rude arches; they could raise, and convey to appropriate places, large and massy blocks of stone, erect them perpendicularly in circular or other places, and crown them with ponderous trilithons. A great number of these caves and temples exist in various parts of Ireland, and they resemble, in every minute particular, the religious structures and dwellings of the same people in the northern parts of Europe. Though the Gospel was preached in this isle in the third or fourth century, and the use of letters introduced, yet neither produced, for some ages any alteration in the manners or dwellings of the natives. Tanistry, gavelkind, and other Brehonic institutes, made them barbarous, and they continued so for a considerable period; the consequence was, that the Christian missionaries were obliged to give way to the prejudices of their new converts, they carved crosses on the upright stones, and erected their chapels in the circles which they formed, called Cloghans, thus gradually changing the object of their adoration.

In the eighth and subsequent centuries numberless swarms of piractical rovers issued from Norway, Denmark, and the shores of the Baltic, and overspread this and the other British Isles: their religion was widely different from that of the Irish primitive churches, nor did the latter adopt the superstition of the times until overborne by the iron hand of power. The relics of saints were now objects of great adoration; no church could be erected without procuring some of the bones or garments of the patron to whom the edifice was dedicated. To preserve these from conflagration to which wooden structures were liable, was a matter of serious concern—and could only be effected by a stone vault not liable to be injured by fire, or the vicissitudes of seasons.

The Ordo Romanus, compiled in the ninth century, directs the mortar for such receptacles to be made with holy water. A great number of these cryptical buildings exist, such as at Cashel, Portaferry, Saul, Killaloe, St. Doulagh's, near Dublin, and other places. A tomb was made in the centre of these chapels, the relics laid in them, and the stone that covered them served for an altar: this is exactly the case with the stone-roofed crypts at Glendalough and Cashel; the curious and uncommon sculpture decorations on the portal of the former evince the taste of the northern invaders in the arts of design and composition; and had a state of society admitted of architectural exertions, they were no way incompetent to produce structures of superior order; but wretched municipal laws, and a perpetual warfare, not only among the natives themselves, but also with foreigners, prevented any further progress in the culture of the arts at that time. Religion alone could overcome these obstacles; many stone churches were erected, and the active zeal of the Christian clergy at length constructed fabrics of greater magnitude, and more suited to the object of their professions. Their first attempt at a lofty building was the round tower, a singular and very curious structure, of which there are more remaining in perfection in this isle, than in any other part of Europe.* It is not easy to assign a reason for the prevalence of adopting the rotund figure at this time; that it was brought by the Irish missionaries from the Continent in the ninth century, whither they resorted in great numbers, it is the probable conjecture of Dr. Ledwich, who has learnedly discussed this subject, and thrown as much light on it as imperfects surviving supply. It appears to Dr. Ledwich that the archetype of these towers was the square steeple found annexed to continental churches; and that, as our religious edifices were of wood, and the sanctity and imposing effect of the bells but little inferior to that of relics, a stone belfry was the only appropriate building for such purpose. Whether the architects of these ages, who were ecclesiastics, esteemed rotundity the figure best calculated for durability, is not easy to ascertain; it is, however, evident, that much art was not required in their construction, as all the round I have seen are erected of rubble-stone, and in irregular courses, having neither external nor internal arches; and there appears no regular system observed in their arrangement in the different storeys, either as to their elevation or number. It is evident that chases are left in the walls of some to receive the joists, in others they are laid on corbels, or internal set-offs; they likewise vary as to their general heights and thickness of the walls; that remaining at Kells is ninety-nine feet high, seven feet diameter at bottom, and four feet six inches at the top; the round tower at Lusk, in the county of Dublin, is only three feet at the top. What is very remarkable is the distance of the door from the ground; in the greater number remains it is about ten feet, but in the round tower at Kilmacdhach, the height being 110 feet, the entrance from the ground is twenty-four feet. This elevation of the door has not yet been accounted for satisfactorily.

Cormac's Chapel, at Cashel, is a work of very great antiquity; it is stone-roofed, and the first attempt at a nave and chapel in Ireland; there is scarcely a monument of the tenth century in Europe, so well preserved, or so interesting to the lover of ecclesiastical architecture, except St. Kevin's tomb at Glendalough, and the round tower there.

The rude architects of this period, from the specimens of their art now enumerated, were able to construct larger edifices, and to ornament them with sculpture. Encouragement, practice, emulation, might have advanced their exertions to some degree of perfection; but at this period the nation was uncivilized, and the clergy, who were the only architects at this period, employed themselves exclusively in erecting religious buildings, and civil architecture was entirely neglected. A proof of what has been advanced may be satisfactory. Malachy, Archbishop of Armagh, in 1148, made a stone oratory at Bangor. St. Bernard, in the life of this prelate, introduces one of the natives, saying to him, "What could induce you to bring such a novelty into our country; don't you know we are Scots (Irish), not Gauls (foreigners)?" expressing thereby their resentment at such innovation, for the Irish oratories were of wood. In the year 1145, Gelasius, Archbishop of Armagh, constructed a lime-kiln seven yards in diameter; this is recorded in the Irish annals, which would not have been the case had the manufacture of lime been then a common operation. I refer to Du Cange's Glossary, and Barrington on the Welch Castles, to evince that the Irish were not inferior to the Spaniards, Welch, or French, in the practice of masonry at that time.

---

* Dr. Ledwich.

* There are two remaining in Scotland; one at Brechin, another at Abernethy.

The Norman princes introduced and cultivated it in their numerous castles and ecclesiastical structures in England, and on their arrival in Ireland they soon filled the country with fortresses and abbeys. The style of buildings in Ireland could not be dissimilar from that in the sister isle, because the same architects designed and erected the different buildings in both countries; and the Saxon style, as well as the Gothic, is clearly traceable in the ancient architectural structures of the country. Dr. Ledwich, in his observations on our ancient churches in the Archæologia, has investigated the origin of these styles, as far as authentic documents enabled him to proceed; to these I shall take the liberty of adding a few remarks.

Mr. Essex, after pronouncing the eulogium of Gothic architecture in the fourth volume of the Archæologia, appears so totally possessed by its beauty, proportion, and execution, as not to hesitate in affirming that, like the Grecian, it has its orders, and every order its peculiar proportions, founded on geometrical principles, and as capable of demonstration as the Grecian or Roman architecture. In this assertion I consider Mr. Essex has suffered himself to be carried away by too much prejudice, and such opinion I consider to be altogether unfounded, as can be elucidated by an attentive inspection of the variety of Gothic buildings now in preservation.

Another writer[*] on this subject gives his opinion that the Gothic architects assimilated the proportions of their buildings to those of the human body, and that the pyramidal form exists throughout the component parts of a Gothic edifice; and that from such an ordination none other but a pointed arch could be used. It may here be asked, what model was used for regulating the distribution and symmetry of such a building, for the Greeks and Romans worked by a model taken from the diameter of the columns, divided into a certain number of parts, which served to regulate their proportions, together with that of the entablature and other parts appertaining to the order. I do not consider that any Gothic structure can admit such investigation, and the writer candidly owns that there never was a species of architecture, the properties of which could be determined from the arch alone; and I do not consider the author of these ideas on the origin of Gothic architecture, has established any satisfactory principle (if any the early architects had) to regulate their designs.

REPORT OF THE CITY ENGINEER, WATER WORKS (DUBLIN).

Gentlemen,—I have carefully read over the Report that you have received from your Consulting Engineer, Mr. Hawksley, on the subject of the improvement of the supply of water to the City of Dublin.

I find that the result that he has arrived at, after the examination of the different plans submitted to you for the improvement of the water supply, is as follows:

Under all the circumstances of the case, he is of opinion, that the best and most economical plan for you to adopt is, to continue to derive the supply of water for the use of the City from both Canals, but under a very different arrangement from that at present existing.

He proposes that you should take the supply from the Canals, provided they will undertake to give a guaranteed and preferential supply of not less than ten million gallons of water per diem, at a fixed rent, in perpetuity, of £2,500 per annum; and he proposes to retain the supply at present drawn from the Dodder into James's-street Basin, for the use of certain large consumers, such as manufacturers, distillers, &c.

If this arrangement can be carried out by the Corporation, with the Canal Companies, Mr Hawksley recommends that the water be taken from the Grand Canal Company, from the pond or level at the head of the 11th Lock, near Clondalkin; and that on the land adjoining this a service reservoir, filter beds, and pure water tank should be constructed, from which the water should be conveyed to join the present mains, distributing the water through the City by a 36-inch main; and that the water should be taken from the Royal Canal at the eastern end of the pond or level above the 12th Lock, at Blanchardstown; and that a service reservoir, filter beds, and pure water tank should be constructed on the adjacent lands, from which the water is to be conveyed, to join the City mains, by a 30-inch main.

The cost of those works, including the necessary alterations of the pipeage of the City, in connecting new works with old, &c., he estimates at £137,000. . . . .

I am not sufficiently acquainted with the size of the works that Mr. Hawksley proposes to construct, to be able to form any estimate of their probable cost; but, from his high character and long and extensive practice in works of this character, the Committee may safely adopt his estimate as correct: and, taking this to be the case, I believe that the improved supply of water can be got for the City, from the Canals, at a less cost than from any other source.

From the experience I have had in connection with your works, now for ten years, I believe that neither Canal can of itself, under existing circumstances, give you the quantity of water you require, therefore, that you must deal with both.

With regard to the quality of the water for domestic use, although it is not as soft as that which could be got from the granite districts of the Dublin aud Wicklow Mountains, and consequently not so good for brewing, washing, and culinary purposes, yet it is a good water, colourless, and not above the average hardness of the water supplied to London and many other large cities and towns: and when taken at the distance from the City proposed, and properly filtered, will be of a very superior quality to what it is at present, delivered from the City Basins.

Under all the circumstances of the case, and after giving the subject my best consideration, I feel bound to state, that I believe that if the Canal Companies agree to give the water, as mentioned, for the sum of £2,500 per annum, that it will be best for the Corporation to carry out the plans of their Consulting Engineer, and adopt the Canals as the source for the improved water supply to the City.

But in any contract entered into with the Canals, I suggest that there should be some arrangement as to the price at which they would supply any additional quantity which may be hereafter required.

In conclusion, I have to submit for the consideration of the Committee, suggestions as to how the funds required for carrying out the proposed works can be procured. . . . .

Mr. Hawksley estimates the cost of the works he proposes at £137,000. This sum I consider should, if possible, be borrowed from the Government on the same terms as they have lent money to carry out drainage works, namely, to be advanced as a rent-charge on the rates for twenty-two years, paying six and a-half per cent. per annum, so that at the end of this period both principal and interest would be paid.

Six and a-half per cent. on £137,000 amounts to £8,905, therefore, the present surplus income is only about one-third of the amount which would be required to pay this interest. . . . .

From experience as to the amount realised from the Improvement Rate and Sewer Rate on the present valuation of the City, I calculate that a rate of 8½d. in the pound will produce an income of about £16,270, and if to this be added the probable revenue to be derived from supplying distilleries, breweries, manufacturers, public and government buildings, &c , say £2,000 per annum, this rate of 8½d. in the pound will be sufficient to enable you to raise money upon the sinking fund principle to construct your proposed works, in which case the charge of £8,905 would cease at the end of twenty-two years, when a rate of about 4½d. in the pound would be sufficient to meet the remaining engagements and maintenance of the works. On the other hand, supposing the £137,000 borrowed in the ordinary manner at four per cent., a rate of about 6½d. in the pound would be sufficient, but in this case the charge would remain permanent on your works. . . . .

In the new Bill powers should be obtained to enable you to supply, when called on, water to the Township of Rathmines, aud the districts of Ranelagh, Baggotrath, Ringsend, Irishtown, and Sandymount, and also to Clontarf, Richmond, &c., on north side of the City.

In 1854, I estimated the probable cost for laying down mains to to supply Rathmines, Ranelagh, Ringsend, Irishtown, and Sandymount with water at £30,000, but this calculation was made when iron was very much higher in price than at present, and I think the necessary works could now be done for £25,000. The income I then calculated to be derived from this outlay was about £1,250 per annum, but from the rapid increase of building since this, I should expect that now a considerable larger sum would be received, with the prospect of a steady annual increase—supposing that a charge at the rate of 6d in the pound on the Poor Law Valuation, was levied, which would be very moderate.

---

[*] See Murphy's Batalka.

With regard to the present valuation of the districts here alluded to, I would suggest that the Committee ought to procure correct copies of Mr. Griffith's Valuation, with the view of ascertaining the probable income that would be derived from their supplying those districts.

PARKE NEVILLE,
City Engineer.

The following has appeared as an *advertisement* in the local papers, and we reprint it as a matter of courtesy to the operatives, that all particulars, and the views of both masters and men may be *impartially* put forward in our columns:—

THE CARPENTERS OF DUBLIN TO THE PUBLIC.

"There is too much suffering and too much perplexity in the condition of the working classes; it is a disgrace as well as a danger to our civilization; it is absolutely necessary to render their condition less hard and less precarious."—*The late Sir Robert Peel to M. Guizot.*

"It was not correct to say that no strike had ever been successful; but those only had been successful which had taken place during a rising market. No doubt a workman was entitled to ask for an increase of his wages if the produce of his labour was rising."—*Sir A. Alison in a Lecture delivered in the City hall, Glasgow, March* 15, 1859.

A more lengthened statement of our affairs having been promised, we would have kept our word but we were prevented by many of our employers having, in the early part of the week, acceded to our demands. We fondly hoped that before this all of them would have done so, but such not being the case we are bound to make the following statements:—As there is an impression abroad, not alone in Dublin, but in London, that there is a strike for wages by the Carpenters in this city, we would wish to disabuse the public mind on that point. For many weeks previous to the circular being issued informing the employers that our wages for the future would be 5s. per day, the greater portion of the members of our trade was receiving that sum. The men who in the employments (some had left and accepted of higher wages) at the old standard of 4s. 8d. felt that they were not acting fairly to themselves by not looking for the same. What were they to do? Leave their employment and get it where it was given. That course would not be either just or prudent, No! They said to their respective employers, we are willing to remain with you, give us the same wages we will get through the city. The majority of them did so, and the men remained at their work. That the greater number did comply, the fact of 450 men, out of 530 being at work at the increased rate, fully proves the men who did not get their demand had no alternative but to leave. They have (with the advice of their trade) refused many offers during the past week—even at a rate above what they required—but expecting to be called into their old employment, refrained from accepting such. Now the question naturally arises were these men wrong in looking for an increase in their pay, when in the majority of cases it had been offered to them?—Were they wrong in taking a step to advance their social position? Were they to derive no benefit from the application of machinery to their work, or was the profits arising from such, all to flow into the pockets of the employers. We ask an impartial public to decide. Take our relative positions Look at the builders, when a few years at their vocation, they have ranges of houses, a luxurious home, private vehicles, and more than all this, the consolation that, in their old age, the comforts they enjoyed through life cannot be abridged. Then turn to the working man—What has he, or what has he to look forward to—a poor slave, subject to every whim and caprice of those over him—an unfortunate toiler, whose precarious existence depends as much upon a looked-for obsequiousness as upon the talents that God has given him? What had he to look for in his old age, brought on prematurely by anxiety and incessant toil? As it approaches, his wages is reduced, his chances of employment are lessened, his comforts, small as they were through life, disappear, and he ultimately finds himself a burthen to his friends or an inmate of a poorhouse. Are these men to be blamed for endeavouring, at a season like this, when the labour market is up, to procure for it as much as possible.

But a few words on the matter of dispute. We claim an addition of four-pence per diem to our pay on these grounds (perhaps the only ones acceptable to the superficial observer). Our labour is the only commodity we have to dispose of. Will we not be accorded the same privileges enjoyed by the corn-factor or the timber merchant. That is, to rise the price of the article when there is a scarcity of it in the market. We did not take advantage of that admitted practice—a practice endorsed by the names of all writers on political economy. No. We waited till the purchaser raised the price, and it would be very foolish in us not to accept it.

We would, in conclusion, wish to contradict a report prevalent through the city, that we intend to look for a diminution of the hours of labour, and other advantages, which would be injurious to the master builders. Such is not the fact. The only demand we made or intend to make, is the increase of four-pence per diem in our wages, and by that we are determined to stand. Signed on behalf of the trade, THOMAS PARKER.

IMPROVEMENT OF LABOURERS' DWELLINGS.

In the course of His Excellency's admirable speech at the banquet after the Royal Agricultural Society's recent Cattle Show, at Dundalk, he took occasion to observe that, among other improvements in our country, progress has been nowhere more remarkable than in the dwellings of the labouring classes. The subject is now under the immediate consideration of the Imperial Legislature, a bill having been brought in upon the matter by an excellent gentleman of a neighbouring county, Sir William Somerville. I know that the subject has largely engaged the attention of another gentleman from the same county, whom I have the happiness of seeing at this board, Mr. Naper; and I find with great satisfaction that the Royal Agricultural Society of Ireland, which is peculiarly qualified by its position and its objects to take the lead upon such a subject, announces it as as one of its constituent and primary objects to promote improvement in the dwellings and domestic condition of the people of Ireland, and they have founded prizes for the best cottages.

Nature and Art.—I remember that, being abroad one summer day, my companion pointed out to me a broad cloud, which might extend a quarter of a mile parallel to the horizon, quite accurately in the form of a cherub as painted over churches—a round block in the centre, which it was easy to animate with eyes and mouth, supported on either side by wide-stretched symmetrical wings. What appears once in the atmosphere may appear often, and it was undoubtedly the archetype of that familiar ornament. I have seen in the sky a chain of summer lightning, which at once revealed to me that the Greeks drew from nature when they painted the thunderbolt in the hand of Jove. I have seen a snowdrift along the sides of the stone wall, which obviously gave the idea of the common architectural scroll to abut a tower. By simply throwing ourselves into new circumstances, we do continually invent anew the orders and the ornaments of architecture, as we see how each people merely decorated its primitive abodes. The Doric temple still presents the semblance of the wooden cabin in which the Dorian dwelt. The Chinese pagoda is plainly a Tartar tent. The Indian and Egyptian temples still betray the mounds and subterranean houses of their forefathers. "The custom of making houses and tombs in the living rock," says Heeren, in his Researches on the Ethiopians, "determined very naturally the principal character of the Nubian Egyptian architecture to the colossal form which is assumed. In these caverns, already prepared by nature, the eye was accustomed to dwell on huge shapes and masses, so that when art came to the assistance of nature, it could not move on a small scale without degrading itself. What would statues of the usual size, or neat porches and wings have been, associated with those gigantic halls before which only Colossi could sit as watchman, or lean on the pillars of the interior?" The Gothic church plainly originated in a rude adaptation of the forest trees with all their boughs to a festal or solemn arcade, as the bands about the cleft pillars still indicate the green withes that tied them. No one can walk in a road cut through pine woods, without being struck with the architectural appearance of the grove, especially in winter, when the barrenness of all other trees shows the low arch of the Saxons. In the woods in a winter afternoon, one will see as readily the origin of the stained-glass window with which the Gothic cathedrals are adorned, in the colours of the western sky seen through the bare and crossing branches of the forest. Nor can any lover of nature enter the old piles of Oxford and the English cathedrals, without feeling that the forest overpowered the mind of the builder, and that his chisel, his saw, and plane, still reproduced its ferns, its spikes of flowers, its locust, its pine, its oak, its fir, its spruce. The Gothic cathedral is a blossoming in stone, subdued by the insatiable demand of harmony in man. The mountain of granite blooms into an eternal flower, with the lightness and delicate finish, as well as the aërial proportions and perspective of vegetable beauty.—*Emerson.*

Locomotive Engines on Ordinary Roads.—Many difficulties attend the application of steam to ordinary roads, and have hitherto prevented its employment for that purpose. The traction force, owing to absence of rails and inequality of surface, is vastly increased, as also is the necessary complication of machinery, and the wear and tear. Carriages *can* be drawn by steam power along common roads, even over steep ascents; but the fall from stones, and the descent into ruts on ordinary roads, must be prejudicial to economy on the one hand, and facility of conveyance on the other.

THE WATER SUPPLY OF DUBLIN.

"Two tales have we told,
Another we'll unfold,"

WHICH, perhaps, may suffice to put our fellow-citizens on their guard as to what may be done, or ought to be done, in this momentous question. We can all, perhaps, now understand the difference between the wants which existed in London and Dublin, and the means taken to supply them—can judge whether the authorities of either places could justify themselves for either joining in or permitting such monstrous abuses as took place—and form a fair opinion upon a question which is in reality belonging to the public at large, and not to a profession or a clique.

We want our general readers of Dublin to understand the real bearings of a question, which not only affects themselves, but their children and children's children. We greatly desire that they should see the breakers a-head before they trust to pilots which may run them ashore again; and we hope to gain the support of the large majority in our doctrine, that *water for the public should be supplied to the public at its lowest possible cost*, and that it is the bounden duty of the authorities, into whose hands we trust the management of our affairs, to see that it is so; just as much as it is the duty of an honest steward to buy our meat and our bread at the cheapest and best market, and no more to permit engineers to hoodwink us, than bakers or butchers. We have a very great respect for our own profession, but have as much disrespect for charlatanism and plagiarism amongst engineers as amongst any other class—perhaps more. There is no more elevated profession, nor one more calculated to elevate the community generally; but just in proportion to its properly high position should be public discredit, if it be lent to the accomplishment of public wrong.

We have told the tale of London and Dublin, let us now see what Liverpool presents. It is so near to home that it may, perhaps, come more home to us, and what has been done there is so like what is now proposed to be done here, that it is essential it should be fully known.

Some years since, when the Chadwick mania for flushing sewers seized some sixty or eighty of the principal cities and towns of England, it was discovered by some of the Corporation of Liverpool that that city could not exist in health from thenceforth unless *a high pressure* supply of water was procured, so that all the houses might be constructed with water-closets in the upper storeys, and it may be said that the upper storeys of the whole city became affected with the mania. It was estimated that the quantity of water necessary for each individual, child and adult, should be 20 gallons per diem, and it was demonstrated to the satisfaction of the whole Liverpool community, by numberless speeches and reports, that no other means could possibly be discovered to save the city from the consequences of its own filth, than that every inhabitant should be supplied with the greater part of the said 20 gallons, to wash it away through the sewers and under the streets into enormous tanks; from which it was to be lifted by pumps, and distributed over all the farms of all the country round.

The two water companies, by which Liverpool had been supplied (and not badly either) up to that time, were called upon to make such arrangements as would meet the "*flushing*" necessities. But, unhappily, they declared it to be impossible. The Board of Public Health, however, having had *a report* made by one of Mr. Chadwick's *employées*, setting forth "that the removal of the refuse of cities through the sewers, *by means of water carriage*, was the best and cheapest," the authorities came to the conclusion that more water must be got, no matter where it came from; and the Board of Health began their labours to construct the proposed means for discharging the city filth through the Chadwick pipes—the water for which was to be supplied by a committee of the Corporation, who began their labours simultaneously to obtain the water.

Most zealously and untiringly did both those bodies work, each in its own vocation; one to devise the best means to collect the filth together—the other to get water to wash it away; and the parliamentary blue books of the two or three years which were occupied in labours to best arrive at other objects, were rivalled by the reports and blue books detailing all that was said and done at Liverpool on the water supply and glazed pipe and flushing systems.

Nothing could be more elaborate than the revelations made on the subject of the water. It was plainly proved that spring water was most unwholesome and unfit for household use—that the only water suitable for such purposes was that which fell from the clouds—and that no matter what description of soil it washed and percolated through when it came down, nor what gaseous impurities it held in itself, nothing could exceed it, both for purity and softness. The result was, that it was determined, on the report of an engineer of high reputation, to construct reservoirs in the Rivington Hills, and collect the water that fell there, bringing it by metal mains of 44 inches diameter, some 23 miles in length, to deliver to the inhabitants of Liverpool a supply of 20 gallons per head per diem. Accordingly the works were commenced and prosecuted vigorously, regardless of expense, in order that there should be nothing to prevent the supply for flushing purposes to be required by the Board of Health, so soon as their flushing works should be completed, and for which *flushing* alone not less than 10 or 15 of the 20 gallons per diem would be required.

Happily, however, for Liverpool, as regards the sewerage question, and unhappily as regards the water supply, the eminent engineers to whom the former had eventually been referred, proved that the Chadwick glazed-pipe system was a fallacy; and having reported and demonstrated that the cost, alone, of pumping up the refuse of the town would vastly outbalance all that could be obtained for the matter, even if it were possible to dispose of it at the highest estimated value, the project was totally abandoned. An act of parliament was subsequently obtained, empowering the Corporation to compel certain arrangements to be adopted in the construction of privies and ash-pits, by which the matter might be conveniently removed by and at the cost of the authorities, and from thenceforth it was, and now is, collected and sold by the Corporation, and made one source of its revenues.

Thus whilst one committee was labouring to provide the 20 gallons per head per day, the other laboured till it proved the supply was not necessary at all. But when it had arrived at this most just conclusion, the zeal of one had outrun the other—

for the water committee had irrevocably embarked in all the expenditure, and the inhabitants of Liverpool have now to pay for a supply assumed to be necessary for purposes which will never be carried into effect.

Now let us see what these zealous cross purposes produced as to the nature of the water and the cost.

The water supply of Liverpool is known as "the Rivington Water Works." They consist of several impounding reservoirs and catchment basins, so arranged as to take in the rain-water falling over a vast extent of the Rivington Hills, which, for a great part, are like the hills in the neighbourhood of Dublin, where the catchments for our water supply are proposed to be made, and equally presenting *a vast surface of peat moss or morass;* than which nothing could be more objectionable.

When the water supply of Dublin was agitated at the time the Rivington Works were in operation, this fact was brought out by some of the witnesses examined before the Sanitary Association. But it was then asserted that no evil would arise from the rainfall passing over peat bog, "*because the same class of land was used for the purpose of supplying Liverpool.*"

There were those, however, who could not subscribe to such a doctrine. The report of the Sanitary Association, framed by their engineer, Mr. Jasper Rogers, says, "Almost the whole catchment surface for supplying the proposed reservoir consists of a bed of peat, of slightly fibrous and earthy texture, from four to eight feet in depth. Your committee are of opinion that this fact alone is sufficient to prove that water *for household purposes* should not be taken from the proposed catchments. It is known to every peasant that bog-water is unfit for household use, and your committee believe that no mode of filtration at present known would divest such water of the several properties injurious to the animal system, which it contains."

Most strange to say, this simple fact, which is incontrovertible, seems to be completely ignored. It was assumed to be wrong, *because the engineer for the Rivington Works made use of peat land for catchment purposes.* The *theory* of one man was preferred to the *practice of millions,* for there are millions in Ireland to prove that water coming from bogs is unfit for household purposes. And although it is now admitted and patent in Liverpool that the water taken from a similar source is *bad, discoloured, and unwholesome,* the reality seems to have no effect upon ourselves, and we come to the decision of supplying our wives and children with water that is and must be most injurious to health. It is well known that many families have been obliged to leave Liverpool because of the impurity and unwholesomeness of the water, since the supply was made by catchments from the Rivington Hills. Present filtration does not divest it of that peculiar and special property belonging to the juices of peat, which no chemist has yet been able to define, but which is almost analogous to "*tannin matter,*" though not so in reality; and we need scarcely go farther to satisfy the most sceptical that water containing such an ingredient cannot be wholesome. Why should we, therefore, be put to a vast cost to effect the same end as has been effected in Liverpool? and what that cost will be, if the attempt be made, may be seen from the expenditure there; the items of which are taken from the paper read before the Institute of Civil Engineers shortly after the completion of the works—

"Cost of improvements to Old Works, Purchase Money, &c.	£850,000
Cost of New Works, Reservoirs, Land, &c. ...	750,000
	£1,600,000"!!!

This, it is true, includes the expense of hooping with wrought iron the main pipes conveying the water from the reservoirs to the city, which, after being laid down and the water turned on, were found to be perfectly incapable of bearing the pressure; and the only possible remedy was to re-escavate, hoop, and relay them!

So far for past experiences. In our future papers we hope to point out the need for availing ourselves of them; and it is to be recollected that the engineer to the Rivington Water Works is the same as the Corporation has selected for carrying out similar works here.

THE LONDON STRIKE.

Is there any one of ordinary experience who has not seen with his own eyes the deplorable effects of trade combinations? With hardly an exceptional instance, they have always the same result. They cripple the employer. They ruin the operative. They degrade the character of the district in which the "strikes," as they are called, take place. All the evils of the system are being produced in London just now, on a scale whose magnitude must spread wretchedness, not among a few individuals, but among hundreds and thousands. The present strike is among the builders, and its ostensible object is to shorten the day's labour by one hour. It is euphemistically called "The Nine Hours' Movement;" but it is in reality a movement whose practical end is to make the men the masters over the employers, instead of the employers being masters over their own workmen. Those who organised the strike would listen to no reason. They would not condescend to argue the question, even the employers condescended to argue it with them. It was in vain to submit the consideration that the loss of an hour a-day from each man, and a continuance of the same rate of wages for nine hours as for ten, was an obvious outrage on common sense, and a manifest injustice to the employer. Why, in some extensive establishments, the loss would amount to several thousands annually. Of course, that the master was the person who provided the wages, who planned the works which brought them employment, who encountered all the risk of markets, and debts, and unrestricted competition—this fact, comprehensive enough to ordinary minds, was entirely below the exalted notice of the few brilliant and enlightened workmen who save their fellow-labourers the trouble of thinking for themselves. The leaders advised the workmen to strike, and the latter did so. A particular firm was selected, and their workmen left in a body. They must force the masters, they said, to bow to the nine-hours' movement, and it was proposed to accomplish this by putting a stop to the business of a few establishments, and driving the owners into the *Gazette.* A mild remedy, doubtless, but by no means original.

Nor is it a remedy such as only workmen can use. When the combined published their scheme, they thought they had a copyright of it for themselves and themselves alone. But the employers played them one of their own cards. They combined also. The reasons are given in the counter manifesto issued by the employers. These gentlemen lament the step which their men have taken, but recognise the paramount duty of self-protection. They say that, inasmuch as the associated workmen have arranged that the men remaining in employment shall support those out on strike, it cannot be expected that the employers will continue indirectly to contribute the funds necessary for this laudable object. If the firm selected—Messrs. Trollope and Sons—are forced to give in, the other building-masters will be pulverised in detail. If the masters who have yet escaped the strike continue to pay wages to sympathisers, then, according to their own reasoning, they are guilty of a species of mercantile suicide. Under these circumstances, the associated employers banded together for self-defence, and closed their places of business on Saturday last. There are nearly 300 firms in this category. There are about 30,000 men thrown out of employment by the decided course into which the operative conspiracy has coerced the masters. The employers plainly admit the crying hardships of visiting the sins of the crowd or of individuals on those who may be so utterly blameless as to have no sympathy with the movement; but the masters naturally and cogently ask, what other remedy have we? For ourselves, it is one of those questions which we would like to avoid answering. The masters will re-open their establishments when Messrs. Trollope's men will return to their work ; but, even then, they will require every operative to declare that he is not connected with any society whose object is to regulate the rate of wages or business contracts between the employers and the employed, and that he will keep aloof from any such association while in the master's employment.

This is the case in its more prominent features. What is to come of the movement? It is unnecessary to argue whether ten hours' work is more than a man ought to perform daily. Very few who labour at all have shorter hours of occupation; but these are matters beside the question. Are the men to overcome the masters, or are the masters to overcome the men? The history of strikes is decidedly against the former alternative. So is the result of the strike among the London gasmen a few weeks ago. If it be possible to conceive any manufactured article, excepting bread, whose deprivation, even for a day, would be absolutely intolerable, it surely is the gas-light of the English metropolis. Yet the gas-men have succumbed. In a fair fight, the masters must prevail, unless we are to revolutionise the maxim of experience. In alluding to the course which the employers have thought fit to adopt, we frankly own that we have put the case in the light most favourable for them. There are those who condemn them, and we are not acquitting them of all blame ourselves. For instance, it would be hard to defend in them the very practice which they condemn in others—these others being less capable of forming a sound judgment. It is entirely too arbitrary in the employers to interdict all co-operation among their workmen, while they themselves are a living illustration of a counter co-operation in its most aggravated phase. They plead the necessities of their position, and proclaim their wish to recognise the independent action of each individual workman. Is it not striking at the foundation of this independence to prohibit him from all trade communication or friendly counsel with his fellows? This, we think, is a well-nigh indefensible stretch of authority on the part of the employers. But, whatever faults the masters may have committed, the men are ten times more culpable. Perhaps, instead of the "men," generally, we should say, the "leaders." Strikes are generally got up by a handful of hair-brained, half-educated workmen, drunk with enthusiasm or something more appreciable—fellows with a profuse capacity for taproom speech-making and workshop laziness—men who either enjoy a secure situation themselves, or who are merely reckless birds of passage, flitting from one town to another. and ready to leave when the place becomes too hot to hold them. The cause of strikes is really the inordinate vanity of individuals like these, who lose their head with the idea of playing the small demagogue, and who operate on men more ignorant and less dishonest than themselves, and drilled into the insane habit of looking on their employers as their natural enemies. These clever, but totally unprincipled persons —we are not now particularising the London strike—are the bane and curse of workmen. They would paralyse individual energy, make it imperative on the master to pay the good and bad workman alike, and they would sacrifice the happiness of their dupes, and the wives and children of their dupes, rather than forego a series of pothouse ovations as the eloquent denouncers of monied tyranny. If these deceived and infatuated operatives persist in their strike, they will lose their character, their self-respect will follow, they will see their wives and children struggling with starvation, they will be maddened into the commission of riotous acts, bringing them within the grasp of the law, and the law owes it inexorably to society to award them a measure of justice but little tempered with mercy.—*Derry Journal.*

SIR JOSEPH PAXTON.—Sir Joseph Paxton was born at the farm of Manderston Mains, in Berwickshire, on the 16th of April, 1804. At an early age he was apprenticed to a gardener. In 1820 we find him working in a garden, situated in the Duke of Devonshire's villa at Chiswick, the future knight receiving only twelve shillings a week for his labour. Having quarrelled with a fellow workman, he was dismissed from his humble situation. Standing one day near the duke's garden gate, his grace accosted him, and perceiving from the intelligence and smartness of young Paxton that he possessed merits superior to most of his class, he condescendingly invited him to call next day at Devonshire House. The result of his interview with the duke was his appointment at Chatsworth, his grace's seat, Derbyshire. The genius of Paxton soon made itself evident by the improvements he carried out in the Eden committed to his care. It had seemed perfect before, but his refined taste and correct judgment were needed to make it what it now is. He at once rose to the head of his profession. He wrote several treatises on horticulture, published a monthly magazine on botany, and contributed largely to the celebrated works of Mr. Loudon. Sir Joseph's fame as a horticulturist and as an author has been outshone and eclipsed by his last mental effort—the wonderful palace in Hyde Park. This has made his name known over all the earth ; and it is to be hoped that other opportunities will arise to give public employment to the great faculties he possesses.

STATE OF THE LIFFEY—SEWERAGE OF THE CITY.

AT a recent meeting of our corporation in reference to a report from Committee No. 1, for confirmation, recommending the acceptance of contracts for the building of sewers, Mr. Martin, Trinity Ward, called attention to the state of the Liffey, which was daily becoming more obnoxious, and bid fair in a short time to be as bad as the Thames. Since the Corporation came into power £8,000 had been expended by them in sewerage operations, which, in fact, made the Liffey worse and worse as they proceeded. For the last few years the Ballast Board had not sent lighters to dredge the river, and at present when a vessel came to the quay she was up to the main chains in mud. He alluded to the successful drainage of sewerage matter in Paris and other places (a subject fully treated in recent articles in "THE DUBLIN BUILDER") and directed attention to the circumstance of Mr. Neville, the borough engineer, having in 1853, given them a plan of "intercepting sewers," the system of which was admirable, and would, if carried out, remedy the disagreeable condition of the Liffey. If the sewerage of the city was conveyed to Sir John Rogerson's-quay, and swept thence out to sea, people might bathe in the Liffey instead of their having a corrupted and malarious stream. The "intercepting sewers" were, at this state of things, absolutely necessary, and feeling the importance of the matter he had handed in, as an addition to the report, the following:—"That in passing this report, the council recommends Committee No. 1 to commence as soon as possible the formation of intercepting sewers recommended by Mr. Neville, in 1853, and until these sewers were completed to postpone the formation of street sewers. What he proposed was, that the council should expend £8,000—£4,000 on each side of the city—on these intercepting sewers, before they expended any further sums on street sewers.

Mr. Whelan proposed that the standard height of three feet three inches for the sewers be enlarged to four feet, in order that the sewers might be capable of proper cleansing. Mr. Martin had attributed the merit of intercepting main trunk sewers to Mr. Neville. Now the fact was, the plan was Nimmo's, and he (Mr. Whelan) stated so four years ago.

Mr. Whelan said Nimmo's plan was to have intercepting lines of sewers discharging their contents into reservoirs at the ends of the north and south quays, there to be deodorised by Sir William Burnett's deodorising fluid, and then to be conveyed to the canals for manure. With respect to the height of the sewers—three feet three inches—it was stated before the committee that a man sent into one of the sewers to cleanse it had to be dug out. The sewer had to be broken open to enable the man to escape from it, and he (Mr. Whelan) witnessed the cleansing of a three feet three inch sewer in High-street, and he saw the man who was cleansing it nearly as paralyzed in his working as if he were in a coffin. If it were cruelty to send climbing boys into chimneys, it was just as great cruelty to send an able-bodied man into a three feet three inch sewer. The flagrant error in the height of the sewers was persisted in and carried out upon the same conservative principles which already cost the citizens so many thousands of pounds—all of which was done to maintain ascendancy in mechanical as well as political operations. The difference in cost to make the sewers of a really useful and permanent character, would be only 1s. 6d. per yard on the 4-inch wall, and 2s. 6d. per yard on the 9-inch wall sewer contracted for. Under these circumstances he begged to move that the sewers be increased in height to four feet.

Alderman Roe said that the Ballast Board dredged the river that year just the same as they did the preceding years. While recognising the importance of the subject of intercepting sewers, he could not help observing that the estimates of the costs of these sewers should be received with great caution, and, indeed, he believed that the real cost of these would far exceed £40,000 (hear, hear.) As to the health of the city, it never was in a more satisfactory state than at present. Owing to the very hot weather, the effluvium from the Liffey was greater than previous years, nevertheless, it was not considered by the citizens as a very great grievance. When the sewerage operations of the council were fully completed, the sanitary condition of the city would be all that could be desired (hear, hear).

Mr. Martin, Trinity Ward, in seconding the amendment of Mr. Whelan, said the present height of the sewer was an outrage on common sense. Messrs. Whelan, Kelly, and French, three of the most practical men in the corporation, were of that opinion.

The Lord Mayor, Mr. Redmond, and other members of the council were of opinion that Mr. Whelan's amendment, if it was carried, would stop works and necessitate new tenders and new contracts.

Mr. Whelan said the non-adoption of the amendment would show that the council preferred rather to persevere in an error than correct it.

The Lord Mayor submitted the amendment to the council, and it was negatived.

THE TURKISH BATHS IN LINCOLN-PLACE.

The Oriental system of "hot air baths" is not entirely unknown in Ireland, for there are sweating houses, as familiarly termed, at Rathlin, at Mount Keeper, in the county of Tipperary, and again on the borders of Fermanagh and Leitrim, as well as others of a recent date; but we Dubliners generally are taken by surprise at seeing the system proposed to be carried out on such an extensive scale as in the building to which we allude, and many enquiries are made as to its purpose. For some months past the west side of Lincoln-place has presented a busy scene, and in a comparatively short time a structure of important and uncommon character has risen under the auspices of a public company which proposes to carry out the Oriental system if not in its grandeur at least in its entirety as regards the principle, which is briefly this:—The bather or patient first enters the divan, which is a general apartment fitted with dressing stalls, where he denudes himself, and thence to the *tepidarium*, another apartment adjoining same, and heated to a certain temperature. Remaining there for a short time preparatory to incurring a much higher temperature, he proceeds to the vapour bath apartment until he begins to perspire copiously, where he plunges into a cold water bath immediately adjoining, and the attendants perform the shampooing or gentle kneading of the muscles to accelerate the flow of perspiration, thence he returns to the tepidarium and divan, and the bath is over. At first the operation is probably a trying one, but custom constitutes it a luxury, and we are told by Drs. Watson and Erasmus Wilson that "cases are on record of persons entering ovens sufficiently heated to cook beefsteaks and other articles of food which they took in along with them. A hot air bath is said to be not comfortably warm at ninety-eight degrees, and anything lower will be rather hurtful than otherwise. The new building, Lincoln-place, has a frontage of about 186 feet, and the main entrance to the male and female baths are centrally situated, and commuuicate with a ticket office, and the respective corridors and apartments intended for both sexes. There are four divans of various sizes with the tepidaria and vapour baths as above described off same. At the end next Leinster-street there is a spacious saloon in course of erection, which we understand will be fitted in handsome style. On the second floor in central building will be situated the board-room to which spacious staircases lead, and above which will be an ogee-shaped dome, rising to a height of some fifty feet. A large apartment, with separate entrance, is provided for the application of the system to horses and other animals. Externally the elevation presents a quaint but pleasing appearance with its many narrow pilasters, half-moon apertures, fretwork ornamental minarets, &c., &c., though not quite orthodox as regards architectural principles; and in the rere of central building rises to a height of about eighty feet, the ventilating shaft intended to carry off the heated air which passes from hypocausts horizontally under the doors of the apartments, in extent equivalent to the required temperature. Mr. Barter, of Cork, is the designer; Mr. Dwyer, the Clerk of Works; Messrs. Hogan and Son, the plasterers.

NEW CHURCH OF ST. AUGUSTINE, GALWAY.

This edifice, for some time in progress of erection, was solemnly dedicated on the 28th ultimo. The plans have been given by Mr. B. Moran, architect, Dublin. The clergymen of the order have been themselves the builders. The design is early English, and consists of nave, aisles, chancel, and side chapels. The aisles are separated from the nave by an arcade of seven arches of equilateral form, with octagon piers of highly polished marble, surmounted with moulded capitals of the same material, which form a novel and striking feature in the building. The chancel is lighted by a traceried window in three bays, the nave by a triple lancet in front, and clerestory, single lights. It is open in front, and supported by four pillars of green veined marble, with capitols of Carrara marble. The slab is of pure Carrara, 9 feet 6 inches in length by 4 feet wide. The steps and landing are of highly-polished Galway marble. The roof consists of framed principals of open timber. Inside the grand entrance of the church is placed a holy water font of black marble, designed in the Ionic order (?) and executed by a Galway artist, Mr. Clare; it is probably one of the most splendid in any church in the United Kingdom.

THERAPEUTIC ESTABLISHMENTS—THEIR PLACE AND POWER.

Although every Englishman may be prepared to make a castle of his house in time of need, yet it would be hard to persuade those experienced in military matters, that the national defences are not more to be relied upon, when properly fortified buildings are erected in suitable positions throughout the country. In like manner, we are not to suppose, that we can dispense with public establishments for the sick because ordinary dwellings can be made to supply their place on emergencies, and because in many instances domestic comforts surpass any arrangements that ingenuity can devise for the accommodation of invalids on a great scale. For when we come to consider the actual state of things, we find that in far the largest number of cases in which persons afflicted with severe diseases are treated at home, many appliances are wanting at the time when they would be most useful, and many important remedies cannot be employed, owing to local circumstances or peculiarities of the construction and arrangement of the different apartments in private houses. In other words, the physician has to consider two separate things in his private practice, first, the interest of his patient, and secondly the safety and comfort of his friends and fellow inmates. But in a public establishment all arrangements are made to tend to the one goal—the recovery of the sick. And in hospitals for the poor a multitude of conveniences are to be had which would otherwise be quite unattainable by the class of persons who now obtain the benefit of these benevolent institutions. In fact this is so obvious that any remarks in proof of it would almost seem to be superfluous. When to the advantages of diet and medicine are added the constant superintendence of experienced physicians, besides many other advantages, there is no difficulty in understanding why the poor so readily avail themselves of the benefits which are to be derived from temporary residence in our large public hospitals. The reasons why public baths and wash-houses should be well attended by the poor, are also many and convincing, more particularly as their own dwellings are so wretchedly defective in every kind of convenience for the performance of ablution, or for the frequent washing of clothes or bed-linen. The poverty of the poor may be considered by some a sufficient reason why *they* should resort to public hospitals, where they are maintained in idleness at the expense of the state. But the fact is, that there is no class of society which may not derive benefit from residence in establishments specially constructed with a view to hygienic principles; and provided with accommodations suitable to the rank and station to which they have been accustomed. There is an establishment in this city, intended to supply this want amongst the middle classes, and into which both medical, surgical, and fever cases are admitted, and there is no doubt that it supplies a great want in the community; but it must be obvious that its intra-mural position places it under great disadvantages as a health-resort for those who can afford to get into the country. If it does not meet with the most unequivocal support of the public, it must be because the majority of patients in the upper and middle classes are able to provide themselves elsewhere with as good accommodation in more salubrious localities. The watchful observer of passing events may, I think, discern symptoms of a disposition in the public to avail themselves of hygienic influences, whenever they can do so without going to a great distance, or incurring unreasonable expense; and there can be no doubt that a great public want is supplied by the construction of health homes, or "Maisons de Sante," in the vicinity of all large towns, or in such situations as may be best suited for the recovery of the sick. Such institutions are already in existence under the name of hydropathic establishments, but they are generally at a distance from cities, and difficult of access for those who are really very ill; so that those who do go to them have not the advantage of medical or surgical consultations with practitioners of eminence, and many are unable to get to them, who would be really benefited by the change of scene and judicious regimen, which are so essential in the treatment of chronic disease. At present there are few establishments in existence where a patient actually obtains the full benefit of the entire progress which has lately been made in the healing art. The true vocation of a physician being the healing of the sick, it would seem absurd to restrict him in the employment of any natural remedy which he may think advisable, or particularly suited to any individual case, but such is the perversity of the human mind, that every physician is expected to range himself under the banner of some medical sect (more or less exclusive), and to deprive his patients of all remedies which may not be considered suitable by his self-appointed judges. One party cries, "There is no principle in medicine, but 'similia similibus curantur,' and Hahnemann is the prophet thereof." Another says, if you wish to be considered a *legitimate practitioner*, you must prescribe medicine in every case which you are consulted about, or what would become of the poor apothecaries? Another has no respect for any poisonous drugs whatever, despises opium, hates epsom salts, and abominates rhubarb and colocynth. Some sober-minded persons have been known to express a wish, that the man who dares to draw blood, put on a blister, may henceforth be punished for his cruel temerity. Then again, we have Mesmer saying of his art, "Il n'y a qu'une maladie, par conséquent qu'un remède." Now, in the name of common sense, why should there be anything utopian in the idea of uniting the scattered elements of therapeutics, and ranging them all under the banner of Esculapius? Why should the valuable baths of the hydropathist be placed in opposition to "the blest infusion that dwell in vegetives?" Or why should party spirit be allowed to deprive suffering humanity of *any* means of relief which is not opposed to the laws of God, or the interests of society? Let us hope that a better day is approaching, when we shall see that physician honoured, who maintains the dignity of his profession by his diligence in the use of *all* the means which are placed in his hands by Providence, and who, while he sets a high value upon the esteem of his professional brethren, is ever willing to forego it, when it tends to lessen his usefulness, or lead him from the path of duty which he knows he ought to pursue. It is to be hoped that the day is not far distant, when we shall see splendid *buildings* devoted to the treatment of the upper classes, by many methods now unattainable in their own houses; and that by their means chronic diseases will cease to be so much the "opprobrium medicinæ," as they undoubtedly are at present. The old complaint of the house being "*turned upside down*," by the energetic physician, need then be heard no longer; as "all appliances and means of art" might be obtained in a few hours at the most, by means of those wonderful time-annihilating machines which bear us from place to place with magic speed, rendering noisy homage as they roll, to the genius of Watt and Stephenson.

COMBINATIONS AND THEIR CONSEQUENCES.

We cannot contemplate the present condition of society without coming to the conclusion that much is defective in our social arrangements, at least so far as regards the great body of our people, the working classes. A vast majority of them are left uneducated, exposed to all the dangers and evils of ignorance, to ceaseless toil and hopeless poverty. Many of all classes find it next to impossible even to find an opportunity of labouring for their sustenance. We hear daily of the countless numbers who seek appointments to every vacant office. In many of the fields of labour this superabundance of numbers or surplus of labour beyond the demand, has led to the gradual lowering of the rate of wages to a point such that the possibility of earning sufficient to procure the necessaries of life has become impracticable, and employment, even at that price, is in many instances a matter of favour. This peculiarly applies to females. Some years ago the spinning-wheel gave employment to a large number of the female portion of the community. Then it was possible to procure an article that truly deserved the name of linen, a matter which we deem completely impossible in the present day. Spinning-mills have now entirely superseded the spinning-wheel, and very many spinsters are obliged to take the miserable wages offered by the muslin manufacturers, or in many cases do worse. Competition amongst manufacturers has reduced the wages for this description of labour to the starving point, and we are informed that much injustice is often practised by the managers in fining the unfortunate workers, without sufficient cause, who are obliged to toil for whatever they can get for their labour. It is almost superfluous to repeat what has been so often said and admitted as an axiom—that labour is subjected to the same laws as any other article of commerce, and its value regulated by the same laws of supply and demand. Its value may be bolstered up by adventitious supports for a time; it must, however, ultimately find its level. The tendency, too, on every side for the substitution of machinery for manual labour should be a warning to all who have labour to sell, to be content with a fair market-price for it. In many cases, combinations and strikes have resulted in the application of machinery, which superseded, in a great measure, the re-employment of those with whom their employers had found it so difficult to deal. In all cases it is the duty of the government to provide that the labour-market be free; each to sell, and each to purchase, in the most mutually advantageous manner. Combinations either to depress or advance wages should be rigorously put down just in the same manner as combinations to raise the price of food, or inflict any other evil on the community at large. On the other hand, every individual should have perfect liberty to sell his labour to the greatest advantage, and in whatever market he pleases. Industry and excellence should meet with suitable reward, and the system of a common rate of wages for all the individuals of one trade should be abandoned, and all employers left free to pay each man the value of his labour, as agreed upon between themselves, subject to no control from others. In the present strike of the building trades in London, a very few weeks will show the folly of the attempt at dictation, and the misery and utter ruin which must inevitably fall on thousands. A delay of six months in the completion of the works now in hands by the builders will neither ruin them nor the owners of those works, but must inevitably ruin a great number of the operatives, and leave them entirely at the mercy of their employers; we warn them, then, to make all reasonable concessions to their employers, and terminate, at the very earliest possible moment, this unnatural contest. If nine hours' work be thought by any individual to be sufficient for his constitution, let him and his employer regulate the matter privately; and if others feel that they are able to work twelve hours in the day, and that the demands of their family require it, let no man or body of men be permitted to step in between this man and his employer for the purpose of dictating what their private agreement may or may not be. The tendency in man to convert every good into an evil by abusing it, is evidenced by the opportunity taken of converting benefit societies, young men's improvement societies, &c., to evil purposes, purposes not embraced in their constitution, and always kept hidden at their establishment. It cannot by any means follow, that giving up being a member of a society to regulate the hours and price of labour, also necessitates giving up membership with a society instituted for other objects—to assist each other in sickness, or to provide means for interring the dead. We cannot see any necessary connection between those objects, but we can see that the union formed for one purpose has been diverted to others by designing men, and those purposes being entirely at variance with the constitution of our country, which secures to every man the right to use his own labour in such manner as he may desire. And the right assumed by any body of tradesmen to say to a man, "You shall not work at our trade unless you have our permission." This would be an *imperium in imperio* which no government could tolerate. We call, then, on the rulers of our country to secure, as far as possible, to every man in it the free exercise of his rights; and we call on the men of the united building trades to abandon forthwith their suicidal combinations, which are only working their own ruin, and will eventually bring matters into a much worse state than when the strike was commenced. This will be effected in various ways. Individually and collectively, great pecuniary loss will be sustained, consequently, all will be in a more dependent state, because all are *pavre*. Large numbers of men will be gathered into the metropolis from country towns, in spite of all the efforts which may be made to prevent such a thing from taking place; the majority of those will remain in London when the wages is higher than in the places from whence they came, thus increasing the quantity of labour, which is stated to be already superabundant. This will lead to a fall in wages, and the necessity of overtime when it can be got to bring the wages up to the demands of the family. But even if a higher rate of wages could be maintained, it would have a tendency to lessen the amount of work by lessening the desire to build, which being able to do at a moderate price frequently induces.

Viewing the matter in whatever light we will, we feel convinced that the war which has been declared by the operatives against their employers can in no way benefit the former, but on the contrary injure them in many ways; and again we advise them, as their ardent well-wisher, to make peace at the earliest possible moment, and for the future restrict their societies to more legitimate objects than regulating the value of labour, which even the legislation of the country itself would not attempt.

M.

THE ARCHITECTURAL UNION COMPANY.

During a recent visit to the English metropolis, we had an opportunity of inspecting the beautiful collection of architectural models, materials, appliances, &c., displayed at the new and magnificent galleries of this company at Conduit-street, and we should recommend all who probably may pass that way, and who take any interest in matters of art, not to fail to enter the doors, so liberally opened gratuitously for public pleasure and instruction. Amongst the many exhibitors we may without invidiousness to others of excellence, particularise the well-known names of Messrs. Hart and Sons, Wych-street, Strand, eminent medieval iron and brass manufacturers, who exhibit some very beautiful ecclesiastical and domestic furniture, ornaments, &c.; Messrs. White and Parlby, of Great Marylebone-street, and Messrs. Jackson and Sons, of Rathbone-place, Carton Pierre and Co., papier machie manufacturers; Hobbs, Ashley and Co., and Chubbs in the lock department; George Jennings in sanitary appliances; Messrs. Arrowsmith of Bond-street, in parquetrie; F. Ransome, J. Cumberland Part, proprietor of Martin's patent cement, the Architectural Pottery Company, Poole, in artificial stones, cements, and pottery; and in the latter department, Messrs. Minton, Hollins, and Co., have contributed an excellent display of their encaustic pavements; Messrs. Hayward, Tyler, and Co., of Upper Whitecross-street, engineers, brassfounders, &c., and several others occupy prominent positions in their respective departments; and, on the whole, the exhibition is most attractive, and during its temporary existence may be fairly classed amongst the London sights.

NATIONAL SCHOOLS.

The Commissioners of National Education report, that in consequence of representations made to them of the necessity for increased accommodation at the royal schools of Enniskillen and Dungannon, they have within the past year expended considerable sums in making improvements in the buildings of those endowments, and that they have also undertaken such repairs and alterations as their funds would permit at the royal schools of Armagh, Banagher, and Cavan; and they further report that all these establishments may be considered as in a very satisfactory condition. With reference to the diocesan schools and school-houses, the commissioners report that these schools and houses continue in the same unsatisfactory state as they have from time to time felt it their duty to bring under the attention of the executive government. The estates which form the subject of the endowments of the respective royal schools are in a much more satisfactory condition than heretofore, especially that of Enniskillen, where the commissioners hope soon to be able to establish another school for the benefit of the children of the tenantry.

CHEAP MODES OF BUILDING WHERE STONE AND BRICK ARE DEAR.

At La Fayette, on the banks of the Wabush, United States, where there is abundance of sand and gravel, and no quarries or brick-clay, many of the factories, stores, and houses are built of lime, sand, and gravel, mixed together with water in a large wooden box, about five feet square and two and a-half deep. This grout or liquid mortar is carried and poured between two boards, the width of the wall, these being about twelve feet long, eighteen inches wide, and one inch thick, screwed together to the width required, and unscrewed when the grout hardens, generally in a day. By having several boards the work can be carried on by many hands; the window and door-frames are put in the work; the plummet and line must be often used. The two first courses over the ground about eighteen or twenty-four inches, are of mason work, the rest being done by laborers. Continuous walls can be built very cheaply and rapidly, the men soon getting accustomed to it.

In Staten Island several Elizabethan cottages and villas are built of flags on ends, which present a smooth front, equal to cut stone. Our Irish builders might take a hint from this.

LABOURERS' DWELLINGS.

We observe with much pleasure an article on this subject, which appears in the Transactions of the Highland and Agricultural Society of Scotland for July last, being a further account of an experiment made long since, in 1814, to provide comfortable habitations for the farm laborers and mechanics required on the extensive estate of Annandale in Dumfriesshire, the property of J. J. Hope Johnston, Esq., by the agent of the estate, C. Steward, Esq.

This estate comprises some 14,000 acres, and the cottages, 110 in number, are situated on dry land and in a cheerful situation, as separate dwellings, along some twenty miles of a turnpike road which traverses the estate, as well as the cross roads by which it is intersected. The arangements under which they were built were very peculiar. The site of a cottage was let at a rent of £5 per annum, to such, being respectable persons, as chose to build on a lease of nineteen years. Mr. Johnston supplied timber, of which the estate produces abundance, having it sawn, and also the freestone for lintels, door-sills, &c., the value of both being about £20; the outlay on the part of the tenant varying from about £20 for the smallest to £35 for the best of the cottages. The cottages are occupied subject to a proviso, that Mr. Johnston may resume them at any time on giving six months' notice, and paying the tenant for his outlay; but this clause in the agreement is merely precautionary, and has scarcely in any case been acted on. At the conclusion of the lease, the house becomes the property of the landlord, and many of them, the leases of which have expired, are relet to the original occupants, their widows or children, at rents varying from 40s. to 50s. per annum. The tenants of some seventy of these cottages have obtained the privilege of grazing a cow in the adjoining field, or of having from three to six acres of land attached to each cottage, for either of which they pay, with great punctuality and thankfulness, rather a higher rent than could be obtained for the same land if let in bulk to a solvent tenant; and nearly fifty years' experience of this mode of arrangement has only tended to prove the wisdom in which it originated. Appended to the report are some observations on the working of the plan by the Rev. Mr. Hope, the clergyman of the district, the perusal of which we feel assured will afford great satisfaction to the many excellent men who are at present using their best efforts to effect similar results in this country.—*Agricultural Review.*

THE NINE HOURS' MOVEMENT.

Sir Charles Fox addressed a letter recently to the *Times* worthy the attention of *our* employers, to the effect, that "for many years the late firm of Fox, Henderson and Co. allowed their men at the Birmingham establishment to leave off work at two o'clock on Saturdays, which, of *itself was accepted as a very great boon*, but greatly enhanced by the wages having been previously paid, so that nothing remained at that hour but to return at once to their families, with the afternoon before them for improvement and recreation." Further, "that great care was taken in paying the men so as not unnecessarily to encroach upon their time, and the operation with 1,000 men was usually performed within half-an-hour; and during the construction of the Exhibition building of 1851, 2,500 men were often paid in forty minutes." Sir Charles expressed his belief that had this system been generally adopted we should have heard nothing of the nine hours' movement.

Biographical Sketches.

THOMAS COOLEY.

Thomas Cooley, another of the celebrated architects to whom the architectural ornamentation of Dublin owes so much, was an Englishman, and served his time to Reynolds, a carpenter. He was originally brought to Dublin, in 1769, by the committee of merchants who offered premiums for designs for the Royal Exchange, when that by Cooley was selected from sixty-one sent in on that occasion. He received the premium of one hundred guineas, and was appointed to erect the building, which was opened 1st January, 1779, at a cost of £40,000. It has been usually considered as, perhaps, the most elegant structure of its kind in Europe, and for unity of design it is not surpassed by many later and more important structures, whether at home or abroad. The three fronts, of Portland stone, each nearly 100 feet in length, are enriched with columns and pilasters of the Corinthian order. The interior possesses a square saloon formed into a circular shape by twelve fluted columns of the composite order, thirty-two feet high, which is lit by a lantern having a corresponding number of circular windows; over this is a dome lighted from the centre. This saloon communicates with rooms around, appropriated to the various purposes for which the edifice was designed. It may not be generally known that this building has the advantage over many others in this city, of being founded on the rock which extends along Parliament-street, under Essex-bridge, to Liffey-street.

About 1770 he commenced, for the Primate Robinson, the central tower of Armagh Cathedral, which, after being raised 60 feet above the roof, was taken down in consequence of the yielding of the ancient piers. In the Phœnix Park he built the little chapel, and from 1768 to 1773 he was engaged in the erection of the Hibernian Marine Schools, on Sir John Rogerson's-quay, at an expense of £6,600. The design is, however, sometimes attributed to Thomas Ivory. The centre building is 72 feet by 46 feet, and the wings, which are each 30 feet in front and 60 feet in depth, recede from the quay; the whole forms a plain, but not inelegant stone structure. Some additions were made at the beginning of the present century, under the direction of Mr. Parke. The prison called Newgate also engaged his attention from 1773 to 1780; the expense was £16,000, which, for a building 170 feet in front, 127 feet in depth, and three storeys in height, is a comparatively small amount. This may account for "its insufficient extent, bad arrangement, and wretched execution, the materials and workmanship being of the worst description"—an observation applied to the building by an esteemed author. The Record Offices or Four Courts was the work in which he was interrupted by his death, at the early age of 44 years, caused by a bilious fever, in 1784; his residence at that time was in Anglesea-street. These courts of law were commenced in 1776, the western wing, with its south façade, being the only portion erected by Cooley, at a cost of £16,788; he was succeeded by Gandon, whose biography we have given in the two last numbers. Cooley's style of architecture was an imitation of that of Inigo Jones, but he did not always succeed as well as his great model. We are chiefly indebted to *Whitelaw and Walsh's History of Dublin* for these particulars.

JOHN AHERON.

"John Aheron is the signature to a manuscript, executed in imitation of type printing, now in the British Museum, London (Bib. Reg. 282-273 E), entitled *A General Treatise on Architecture, divided into Five Books, &c.* It consists of 176 folio pages, with the epigraph, 'This work was written and drawn with pen and ink, and finished the 13th of April, A.D. 1751, by John Aheron.' The author seems to have practised in Ireland, as three of the drawings relate to houses in that country, and a partially experienced eye can discern in the erasures at the end of the preface, the words 'Sir Edward O'Brien, Baronet –Dromoland.' This gentleman, apparently an early patron, was to have been highly complimented for his architectural designs, and for his improvements on that estate in the County Clare. The only other address in the work is that of Poole Crosby, Esq., attached to a design for the east front of Stradbally Hall, in Queen's County. The drawings, some of which exhibit vast buildings (one bearing the date 1743), show great superiority over the general designs of that period, and the text is well selected and arranged."

Such is the notice appended to this name in the Dictionary of Architecture, now being issued in London by the Architectural Publication Society, and we are obliged to the committee for thus rescuing the name from entire oblivion. Should any of our readers possess any information relative to Aheron, O'Brien, or Crosby, from which some clue could be derived as to the professional reputation of this Irish architect, as we may presume him to have been, we shall gladly give insertion to the observations.

Any information also respecting George Ensor, architect of the Rotundo, Dublin, will be gladly received.

THOMAS IVORY.

Thomas Ivory was self educated; the only monument of his ability in architecture is the King's Hospital, best known as the Blue Coat Hospital, on Oxmantown Green, near this city. The first stone was laid 16th June, 1773, and the building opened about 1777. It consists of a centre and wings, extending 300 feet, and connected with each other in the rear by subordinate buildings. The centre pile, 87 feet long, 58 feet wide, and 43 feet high, is of the Ionic order, and was intended to have been surmounted by a steeple or clock-tower, but was not completed. The original drawings, by Mr. Ivory, hung in the board-room, show the original intentions of the architect, which were then, as now, so often frustrated for want of means. In the account of this building, published in 1818, we may add, that "there have been lately furnished to the dormitories 75 double bedsteads of hammered iron, in place of the wooden bedsteads which were formerly used and found productive of vermin;" so that our modern iron bedsteads are not quite so new in idea as usually thought.

Up to about 1805, £21,294 appear to have been spent upon the building, which was intended to accommodate 300 boys, and it remained in the same state many years.

The Hibernian Marine Schools are sometimes attributed to Ivory, but most probably the architect of them was Thomas Cooley. For some years he held the office of master of the architectural school of the Royal Dublin Society. He died in Dublin in 1786.

Notes of New Works.

The new convent and schools at Omagh are stated to be progressing rapidly. Mr. J. Neville, architect; Mr. W. Doolin, the builder.

The first stone of the church of St. Patrick, Mayo Bridge, was laid recently. It is to be in the Gothic style, and will accommodate 1,400 persons. Expenditure, £3,000. Mr. John Murray, of Dundalk, the architect; Mr. M'Gaughy, of Armagh, the builder.

The new parish church of Killursa, Headford, was consecrated last month.

The church of SS. Peter and Paul, Cork, has been commenced from designs by Mr. Pugin. Mr. Barry M'Mullen, the contractor.

The Towns Improvement Act is about to be extended to Fermoy. We wish its powers were available in many other towns in Ireland likewise.

The works between Athboy and Trim on the Dublin and Meath Railway are in active progress, four miles of the line being brought to formation level, upwards of two miles ballasted and ready for rails, and the public and farm road-bridges, culverts, &c., in course of completion. The total cost will not exceed £7,000 per mile. Sir John M'Neill, engineer in chief.

Estimates are required for repairs to the court-house at Ballina, to be lodged on 2nd instant.

The Ecclesiastical Commissioners are about having sundry works executed at the churches of Rathcormac, Co. Cork; Killesher, Co. Fermanagh; Currin and Inniskeen, Co. Monaghan; and Longfield Lower, Co. Tyrone.

The War Department will receive estimates up to 10th instant for the construction of a rifle range with shelter shed, at Newdown, near Mullingar, and up to 9th inst. for alterations and additions to the guard-house and cells at the old barracks, Fermoy.

The church of the Immaculate Conception, Bundoran, Sligo, was dedicated on the 15th ult.

The Board of Public Works are about erecting a district model national school at Enniscorthy, for which proposals will be received up to 19th instant.

A new Catholic church is to be built ot Lixnaw, Co. Kerry, according to plans and specifications by Mr. J. J. M'Carthy, R.H.A., architect.

It is proposed to erect a monument at Mount Jerome Cemetery to the memory of the late John Mitchel Kemble, the great Saxon scholar and antiquary.

A new church to accommodate about 500 people is to be built at Raheny, on a plot of ground immediately opposite the Protestant church, very favourably situated, and gratuitously presented by Mr. Moore. Plans have been submitted to the committee by an architect for a Gothic edifice giving the required accommodation.

It is proposed to erect workrooms for the Director of the Natural History Museum, in connection with the Royal Dublin Society, at a cost not exceeding £300.

A manse is being erected in Ballinderry for the Presbyterian clergyman of that place. Mr. W. T. Matier, Belfast, architect; John Scott, builder.

The Roman Catholic church of St. Mary at Ballinrobe is to be completed. Tenders will be received up to 5th instant.

A new and handsome villa is being built at Timode, near Blessington, for W. H. F. Cogan, Esq., M.P. The area embraced is about 75 by 65 feet. The house is four storeys high, including basement, and with exception of the latter, which is in punched ashlar, is cemented externally. Mr. W. F. Caldbeck, architect; Mr. R. Farrell, builder Probable expenditure about £6,000.

At the National Gallery side of Leinster-lawn, workmen are engaged in building the flank wall of the house No. 8, Merrion-square, west (Dr. Lyons, proprietor) in which it is proposed to put two projecting timber oriels on the first floor. Mr. M'Carthy, architect; Mr. R. Farrell, builder. Expenditure about £800.

A new range of stabling of a very superior character, and in the castellated style of architecture, with embrasure parapets, lofty tower, &c., &c., is being built at Castleforbes, Longford, for the Earl of Granard. Mr. J. J. M'Carthy, architect; Mr. R. Farrell, builder. The outer walling is of punched stone in uncoursed ashlar work, and the dressings of limestone. Expenditure about £4,000.

Railway Items.

At the half-yearly meeting of the Belfast Junction Company a dividend of 4 per cent. was declared free of income tax, the same as preceding half-year—although the traffic exhibited an increase of £1,500, a higher rate of dividend could not be allowed. Progress was rapid in laying the double rails, and 39 miles were completed, 17 more nearly so; and the working expenses compared favourably, being only 36 per cent., against 49, the average of the Board of Trade returns.

The Dublin and Drogheda Railway Company have granted a dividend at the rate of 4¾ per cent., less income tax, an improvement of five shillings per cent. It is intended to aid, by subscription to preference shares as far as £20,000, the Dundalk and Enniskillen Company in the construction of their new branch from Clones to Cavan, a safe investment, as these preference shares are stated to be at a premium. This aid has been similarly extended by the Belfast Junction Company, so that this important extension will be actively prosecuted.

The Dundalk and Enniskillen held their half-yearly meeting, at which a small dividend, five shillings, was divided, leaving a balance of £400, and the traffic since the line has been extended to Enniskillen is highly assuring. A good deal of discussion arose in reference to excursion and Sunday trains, and we trust that the matter shall be duly considered. The meeting has been made special, to arrange to raise the capital required for the extension to Cavan.

The report of the Dublin and Wicklow Railway proprietors show a rapid progression in the traffic, and satisfactory agreement with the Kingstown board regarding the diversion of traffic. Several matters are at present in progress which will materially enhance the value of the property and develop the traffic of this beautiful line. There was some opposition to the mode proposed by the board for the settlement of the traffic question, but the amendment was withdrawn, and the original plan carried, whereby the directors will be relieved from restraint as to trains and fares.

The Dublin and Wicklow Railway Company have obtained the sanction of parliament for their extension to Gorey, which will, no doubt, be carried out with little delay. It will be of great advantage to several of the new mining projects, and these, whatever may be the results to the mining shareholders, will largely contribute to the revenue of the new line, which will eventually run on to Wexford, almost the only district near Dublin without a railway.

The Waterford and Limerick Company recommends a dividend of one per cent. on the original stock, and the company appears to be in a more healthy condition than it ever was before.

The construction of the Omagh and Dungannon line is being proceeded with, and the works at the Dungannon terminus are being pushed on with vigour.

Dublin and Meath Railway.—The contractors have been put into possession of a good part of the land necessary for the construction of the line between Kilmesson and Clonsilla, and made available to them through the kind and liberal interference of John Preston, Esq., of Ballinter. Every part of the line is now open to the contractors, and probably the direct communication between Meath and Dublin is in the very near prospective. The centres of the bridge at Bective are now being put up, and it will soon be finished.

Correspondence.

CORRESPONDENCE ON THE WATER SUPPLY.

Sir—In your number for this month you invite opinions upon the sewerage question, and as you go on to discuss the water supply in the same article, perhaps you will accept opinions on that also.

I incline to the opinion that an *airtight cesspool tank* for each house is the best and most useful method to get rid of night soil. But where is it to be placed? And how is it to be cleansed? Perhaps a law to compel the owner of every house to provide a receptacle in front wall or area, or in the rere of each house, in which a public company could place a tank suitable in size for the number of residents, fitted with couplings to the soil pipe or pipes, might prove effective. A company might find it profitable to provide tanks and machinery to remove them and replace them with empty tanks. Mr. Rogers's plan for separating water from night soil seems the best.

All are agreed that sewage matter should not be discharged into any part of a river as it flows through a town, whether the entire night soil be conveyed into the street sewers, or merely the water separated from night-soil. Intercepting sewers along the banks of the river to convey the entire sewage below and outside the town are essential to preserve the purity of the river. Here in Dublin we ought to have an intercepting sewer on the south bank of the Liffey from Watling-street to the mouth of the Dodder, large enough to take in the mill-stream at Watling-street and the Poddle; the proposed new water works may cut off the Poddle and so relieve the intercepting sewer from danger of an excess of water, meantime any excess could be carried off by an overplus sluice from the top of the sewer to the level of high water at the mouth of the Liffey, by which the excess of water would pass through an iron tube twenty feet broad on the face of the quay wall by two feet in depth, closed by an air-tight lid or valve which forced open by the flood in the sewer would give exit to a stream twenty feet broad by two feet in depth, which would soon bring the water in the sewer to the level of the tide outside. In the Blue Book Report of the General Board of Health of London, Appendix No. 2, page 132, will be found a diagram and evidence proving that sewage matter discharged from a sewer at ebb tide will be carried down ten miles, and that the flood tide will bring it back seven miles; if this be correct. the discharge from the intercepting sewer at the end of Sir John Rogerson's-quay will be carried out ten miles to sea, and cannot return within the Lighthouse, as that edifice is not three miles from the point of discharge.

Now, to flush this great intercepting sewer, and drive the filth effectually to sea, I propose to erect flood-gates across the river above Barrack Bridge, which shall close at top of tide and retain all the water up to Island-bridge, including the Cammack river, until half ebb, when sluices being opened into the intercepting sewers, the filth will be flushed out with such force as will, in my opinion, dredge the channel down to the Pigeon House, and save the Ballast Board the trouble and expense of dredging.

The intercepting sewer on the north side, as proposed by the city engineer, will turn from Eden quay into Beresford-place through Amiens-street, under the Drogheda Railway, under the canal by syphon, and discharge at the Gridiron Wharf, where there is a rushing ebb tide to carry the matter off. Two objections have been urged against this place of discharge—1st, the beach from Annesley-bridge to Dollymount will be spoiled. Answer.—That beach is already covered with slimy mud, which is increasing every year; if the discharge from the intercepting sewer would increase the deposit so rapidly as to justify the enclosure of the beach as profitable slob-land, so much the better, and the channel would be so narrowed, that it would afford a more rapid and effective scour. 2nd, the bathing-place at the Wharf will be spoiled. Answer—It can be replaced by safe and more convenient public floating baths in the Liffey between Barrack-bridge and Carlisle-bridge, the water of the Liffey will then be comparatively pure. as the crews of the ships discharge no more bilge-water and night-soil into the river than the canal boatmen *daily discharge into the water we drink.*

To separate night-soil from storm waters in ponds or otherwise at the mouths of intercepting sewers is utopian—the house tank is the only method to utilize it effectually. If you cannot utilize it, sweep it as far into the sea as possible.

With respect to the Water question, you seem to convey that the people of Dublin should stick to the canal water. First you state that a disagreeable fraud was practised by the Dublin Corporation in substituting metal pipes for wooden pipes. I think a great deal may be fairly said in favour of metal pipes, and against wooden pipes; but it is the malversation of the metal main tax of which I suppose you complain. The wording of your article does not convey that the present Corporation has no connexion with the old corrupt Corporation, except to pay the enormous debts which that body left to its successors; but you convey this, that as the Corporation defrauded the citizens, by praising Metal *v.* Wood, it may defraud them by praising River *v.* Canal—your words are as follows:—

"Just in the same way as the inhabitants are now being talked into the belief that canal water is bad, and that the water to be caught in the mountains of Dublin, flowing over the bogs and manured lands of the locality is good."

Now, I submit, that the present Corporation having a river partly belonging to the citizens, and which may be made to afford a full supply of better water than any in the canals, would be guilty of a dereliction of duty, if, yielding to the tactics of a wealthy body of canal stock owners, it bound the citizens to pay an enormous annual sum for canal water, when it is quite possible they can do without it altogether.

Referring to the comparison between canal water and Dodder water, the Royal canal is supplied from Lough Owel, which lake is formed by the drainage of seventy-four square miles of *manured* land with the sewage of the inhabitants thereon. Is not the summit level of the Grand Canal supplied from the *Bog* of Allen, and the *manured* lands adjacent? Where do the canal boatmen—2,000 in number—fling their slops and night-soil? They pump the bilge-water of their dung-boats into the canal. However, rich this latter may be as foods for plants, it is the quintessence of filth for human food. Finally, Doctor Ap~~john~~ tested the three waters, and proved the Dodder water superior to the other two.

Although I think it necessary to say this much in defence of the Corporation and the Dodder water, I am willing to agree to take some canal or other water, if a fair trial proves that the Dodder will not afford a sufficient supply. Urine will be urine, no matter how you filter it, but filtering may improve canal water when taken from a higher level than we get it at present.

There are 400,000 people in the county of Dublin; if all these were concentrated in the city and suburbs, twenty-five gallons of water for every adult and child in that number would require 10,000,000 gallons per diem. Now, Mr. Mallet, in his report to the Drainage Commissioners, 1844, shows clearly that nine and a-half square miles of the Dodder mountain catchment will yield 8,200,000 gallons per diem, beside which he states that the Dodder possesses altogether seventeen square miles of mountain catchment, and twenty-eight miles of plain catchment, from which I infer that at least 20,000,000 gallons per diem may be obtained from the Dodder. Mr. Neville, in his printed Report of April 3rd. 1853, states that he guaged the Poddle River at the tongue, and found that 1,500 cubic feet of water flowed through it every minute, and that he thought double that quantity flowed through it in flood-times—this gives thirteen and a-half millions of gallons per diem in ordinary, and twenty-seven millions of gallons in floods. But the Poddle water is only two-thirds of the water of the city water-course, so that the whole water is 20,250,000 gallons per diem in ordinary, or forty and a-half millions in floods. In his last printed Report of this year, he repeats his calculation that at nineteen inches rainfall the Dodder will yield more than twenty millions of gallons per diem.

With proper engineering, I believe the Dodder will more than amply supply the city, if not, then it will be time enough to try other sources.

John Martin, City Quay.

August 15, 1859.

BUILDERS' TENDERS.

Sir—Through the medium of your influential and deservedly popular journal, permit me to ask why is it when professional architects seek for tenders (probably desired information) from builders—who, to furnish same, are compelled to incur much trouble, loss of time, and occasional r.m.d. expense in purchasing quantities supplied, or in employing a measurer to take them out—that frequently a lengthened period elapses before any of the estimators, excepting the successful party, are made aware of the decision? Surely, sir, it would only be courtesy for architects, as a general practice, to notice each builder tendering of the result, and thereby relieve him from suspense, which, in the case of an expected large contract, may act detrimentally on his other business? and it is not too much to expect after the thankless business of estimating had been entered on. Or, if that course involve too much trouble, might they not furnish *you* with a list of tenders in each case, as is done without restraint to the London periodicals of a similar class, and through that channel give us the desired information. Your insertion of this will oblige

THE ATLANTIC TELEGRAPH CABLE.

TO THE EDITOR OF THE DUBLIN BUILDER.

Dear Sir—I beg leave to inform you, that I have discovered a plan by which Submarine Telegraphic Cables can be lowered to the greatest depths, or raised again, without allowing one-sixth the usual *strain* to come on the cable, but causing its weight to be supported (nearly) altogether on auxiliary cables attached to the ship, and so avoiding all danger of breaking the main cable, or the far greater danger of *overstraining* it, as was the case with the Atlantic cable, rendering it altogether useless in the course of a few weeks, as has been stated in the report of the five eminent electricians sent by the Atlantic Telegraph Company to inquire into the cause of its failure. The electricians gave as their opinion, after careful experiments and investigation, that *overstraining* in the process of submerging, by which the wires of the cable were forced through the gutta percha, thereby destroying the proper insulation of the copper wire, and allowing the water to leak through, was the cause of its ceasing to act; and this opinion was further strengthened by a report from the American side of the Atlantic describing another injury on it—about three or four hundred miles from their shore, where the water is about the same depth as where it is injured on the Irish side. Now, my plan is particularly required in the case of the Atlantic cable—for although there is a chain of mountains reaching nearly the whole way from Ireland to America, along the top of which the water is comparatively shallow, still there is a chasm of deep water at either end more than three miles in depth, and this has been found to be the place where the cable was *overstrained*, and consequently injured. Now, all that is required to restore the cable to perfect order is to splice a piece of new cable to it, across those two chasms, which is comparatively a very short distance. Lowering down the new piece of cable, of course without allowing the *strain* of its own weight to come on it in the operation—if not, no gutta percha can stand the weight of three miles of cable hanging from the ship to the bottom, and if the cable is not weighty enough to reach to the bottom, it is liable to be carried away by the ocean under-currents. Now, the particulars of my plan is as follows:—I first make an iron tube, say three feet long, of square shape, oblong, open at both ends. Into this tube I fix two iron bars of its length and two inches square; each one of the bars is securely fastened at the side, or, we may say, the bottom of the tube, when horizontal; the other bar is fixed to two strong levers, which press it firmly against the bar at the bottom, or raises it when required; if you pull the levers towards you, it forces the top bar against the bottom one, and any rope or chain that may be between them will be held fast; if you push the levers from you, they open and allow any rope or chain that may be between them to pass through freely. Now, to these levers I attach a strong rope of any required length, and also a weight; if you hold the tube now perpendicular, the weight will act on the levers so as to separate the iron bars, but if you haul on the rope you will close them, for the opposition of the weight of a few pounds is not much when there is tons, perhaps, on the rope; but if you let the rope slack, the weight acts and opens the tube; this tube I call the holdfast tube, and the rope I call the auxiliary cable. Now, if you take the shore-end of a submerged cable, and put the end of it through the holdfast tube, making the end of the cable fast to the shore again, let the holdfast tube run down to the bottom, the auxiliary cable allowed to run slack, then haul on the auxiliary cable, and it closes the bars on the submerged cable, with a force in proportion to the resistance it gives in coming to you. Suppose the ship now in deep water, say a mile deep, and that you let down three or four of these holdfast tubes in a similar way, the first one down to the bottom, the second within a quarter of a mile of the bottom, the third within half a mile, and the fourth within three quarters of a mile of the bottom, then haul on the four auxiliary cables simultaneously till the last one that went down comes to the surface, and you will have some idea of the weight or *strain* on the auxiliary cables, and consequently off the submerged cable Hold now the auxiliary cables of the three holdfast tubes nearest the ship taut, and let the one nearest the bottom slack, the weight on the lever of the holdfast tube then acts and separates the bars as before, and so allows the holdfast tube to run down again to the bottom; hold its auxiliary cable now taut, and let the second one slack, it will run down in the same way holding it taut. When it reaches within a quarter of a mile of the bottom, or some average distance, then the third, and so on, till they are lowered to their proper depths, ready to be hauled up again, and never allowing more weight to come on any part of the submerged cable, than the distance from one holdfast tube to the other, and as the holdfast tubes can be increased to any required extent, so can the weight on the submerged cable be reduced to any required extent.

I have so far shown the manner of hauling up the submerged cable without *straining*, I will now illustrate the manner of submerging it without *straining;* suppose we now haul on the four auxiliary cables that have been let down, and draw them and the submerged cable up until the last holdfast tube that went down comes to the surface, we have then one mile of the submerged cable resting on four auxiliary cables, each equal in strength to itself. Now, if we lower them gradually down together, same as they were hauled up, until the lowermost holdfast tube reaches the bottom, we have then one mile of the cable lowered one quarter of a mile without *strain.* If we hold the three auxiliary cables of the holdfast tubes nearest to the bottom taut, and let the one nearest the ship slack, the weight on the tubes' levers, as described before, separates the iron bars and allows the cable to pass through them freely. Now, if we had a small line fastened to the holdfast tube, but not to its lever, we could draw it up to the surface; then holding its auxiliary cable taut and letting slack the auxiliary cable of the holdfast tube next to it, and with the shifting line, we in the same way draw it up within a quarter of a mile of the one at the surface, the same with the next, and so on, until we have them all up to their proper place; they are then ready to be lowered another quarter of a mile or so to the bottom, then to recommence drawing them up separately to take a fresh load and go down. You now, perhaps, can understand the practicability of raising or lowering submerged cables without *straining.* Let us now suppose that there are four holdfast tubes in front of the ship, held by their auxiliary cables at equal distances from the bottom to within a quarter of a mile of the ship, and that there are four more holdfast tubes held by their auxiliary cables at equal distances from the stern of the ship to within a quarter of a mile of the bottom, if we now splice the auxiliary cable of the holdfast tube nearest to the bottom in front of the ship to the auxiliary cable of the holdfast tube nearest the ship at the stern, and also the others in the same manner, we will have the two operations, raising and lowering, performed at the same time, and with but a trifling power on the windlass; for, as the weight going down at the stern will be always equal to the weight coming up at the bow, to overcome the equilibrium is all that will be necessary, and the same will be the case in lifting one cable altogether into the ship, if we let another of equal weight out at the same time. The weight of the auxiliary cables themselves are not to be taken into account, as I propose to make them bouyant. I have thus described as clearly as I could, the practicability of repairing the Atlantic cable at a trifling cost, though in opposition to the wish and the arguments of those who make large profits by making new cables, and who therefore strive to stifle all notion of repairing old ones. I may here state, that when I made a set of models of my plan in March last, that demonstrates its utility, I wrote over to the secretary of the Atlantic Telegraph Company, and received no answer; I then wrote to the chairman, and was answered by the secretary, Mr. Saward, expressing a wish to see my plan, and promising to show it to the directors. I prepared to go to London without any other business but to show my plan to the directors; (for the securing my plan I could have done as well in Dublin), but how was I received? why, after several calls on Mr. Saward, I at last met him in his office along with Mr. Glasse, the contractor, I believe, that made the cable, and without asking to see my plan or show it to anyone, he told me in Mr. Glasse's presence that all matters concerning the cable were given over to Mr. Glasse, and referred me to him. Mr. Glasse repudiated the idea of my plan, or any other plan, he said, being of any use, and he left the office without seeing it. When he went out I opened my box and showed Mr. Saward one of my holdfast tubes in my hand, and explained to him its use; he admitted the thing looked rational, but said, as he was no engineer, his opinion was of no great value. While I was still in the office, Mr. Glasse returned; I then introduced my plan to him, and in the same manner explained the action of the holdfast tube, the weight and the auxiliary cable so clearly, that he was forced to admit that it would take the weight off the submerged cable, but denied that the Atlantic cable wanted any such assistance, as a stronger cable could not be made. I then referred to him the time that it broke; he shook his head, and said, he knew well how that was done, and left the office apparently excited, Mr. Saward having retired previously. Thus I had to return to Dublin, without seeing one director, shareholder, or other person having the slightest interest in the company, nor have I up to the present moment; so if you can give me any advice or assistance how to act, you will much oblige

Patrick M'Geale.

Review.

Wicke's Towers and Spires of England.

We have to acknowledge receipt of the third or supplementary volume of this beautiful work, and which, both in style, finish, and selections of valuable architectural morceaux, is fully equal to the two preceding. The illustrations are exquisitely executed by Messrs. Day and Son, London.

Every architect, archæologist, and lover of the beautiful in art should possess himself of the work complete.

Miscellaneous.

The Munster Model Farm.—The building of a covered farm-yard on an extensive scale, and of a school for thirty-two resident pupils, has just been completed at Cork, at a cost, for the former, of about £2,000, and for the latter, of about £5,000. The arrangements in both departments of the institution we consider very complete. The farm-steading contains both boxes and stalls for cattle, convenient and well-ventilated stables and piggeries, with compartments for calves and sheep, and covered manure pits and tanks, whereby the deterioration of manures, the bane of ordinary farming, will be completely obviated. The building devoted to the educational department contains a large and conveniently-furnished school-room, a dining-room, thirty-two sleeping apartments (one for each pupil), lavatory, kitchen, &c. There are also suitable suites of apartments for the agriculturist and the literary instructors. The farm, in the centre of which these buildings are erected, comprises 127 statute acres of good loam on a substratum of limestone gravel, resting on limestone. It has been in the occupation of the National Board since 1853. The rent is 34s. per acre, added to which the poor rates and county cess bring up the whole charge to about £2 per acre.—*Agricultural Review.*

Londonderry District Model National School. — This edifice is in progress of erection close to the County Infirmary, and is in the early English decorated style, with a frontage (looking eastward) of 208 feet, and a one-storey elevation in front, in the centre of which is a handsome porch. An oriel window in the master's apartments will also add considerably to the appearance of the building externally. The principal apartments consist of school-rooms for boys, girls, and infants, museum and library, drawing-room, class-room, maritime-school, lavatory, master's and mistress's apartments, master's office, dormitories, &c. The roof will be open. A corridor traverses the whole length of the building. The respective apartments will be lofty, well-lighted, and ventilated. The grounds comprise about three acres, and the site commands a beautiful view of the surrounding country. The grounds in the rere will be divided into gardens and play-grounds, and those in front will be laid out in walks and terraces planted with flowers and ornamental shrubs. The grounds are enclosed, and a neat gate-house will be erected at the approach. The work, it is understood, will involve an outlay of about £5.000. Messrs Boyd are the contractors, and Mr. Arthur Kent, the Clerk of Works.

Woodcuts by the Photographic Process.—This process is well adapted for copying engravings, &c, and a drawing may be transferred to wood by rendering the surface sensitive, and treating it nearly as if it were paper. Daguerreotype plates may be etched, but it is unfortunate that so delicate is the daguerreotype picture, if the etching be continued long enough to give a good impression on paper, some of the fine lines will run into each other. If, on the other hand, the etching is not continued so long, the printer, in cleaning the plate, will destroy it, and besides the particles of ink will be too large to express the details.

Whispering Galleries.—Sound, when reflected, follows the laws of perfectly elastic bodies making the angles of incadence and reflection equal. Reflected sound is called echo. The velocity of direct and reflected sound is the same. Sound may suffer reflection in such a way as to be concentrated to certain points at which it will be distinctly heard, though otherwise but slightly or not at all audible. This is the principle of whispering galleries, the most celebrated of which is in the dome of St. Paul's, at London. It is said likewise to be the principle of the hearing trumpet used by deaf persons; the sound received at the wider end is condensed and concentrated at the narrower, which is placed next the ear.

Firebricks.—The less lime in brick-clay the better for brick-making, but the less its value for agricultural purposes. When it contains only silex and alumina it forms very refractory bricks termed firebricks, such as those from Stourbridge. The Chinese are particularly careful in selecting, purifying, and intimately blending them. Defective materials may, however, to a certain extent be improved.

The Hogg Monument.—The funds for the construction of the Hogg monument are increasing with a rapidity which would seem to indicate the deep hold on the hearts of his countrymen retained by the author of "Kilmeny." Aboug £50 have been added to the fund within the last eight days. The Duke of Buccleuch has contributed a block of freestone for the colossal figure of the poet, and Mr. Currie, the sculptor, is engaged in the construction of a full size model.

The New Road at Rathgar.—The estimate of the proposed new road to approach the bridge which will span the Dodder near the entrance gate leading to the demesne of Lord Justice Blackburne, is about £11,000, which sum it is proposed to raise by subscription. The grand jury very properly refused to present for a new bridge on the site of Waldron's bridge. We trust that those in authority in the matter will, judging from the extraordinary progress of the locality during the past few years, provide a structure which, in some thirty years hence, it will not be necessary to demolish and replace by one more commodious.

The Commons of Bray.—This tract which it has been proposed to enclose, embraces an area of 57 acres, and is in the parish of Old Connaught, at the County of Dublin side. It is divided into two portions by the turnpike road leading from Dublin, one of which contains about 15 acres. About an acre and a-half was projected for a fair green, eight or ten acres for recreative purposes, and a suitable place for watering cattle. At present it seems to be of little use for any purpose, but if judiciously laid out may considerably enhance the value of property in that very rising locality.

Cholera in Belfast.—We have heard of three cases of cholera, and two of them fatal, in that neglected portion of the borough of Belfast called Ballymacarrett. As the sanitary inspector resides there, we would entreat his attention to it.

The Freemasons' Method of Building.—It has been asserted that they worked more by oral directions than by the aid of plans, and also that they carried on their works without drawings and almost without instructions. So extraordinary and intuitive a knowledge of their craft might well excite a little scepticism amongst the less gifted builders of the present day; for the more closely we examine the various details of their structures (particularly groining, window tracery, and other elaborate works), the more we must be convinced that the greatest forethought and consideration were devoted to every portion of them. This conviction is strengthened by the monument of the two architects of St. Owen Church, Rouen, in the incised slab laid down to their memory, in which they are represented holding a pair of compasses, and what we may naturally infer to be working drawings of some parts of the building.

Railway Valuation.—Mr. Rynd, government arbitrator, visited Sligo lately for the purpose of investigating disputes between the railway and the owners of property touching the value of lands to be taken. Mr. Kirwan, solicitor, with Mr. Vaughan, C.E., and Mr. St. Leger, county surveyor, attended on behalf of the railway. The town and harbour commissioners of Sligo, and Mr. O'Connor, the principal claimants, were represented by Mr. Morris, of the Connaught bar, Mr. Charles Sedley, solicitor, and Mr. Bower, C.E. Mr. Kernaghan, solicitor, appeared for several other claimants. The inquiries were of a private nature, none but the parties connected with the case under consideration and their agents being permitted to be present. When the arbitrator shall have made his draft award it will be lodged in the various public offices for inspection, after which he will attend at a time and place appointed to hear objections; and the parties dissatisfied with his final award may appeal to the jury at the assizes.—*Sligo Chronicle.*

Armagh Catholic Cathedral.—Mr. T. Byrne, builder, of Belfast, has been the successful contractor for the projected works at the Catholic Cathedral, at the sum of £9,866. This only includes the roofing, ceiling, and glazing, together with the finishing of the pinnacles, turrets, &c.; the lower tier of windows, flooring, plastering, and all interior works to be subsequently provided for. We understand he has given the committee the option of completely finishing the entire edifice and handing it over ready for the sum of £15.000.—*Armagh Gazette.*

Road Repairing in Norway.—A feature of Norwegian roads are little wooden posts painted red, and surmounted by a small gable to protect them from the weather. Each peasant in Norway is bound to keep a certain portion of the road in repair; and the inscription on each post records the name of the peasant who is charged with the maintenance of that part of the road, and the number of ells that fall to his share. So that, in point of fact, he who runs may read a record of the name of every farm-house in Norway.—*The Oxonian in Norway.*

Property of the Working Classes in America.—In the savings banks of New York and Brooklyn there are upwards of 30.000,000 dols. deposited, bearing interest at rates varying from four to six per cent., which have been made since the 1st January, 1859. On the 1st of July they paid to sewing girls and working people generally, in dividends, a million and a half of dollars.

Muckross Church, Killarney.—The Earl of Powis has presented the Right Hon. Henry Arthur Herbert with a magnificent baptismal font, to be placed in a pretty little Episcopal Chapel, for some time past in course of erection at Muckross. The font is of Caen stone, beautifully and elaborately hewn. On the bowl and pedestal are numerous devices in leaves and flowers, and on the rim of the former is the presentation inscription in large raised letters. The building is now rapidly approaching to completion, and will be of great importance to the very Protestant neighbourhood in which it stands. The walls are composed of red and white marble indigenous to the soil of Muckross, which being roughly hammered forms a pleasing contrast to the fine limestone dressings with which the structure is ornamented. The windows are all of stained glass; the walls plainly plastered a dark gray, with an open roof stained and varnished. The chancel and aisle are about to be laid with encaustic tiles, and the pewing and other fixtures and fittings for the interior, which are of polished oak and mahogany, are in so forward a state of preparation that it is expected the edifice will be ready for consecration within the ensuing month. It will afford comfortable accommodation to upwards of one hundred and twenty persons; and the works are highly creditable to Mr. Lee, under whose able superintendence they have been executed. It is, however, much to be regretted that the exterior of the building is not in character with the beauty of the interior, nor with the magnificent scenery with which it is surrounded. The walls are too low, and not in proportion to the heavy pitch of the roof. The western gable, which faces the road and is surmounted by a simple belfry about forty feet high, contains only two small lancet windows, thereby exhibiting a large mass of heavy and unsightly mason work. If one handsome ornamental window had been inserted in the gable, it would have given the building a far lighter appearance and rendered it much more attractive than it is at present. But the most unsightly object in the building remains to be noticed, viz.: the chimney shaft between the nave and chancel, which should be forthwith removed. This done, and the ample room for improvement made use of, by the erection of a neat tower and spire at the south-west angle, the Muckross Church would be a pleasing object of attraction in the midst of the gorgeous scenery with which its name is connected. We should have stated that the expense of building and endowing this chapel is defrayed jointly by the Right Hon. Colonel Herbert and his kinsman, Admiral Sir Thomas Herbert, K.C.B.—*Tralee Chronicle.*

Science and Art Department.—The results of the working of the department of Science and Art in all its divisions for the year 1858 show a great increase on the previous year in the attendance of the public on the museums, schools, and lectures. The visitors to the various museums and collections in London, Dublin, and Edinburgh, under the superintendence of the Department, have been 875,898, being an increase of 117,923 on the previous year. The principle of rendering the South Kensington Museum useful as far as practicable to institutions affiliated to it in all parts of the United Kingdom, has continued in action. Numerous objects were lent for exhibition to Aston Hall, Birmingham, and the circulating collection of objects selected from the Art Museum has been exhibited at Aberdeen, Dublin, Limerick, Clonmel, and Waterford, and visited by 58,189 persons, showing an increase of 22,165 on the numbers who visited the collection in six towns in 1857. At Dublin it was the means of stimulating the bringing together of a large number of valuable loans from private sources, and upwards of 1,072*l.* 2s. 3d. was received by voluntary payments on the occasion. The returns from the science institutions and schools (including those of navigation) with the attendance on public scientific lectures, show the number of students to have been 68,212. The returns from all the art schools give a total number of 79,473 persons learning drawing, being an increase of 83 per cent. on those of 1857. The quality of the instruction has never been so high as at present, whilst the average cost of the State assistance for each person taught drawing is being lessened year by year; for in 1858 it had decreased to 10s. 4¼d. each person; in 1857 it was 13s. 1¾d.; while in 1851, before the present system of the department was adopted, it was as high as 3*l.* 2s. 4d. each person. Great numbers continue to attend and prove the accessibility of the Central Museum at South Kensington. They also prove the eagerness of the public to avail themselves of the opportunities which it affords for instruction in its several divisions. The total number who have visited the Museum in the past year has been 456,288, of whom 219,016 persons, chiefly of the operative class, have attended in the evenings, apparently enjoying that privilege very much.—*Report of the Science and Art Department of the Committee of Council on Education*, 1859.

Effect of Moisture in Thickening and Shortening Ropes.—When the obelisk in front of St. Peter's at Rome was being erected under the direction of the architect, Fontana, with complicated machinery constructed with the greatest care, it was found impossible to raise it to its position on account of the ropes being a little too long. Some one in the crowd desired "the ropes to be wetted," and which, when done, the ropes contracted so much that the work was easily accomplished.

Malleable Glass.—A means of rendering glass malleable is said to have been found out in the reign of the Emperor Tiberius, and again in that of Louis XIII. But in both cases, punishment—in the former that of death—was the only recompense bestowed on the discoverers, and their secret, if it ever existed, died along with them. Pieces of glass taken from on old pit twelve feet deep, were indeed found by Colladon to be flexible, and so soft that they might be cut with a knife. But they became hard and brittle on being exposed to the air for a few hours.

So much for River Sewers!—The *Lancet* says that much illness, and indeed death, occurred in the neighbourhood of Westminster and Bermondsey lately owing to the putrid and disgraceful state of the river, aided as it was by the intolerable heat, whilst in the low neighbourhood of Bermondsey, amongst the wharfingers and journeymen tanners, sudden seizure whilst at work is of daily occurrence.

The Monument to Agnes Burns in Dundalk.—The monument to Agnea Burns, eldest sister to Robert Burns, the national bard of Scotland, has been erected in St. Nicholas' churchyard, Dundalk, where the mortal remains of the poet's favourite sister are interred. The monument looks streetward, and has a very chaste and characteristic effect. About £70 were contributed by the inhabitants of Dundalk and its vicinity towards the erection of the monument.

The Electric Telegraph in the 16th Century.—Strada, a writer at this period, describes a correspondence carried on between two friends by means of two magnetized needles. Each made a dial plate with alphabetical letters, and fixed his needle in the centre, turning on a pivot. Irrespective of distance the communication was effected instantaneously by wires and apparatus not dissimilar in principle to that now in use, but of course ruder in construction, each dial indicating the changes of position of the hand at the other.

Sanitary State of New York.—Notwithstanding its admirable position for drainage, and its great Croton Aqueduct, which supplies the city with sixty millions of gallons of water daily,—New York is one of the dirtiest cities in the world. For several years it was generally supposed impossible to sweep its main thoroughfare, Broadway—but an enterprising hatter having demonstrated the practicability of the task, it has since been kept tolerably clean; but the rest of the city seems to be past all hope of broom or shovel. The streets are wide, and are laid out generally at right angles. Its hotels are built on a palatial scale, and there are many other fine buildings; but the irregularity which prevails is a great hindrance to a general architectural effect. The Archbishop of New York, last August, laid the corner stone of a new Cathedral, which promises to be the great architectural feature of the city, and to compare favorably with some of the finest ecclesiastical edifices in Europe.

Bricks that will float used to be made years ago, but the art has been lost until recently. A Monsieur Fabroni has, it is said, discovered their composition, which is said to be five parts of silicious earth, fifteen of magnesia, fourteen of water, twelve of alumini, three of lime, and one of iron. They are infusible, and will float in water though one-twentieth part of common clay be added to them. They resist water, unite perfectly with lime, and are subject to no change from heat or cold. They are nearly as strong as common brick, though about one-sixth as heavy, or considerably lighter than water. They are such poor conductors of heat that one end may be heated red hot while the other is held in the hand.

There is a notice to the public from the carpenters and joiners, thanking their employers for giving them an advance of wages. This stands in pleasing contrast to the existing strike now in progress in London, and reflects credit on all parties concerned.—*Belfast News Letter.*

The premiums for designs for new Foreign and War Offices, and for block plan for the concentration of the principal government offices, amounted to £5,000; the cost of fitting up Westminster Hall for the exhibition of the designs and plans was £302 7s. 3d.; and for the attendance of police during the exhibition of the designs, £41 12s. 8d.; the cost of advertising, printing and copying, £542 9s.; making a total of £5,886 8s. 11d.

NOTICE.

Orders for Subscriptions to, and Advertisements for, The Dublin Builder, *will be received at the Proprietor's Office*, 17, Lower Gardiner-street. *Wholesale Agents*—Messrs. W. H. Smith & Son, *Sackville-street (from whom* "The Dublin Builder" *may be had at every Railway Station), and* George Mason, 24, *D'Olier-street.*

Payments (by Post-office Order or otherwise) for Advertisements in this Journal are to be made to PETER ROE, at the Printing Office, 42, Mabbot-street, Dublin.

Published in London by Atchley & Co., 106, *Great Russell-street, Bedford-square; and to be had in Belfast from* Mr. Henderson, *Castle-place.*

Iron Founders, Plumbers, &c.

BUILDERS' IRONMONGERY, at REDUCED PRICES.
THOMAS HENSHAW AND CO.,
5, CHRIST CHURCH-PLACE,

Beg to call attention to their extensive, varied, and well-selected stock of Ironmongery in all its different branches. It consists of Parlour, Drawingroom, and Bedroom Grates; Kitchen Ranges, Cottage Ranges, Sash Weights; Iron Rim, Mortice, and Stock Locks; Hinges of all descriptions; Wrought and Cut Nails, Eave Gutters, Down Pipes and Fittings, Metal Skylights, Ventilating Bricks; Cast-iron Chimney-pieces, with and without Grates; Rabbit Traps, Fox Traps, Galvanized Wire Netting, Fencing Wire, Sheet and Perforated Zinc, Sink Traps, Furnace Doors and Frames, Hot Air and Plain Stoves. Also on Sale, Saunders' Patent Cooking Range, *the* most economical cooking apparatus of the day.

Manufacturing and General IRONMONGERS and TOOL WAREHOUSE,
81, MIDDLE ABBEY-STREET.
SPADE, SHOVEL, AND TOOL WORKS, CLONSKEAGH.

Agents for Perry's Patent Fire Proof Safes; quality considered, they are *the* cheapest in the market.

BUILDERS are invited to inspect our Stock previous to purchasing.

5, CHRIST CHURCH-PLACE, DUBLIN.

WILLIAM TURNER,
OXMANTOWN FOUNDRY & IRON WORKS,
103, NORTH KING-STREET, DUBLIN.

Cast-Iron GIRDERS, Plain and Ornamental PILLARS, Moulded and Plain GUTTERS. Tank Plates, Gas Retorts and Pipes, Kitchen Range Work, Millwright, Castings, Balconies, Brackets, Staircase Ballusters, etc., supplied. A large variety of Models for the above in stock.

KITCHEN RANGES, Drawingroom Bright Grates, Fenders, Fire Irons, and all kinds of Builders' Ironmongery. MAURICE BROOKS, SACKVILLE-PLACE, Dublin.

HAYWARD, TYLER, and CO, 85, UPPER WHITECROSS-STREET, LONDON, ENGINEERS and BRASSFOUNDERS, manufacturers of high pressure steam-engines, hydraulic presses, soda-water machines, well-engines, and pumps for railways and all other purposes; proving pumps for boilers, iron pipes, &c.; hydraulic machines for proving iron girders, with rams of all sizes, on iron carriage, with gun-metal proving pump, the lever graduated to prove to any required pressure with the greatest accuracy. These machines are used at several of the most eminent Iron Works and Building Establishments in town and country.

HOWARD'S PATENT REGULATOR CLOSET, AND WATER WASTE PREVENTER, manufactured by HAYWARD, TYLER, and CO., 85, UPPER WHITECROSS-STREET, ST. LUKE'S, E.C., has been fixed under the direction of many of the most eminent architects in London and country, and proved to be the most efficient Closet made. It is free from leakage, and delivers only a given quantity of water at each action, into the basin, which can be adjusted when fixed. H. T. and Co. invite attention to these fixed at the Factory; the Court of Inventions, Crystal Palace. Plumbers' Brass-work of every description.

SURVEYING, ENGINEERING, ARCHITECTURE, &c. — PRACTICAL INSTRUCTION is given in SURVEYING, Levelling, Civil Engineering, Architecture Building, Draughting, Mapping, Measuring and Valuing of Land, Timber, Buildings, &c., by Messrs. HYDE, SMITH, and LEWIS, Civil Engineers, Architects, Surveyors, etc., in a short Course of Instruction on moderate terms, including FIELD WORK and the use of the INSTRUMENTS. For Prospectuses, apply at the Offices, 24, Guilford-st, Russell-square.

N.B.—An Architectural, Engineering, and Mechanical Class for Architects, Builders, Engineers' sons, etc., on moderate terms, including instruction in Drawing, Coloring, Taking out Quantities, etc.

Oils, Colours, Glass, &c.

MANNIN'S Wholesale and Retail DRUG, OIL, COLOUR, and GLASS WAREHOUSE,
2, GREAT BRUNSWICK-STREET.
(near D'Olier-street.)

Cattle Medicine of all kinds.

N.B.—Every article is warranted genuine, and at the lowest price.

GEORGE B. STAR, DECORATOR,
HOUSE PAINTER, AND GILDER,
IMPORTER and MANUFACTURER of DECORATIONS, and ORNAMENTAL PAPER HANGINGS,
No. 7, LOWER ORMOND-QUAY,
(within seven doors of Capel-st., Essex-bridge.)

ROOM PAPERS in great variety, 4d. to 40s. per doz.
GILT MOULDINGS do. 1½d. per ft. upwards.
LAMINATED LEAD for Damp Walls, 6d per lb.
PREPARED OIL & GUTTA PERCHA PAPERS, ditto, 1s. 6d. to 3s. per doz.

ESTIMATES for Painting and Decorations supplied free of charge.

NOTE.—The Trade, Builders, and Gentlemen having extensive House Property SUPPLIED at WHOLESALE PRICES.

HIBERNIAN MILLS, KILMAINHAM.

ROOM PAPER.—A splendid assortment of the above, including the newest designs, at moderate prices.

Room Paper, Roman Cement, Portland Cement, Plaster Paris, White Lead, Ground Colours, Patent Driers, Putty, Whitening, John's Cement, Mastic, Coal Dust.

SAMUEL DAVIS, MANUFACTURER,
AND AT
137 & 138, ABBEY-STREET.

Stained Glass,

FLAT LEAD WINDOW, & PATENT
METAL SASH MANUFACTORY,
107 & 108, MIDDLE ABBEY-STREET, DUBLIN.

M. & R. SILLERY beg to inform parties requiring the above that they can supply them at much *Lower prices* than other houses, and respectfully invite an inspection of their patterns

ESTABLISHED UPWARDS OF HALF A CENTURY.

ROOM PAPER, in great variety, at MAURICE BROOKS', SACKVILLE-PLACE, Dublin.

THE Cheapest House in Dublin for Room Papers, Window Glass, and Laminated Lead for Damp Walls, is J. O'LEARY'S, 1, TEMPLE-LANE, DAME-STREET.

PLATE GLASS kept in Stock and supplied immediately, whereby the usual delay in ordering from the Manufactory is avoided.
MAURICE BROOKS, SACKVILLE-PLACE, DUBLIN.

London and Paris Great Exhibitions

Prize Medal Bells.

WILLWAY'S

PATENT ATMOSPHERIC BELL.

By means of this ingenious contrivance, the Wires and Cranks of ordinary Bell-hanging is entirely superseded; is so simple in its construction, that it is almost impossible for it to go astray or get out of repair, and is not more expensive than the present mode of putting up Bells. Sold by

WILLIAM MOONEY, 9, LOWER ORMOND-QUAY.

Auctions, Sales, &c.

AUCTION OF TIMBER, DEALS, ETC.

JOHN MARTIN AND SON will offer by AUCTION, on THURSDAY, the 8th SEPTEMBER, at their Stores, NORTH WALL, their present large Stock of NORTH AMERICAN and BALTIC WOOD of this and last year's import, together with the following Cargoes:—

Pieces.			
24,895 Deals, and 62 Birch	ex *Hibernia*,	from	Saint John's, N.B.
26,470 Deals	.. „ *Mary Carson*	„	St. Andrew's. (*To be sold unreservedly.*)
10,890 Do.	.. „ *British Tar*	„	St. Andrew's.
12,600 Do.	.. „ *Hector*	„	Quebec.
394 Red Pine 109 Hardwoods 10,800 Deals 39,000 Staves	„ *A. Anderson*	„	Quebec.
314 Timber	.. „ *Franziska*	„	Stettin.
10,430 Deals	.. „ *Loretto*	„	Richibucto.

And the following Cargoes, daily expected, if not previously disposed of by Private Sale:—

Pieces.			
741 Timber	.. ex *Fortuna*	„	Memel.
700 Do.	.. „ *Melea*	„	Do.
747 Do.	.. „ *F. Welhelm*	„	Do.
1,482 Do.	.. „ *B. Peiper*	„	Do.
863 Do.	.. „ *Minerva*	„	Sundswall.
11,000 Deals, and 104 Timber	„ *Baltic*	„	Soderham.
14,000 Deals	.. „ *Ask*	„	Pugwash.
Assorted Cargo	.. „ *Columbus*	„	Quebec.
Spruce Deals	.. „ *Arabian*	„	Onanndie.
Pitch Pine	.. „ *Sunderland*	„	Pensacola, U.S.
Timber &c.	.. „ *Rosa*	„	Danzig.
Do.	.. „ *H. Rodbertus*	„	Memel

JAFFRAY BARCROFT, *Broker.*
North Wall, Dublin, 17th Aug., 1859.

AUCTION OF TIMBER AND DEALS.

WILLIAM CARVILL will offer BY AUCTION, on THURSDAY, 1st September, in the CUSTOM HOUSE DOCKS, at One o'clock, The Cargo of St. John's Deals, Plank and Battens, *ex* Palmyra,

Ditto	ditto	ditto	Jane Lovett,
Ditto	ditto	ditto	Eva,
Ditto	ditto	ditto	Harriet Cann.

60 Tons large size Fresh Birch.

The Cargo of 1st and 2nd Quebec Spruce Deal *ex* Caroline A. Simpson.

3 Mills of Pipe Staves.

Also, if arrived, the

Cargo of Crown Memel Timber Deals, Staves, and Lathwood, per Othello, daily expected.

The Cargo, per Victor from Quebec, with Red and Yellow Pine, and Oak, Timber, Deals, Staves, and Lathwood.

JAFFRAY BARCROFT, Broker and Measurer,
Custom House Docks and Rathgar Saw Mills.
Dublin, 22nd August, 1859.

VITRIFIED SEWERAGE PIPES.

ROBERT LOVELY AND SON, the appointed Agents for Dublin to DOULTON, BROTHERS, and COMPANY, having imported a large stock of the above Goods, offer them at a CONSIDERABLE REDUCTION *from former prices.*

OLD-ESTABLISHED SLATE AND TILE STORES,
Nos. 17, 18, & 34, POOLBEG-STREET.

PATENT ASPHALTE ROOFING FELT.

ELLIS AND CO.,
PATENT FELT MANUFACTURERS,
157, Fenchurch-st., London, E.C.;
20, Dutton-st., Liverpool; and
Malone Mills, Belfast.

ASPHALTIC ROOFING FELT, a light, clean, economical, and durable roofing, price 1d. per square foot. Samples and instructions may be had gratis in answer to letters from any part addressed to MAURICE BROOKS, IRONMONGERY, GLASS, & ROOM PAPER WAREHOUSE, SACKVILLE-PLACE.

The Dublin Builder.

Vol. I.—No. 10.

HARMONY IN OUR WORKSHOPS.

PEACE is happily restored between "master and man;" and after the adjustment of temporary differences, they work hand in hand for mutual interests. Our forebodings of a possibly protracted dispute have, to a certain extent, *not* been realized; for the master builders, after a short parley, yielded to the demand for increased wages, though to some of them—who must be thrown out of their calculations considerably—the pecuniary sacrifice will necessarily be important. Every efficient and well-conducted artizan in this city can now *command* constant employment—for the amount of work to be done is still disproportionate to the available hands—and enjoy his THIRTY SHILLINGS PER WEEK; nay more! for "picked men" are at present in receipt of THIRTY-TWO at some establishments. We have already expressed our hearty wish that mechanics in Dublin and Ireland generally should be elevated in the social scale, that an air of comfort greater than at present should prevail in their hearths; and that themselves and families should be afforded rational enjoyment, with a fair share of "the good things of this life," which tend to make existence happy. For the attainment of this end, they are more or less dependent on their employers to remunerate them liberally for their toil; and we trust that the late breach being now built up, it may be cemented over by a permanent compound of good faith and mutual satisfaction. Judging the employers as a body, we believe them to have the interest of the working man at heart; and further, we are convinced that they who insist most strenuously on *fair* prices for their work, keep in view the payment of *fair* wages to their employées. The business of a builder is very much a lottery, which, when drawn for, may turn up either a blank or a prize. The most astute employer cannot guard against erroneous calculations, and one false step may plunge its perpetrator from comparative independence into a ruinous abyss; *vice versa*, a lucky hit may raise a hitherto unknown individual to the rank of a millionaire.

Fluctuation of the markets, sharpness of competition for contracts, with many other occurrences, considerably influence a builder's business, and may prevent his guarding against contingencies infallibly to secure himself. It is, therefore, but just, that, as far as circumstances will permit, he should protect his pocket; and if "the trump" turn up to a few, more frequently than to others, it matters little to the public or to the tradesman as long as masters faithfully keep their engagements. We are led to these remarks by a paragraph in one of the late local manifestos, from which it would be inferred that the builders of Dublin sought but to gratify their personal comforts and luxuries, to the detriment of those who, by the sweat of their brow, filled their coffers. "Win gold and wear it," is a maxim ancient and incontrovertible, which we feel ourselves at liberty to apply in this instance; and as every man has a right to do what he pleases with his own, the taunt falls to the ground, having merged into a personality outside the question at issue. They who undertake on *chance* the responsibility of probable losses in speculative matters, have clearly a just claim to advantage themselves in return when legitimate opportunity offers. We may here mention without irrelevance a circumstance which some years ago occurred in this city, and to the present day will be verified by the chief party interested. A government notice for tenders, issued according to plans, &c.; a detailed schedule of prices to accompany each tender, to be opened when contractor was declared, and attached to the contract. The officials made an erroneous survey, and the building as planned could not be executed on the site available. *One* sharp builder alone discovered this; but finding that deviations from the contract would be paid for by the schedule annexed to the tender, he placed *good* paying prices opposite each item in his schedule, and accompanied his tender therewith, at a lower figure than others relying upon the measurements, could execute it for. The tender was adopted, as also the schedule, and subsequently, on the mistake being made known, the *entire building*, from foundations to roof, was executed at a *good* price, and the contractor reaped a considerable profit therefrom. Suppose a contrary case! Is there any mercy in public establishments (or in some private) for a builder who makes a "*blind*" contract? The pound of flesh is insisted on, the sureties are estreated, and the contract must be fulfilled. Previous errors produce complication between employers and the builders, complication frequently drags in litigation, and litigation ruin to some, or possibly ALL. If, therefore, despite all these difficulties an employer baffles the storm, and by tact and ability steers to a haven of prosperity, is it just that, while honourably defraying his expenses, paying every man his due, his gains should be questioned, or moreover, his mode of applying them?

Of this, however, enough! We live in an age too civilized for master and man not to appreciate their respective positions. Let each scrupulously keep within the prescribed circle, and he best regards his own interests. The most deadly enemies often become the most sincere friends, and we hope that the recent "brush" between master and man may be buried in oblivion, and all go on smoothly in future.

A word to societies! We admire the principle that suggests meetings composed of members of a craft united by the ties of fellowship; but good intentions may often be controverted; a single malcontent may taint—and scatter the seeds of dissension in—a multitude. Let those, therefore, who mean well, beware how peace so happily restored may be broken by the effects of misguided individuals, flushed with victory, again to blow the breath of discord, and to undo the good already secured. The trade societies of Dublin demand much remodelling in their constitution; but to this subject we shall revert hereafter.

AN AMERICAN PYRAMID.—Lieut. Ives, the architect and engineer in charge of the Washington National Monument, has made an official report to the society, in which he says that when raised to the height of 600 feet, the entire weight of the shaft and foundation will be 70,000 tons. The weight of the structure in its present condition is 40,000 tons.

THE PUBLIC BATHS OF LIVEROOL.—In Liverpool, where public baths and washhouses were first established, the taste for bathing seems to spread yearly. During the year ending the 31st of August last the total number of bathers at the St. Paul's, St. George's, and Cornwallis baths were 317,846, being an increase of 15,071 over the previous year. The receipts for 1858–59 were 6.103*l.* 16*s.* 2*d.*, being an increase of 184*l.* 14*s.* 6*d.* over the previous year.

THE ROCK MOUNTAINS OF THE COUNTY DUBLIN.*

In the summer of 1851, I availed myself of some spare time to study the antiquities of the county of Dublin, and among other vestiges of by-gone times, I have examined those extraordinary remains called cromleacs, or druids' altars; I have taken their dimensions, and compass bearing, and made sketches of them. The facts I have collected have led to my concluding, that these monuments are sepulchral, an opinion which is supported by J. J. A. Worsaae, respecting similar remains in Scandinavia. That author's work I had not seen till after my views were formed, a fact which I mention, because to me it seems to be an additional probability that the idea of those monuments being sepulchral is correct.

These remains are known in the county of Dublin, by the name of druids' altars; sometimes, but rarely, by that of cromleac. In examining this or any similar topic, the investigation must be conducted irrespective of any name, which is often but the expression of some olden theory, lost to literature, but preserved orally. Any one who has attended to the way in which the peasantry catch up the stray opinions of learned disquisitionists, will see the truth of this observation, and estimate its value. Literary antiquaries have devoted much time to the question of the purpose for which these gigantic works were raised, and, misled by names, have followed an *ignis fatuus*, with, of course, the usual consequences, being lost in a literary quagmire. How little regard is to be paid to mere names, may be known from the fact that, besides the two very opposite ones of cromleacs and druids' altars, by which they are known in the county of Dublin, similar monuments have various other names in other localities—for instances, in the county of Kilkenny, one is called the stone of the champion, another the goat's stone, another the ass's manger, another the grey stone; names purely local and so far differing from those used for such monuments in the county of Dublin, that they indicate no opinion as to any common object which their founders may have had in erecting them. We must therefore look beyond mere names, and, by a careful examination of the remains themselves, endeavour to ascertain the purpose for which they were constructed.

Howth.—On Howth hill, about 1 mile from the sea shore, is a rock monument; it is on the side of a steep hill, under a high cliff of quartz. The roof rock measures 17 feet in its greatest length, 12 in its least, its average measure being 14 feet; at its thickest part it exceeds 6 feet in depth, and its weight I calculate at about 90 tons. An attentive examination of this monument has convinced me, that this enormous mass constituted the roof of a chamber lying E. by N.; the chamber being about 12 feet long, by 4 feet wide, the floor of clay, the walls of other great stones, 3 to each side, and one at each end, 8 in all. The roof rock, though very irregular at its upper surface, is tolerably level beneath, and was so situated as to have it horizontal, or nearly so, thus constituting a level ceiling to the chamber; but, owing to the great thickness and consequent weight at one end, the supporting stones have given way, and, in slipping, the roof rock has been caught by a part of the stone on which its present higher portion rests. The supporting stones from which it has slipped are still standing undisturbed. These are about 7 feet high, so that the original height of this monument must have been 12 or 13 feet. The longer direction of the chamber is E. by N., its floor is a little below the natural level of the soil. There are several rocky fragments lying around, which in one part form a sort of rude intrenchment to the monument, but whether artificial, or the result of accident, I could not decide. This monument is of quartz rock.

Shanganagh.—This rock monument is about 7 miles south of Dublin, within ½ a mile of the sea shore. The field in which it lies is almost level, there is no trench or other artificial arrangement in connexion with it. There are only four supporting stones, two on each side, one of these has been broken in the middle, and the opposite one fallen in; but the roof rock rests on the side of the fallen one and the top of the fragment on the opposite side, so as to be retained in its present inclined position. The roof rock is nearly 7 feet 6 inches square, by about 3 feet thick; the under side is, as usual, nearly flat. The weight is probably 12 tons. The chamber lies E. and W., is 6 or 7 feet long, by 2 feet 6 inches wide, and was probably 5 feet high. The floor is of clay, and at the level of the surrounding surface. This monument is of granite.

Brennanstown.—The two monuments I have described, have their roof rocks disturbed from their original situations: the present one has suffered no such derangement. It is situated in a small and deep grassy valley, close by a small hill stream, and about 1 mile inland. The valley is modernly called Glen-druid. The roof rock is 15 feet broad and across, it is 5 feet thick at its utmost measure; the average thickness being about 3 feet. Weight, 60 tons. These are, of course only the proximate quantities. The chamber is about 12 feet long, by 6 wide, and the same high. The direction is E. and W., the floor clay, and considerably lower than the surface of the field. There are several large stones lying about, and tolerably decided indications of some of them having been arranged to form two parallel lines of approach to the lower end of the monument. It is of granite.

Kilternan.—This is a still more gigantic monument than the one immediately preceding. It is situated on the slope of a coarse, rocky, and furzy hill, about 8 miles south of Dublin, and about 3 miles inland. The roof rock, in its extreme, measures 22 feet long, 12½ feet wide, and nearly 6 feet thick; probable weight, 80 tons; the greatest length lies E. and W. The supporting stones have given way on the south side, so that the roof rock leans in that direction. At the north side the chamber is 5 feet high; it is about 18 or 20 feet long, by ½ that in width. The supporting stones are a good deal disarranged, which renders it difficult to decide these points with certainty. The direction of the chamber appears to be E. and W. The floor of the chamber is of clay, and below the surrounding surface. At one side of this rock monument, the hill seems to have been cut away, and roughly faced with stones, so as to keep it clear of the monument, which is of granite.

Mount Venus.—On the side of the counties of Dublin and Wicklow range of mountains, and about seven miles inland, in a very sheltered situation on Mount Venus, is a very remarkable rock monument. The extreme measures of the roof rock are 20 feet long, 10 feet 8 inches wide, and 4 feet 5 inches thick. The average thickness is 4 feet. The chamber lies N.W., it is rectangular, and about 18 feet long, by 6 feet wide, and 4 feet 5 inches thick; the floor is of clay, and a foot below the surface level, to which height its sides are faced with small stones without mortar. The roof rock rests at an angle of 45 degrees *against* the upright one. This supporting rock is 8 feet high from the surface to its apex, and must have been higher, as it is evidently broken at the top. Measured at the surface level, this rock is 5 feet 6 inches wide on its inside face, its thickness is 3 feet 8 inches. As all the pressure of the roof rock comes against this, the only supporting stone, it must be firmly embedded in the ground to resist the immense weight lying against it. The roof rock probably weighs above 70 tons. There are the stumps and fragments of other large masses of rock lying about the chamber; one great mass, which was probably a supporting rock, is lying on the ground; its measures are—length, 14 feet; average breadth, 4 feet; average thickness 2 feet. If we suppose this to have been set upright, and sunk in the ground 4 feet, it would be still 10 feet above the ground. Add to this the thickness of the roof rock, and the result is that this monument had probably a height exceeding 14 feet. This monument, besides its gigantic proportions, is remarkable for the sharpness of the angles of every part of it. There is no appearance of weathering. In other similar remains the angles are rounded as if they had been exposed for ages to the influence of the elements; here on the contrary, the stone is as sharp as if but recently quarried; there are, nevertheless, no marks of the hammer, chisel, wedge, or jumper. The sharpness of the angles may be partly owing to the monument being in a very sheltered situation, possibly to the stone being of a very good quality, and also, that, till a comparatively recent period, the monument may have been covered up under a mound or barrow, a suggestion which the monument on Knockmary will elucidate. This monument is of granite.

Glencullen.—On the hill at the Dublin side of Glencullen I discovered a rock monument. The roof rock is 10 feet long, 8 feet broad, and 4 feet thick, extreme measures; the longest direction of the roof rock is W.S.W., or nearly E. and W. The chamber is greatly disarranged.

Knockmary.—The monuments heretofore described have been possibly for ages lying exposed, and subject to casualties and violence. In describing them I have ventured to offer conjectures as to what they may have been when in their pristine state. However plausible these conjectures may appear, they want that convincing force which the examination of a rock chamber, to all appearance undisturbed, will have. Fortunately, such an examination has taken place lately, and the evidence it has afforded I now furnish. The Phœnix Park, Dublin, consists of a gently-sloping plain, which, on the south side, dips rather suddenly towards the river Liffey. In the course of some improvements which were making in this park, the workmen were removing a mound on the brow of the slope; about 15 feet high, and 120 feet in diameter: 4 small urns of burnt clay were found; they contained ashes and fragments of burnt bones; one of them has been preserved, and is now in the Museum of the Royal Irish Academy; they were enclosed in small stone chambers or cists. In the centre of the mound was a rock chamber; the top rock, 6 feet 6 inches long, 3 feet 3 inches wide, and 1 foot thick. The longest direction was N.N.E., or nearly N. and S. It was supported on several stones, enclosing a chamber of an irregularly oval shape, and about 4 feet long, by scarcely 2 feet deep, the floor of clay, and below the surface level. In this chamber were found two perfect male skeletons, and a human thigh bone; the individuals, of whom the remains were here discovered, had passed the meridian of life. The skeletons were doubled up, and lay with their heads towards the north; there were also found a bone, supposed to be of a dog, a quantity of small sea shells, the *Nerita littoralis*, prepared so that they might be strung, and some of which had a string of sea-weed passed through them; a small bone fibula, and a flint knife or arrow head. The roof rock is of calp, and looks water-worn, as if it had been taken from the bed of the adjacent river. Here, then, is a rock chamber to all appearance undisturbed, and it furnishes clear proof that the purpose of its erection was sepulchral.

---

* Read by Mr. Henry O'Neill, before Kilkenny Archæological Society, and published in their Transactions.

On looking at the Knockmary chamber as it now stands, denuded of its enclosing barrow, it will be seen how much its general features resemble those of the other rock monuments I have described. The probability appears to be, that all these rock chambers were sepulchral, the larger ones being intended to hold several bodies, as, the various members of a distinguished family, or several chiefs who may have fallen in conflict; that originally these chambers were covered over with a quantity of earth, or whatever other suitable material was at hand; that these barrows have, as in the case of the Knockmary and Dungannon rock chambers, been removed, leaving the monuments exposed, and that the roof rock originally had its under surface horizontal, though now in most cases these rocks lie off a part of their supporters, and inclined to the horizon. It is unnecessary for me to add that the facts I have indicated are at variance with the supposition of these rock chambers having been druids' altars, a notion which their great height and magnitude seem sufficient to negative, and their having been concealed in enclosing barrows completely destroys.

Rock chambers are very extensively distributed over Europe and Asia; they abound particularly in the north of these regions, but they have been found as far south as Bombay; in no case is it known by what people they have been raised—they belong to an age antecedent to all history. Some antiquaries divide them into three classes, distinguished by the remains found in them into the stone, the bronze, and the iron: from the flint arrow head found in the Knockmary barrow, it would doubtless be classed as of the age of stone, the most ancient of these monuments. The Dungannon rock chamber is described as being near the summit of the barrow. All those I have seen, are on what seemed to be the natural level of the soil, and the floors of the chambers, with one exception, below that level—in the Brennanstown one, perhaps three feet.

The remote time at which these monuments are supposed to have been erected, the very inadequate means which their founders are thought to have possessed for the execution of such gigantic undertakings, added to the deep veil of mystery which hangs over the race or races by whom they were constructed, are circumstances which must render rock chambers deeply interesting to the antiquary, the philosopher, and all who study the history of our species. One fact is clear, that they were not erected by the giants of old. The remains found in even the most ancient of them are of beings not above the average standard height of the present day.

Those who have read the accounts of similar monuments situated in other parts of this island, cannot have failed to observe how often it is mentioned that there is a tradition of human bones having been found under them—a circumstance which further corroborates the conclusion I have deduced from the rock chambers of the county of Dublin.

From the preceding accounts the following general characteristics are deducible:—That the county of Dublin rock chambers are formed of upright masses of stone, covered over with a single rock, having had its under side horizontal and level, or nearly so; that the inner surfaces of the supporting stones were also level and placed in line with the sides of the chamber; that the rocks, more particularly the roof rocks, are rough and massive, constituting a monument, generally speaking, of gigantic dimensions, that the chambers are of a corresponding size, have plain clay floors, sunk below the ordinary level of the surrounding soil. The longer direction of the chambers is, in most cases, E. and W., or nearly so. That these remains are found singly, without any apparent connexion, as regards each other, or any religious or other monument of ancient times; and that each rock monument is constructed of the kind of stones found in the locality.

I have read accounts of similar monuments situated in other counties, but do not recollect any one of them equalling in magnitude the largest rock chamber in the county of Dublin.

I have described every rock monument I know of in the county of Dublin. There may be more—but I have taken the best means in my power to ascertain their existence. The best way I know of is an examination of the Ordnance Survey map, and marking on an index pocket map, with vermilion, the locality of each monument. My reason for limiting this essay to the county of Dublin is, that it is better to complete one county than give even more examples without having the collective character which is attained by limiting the locality.

To our antiquarian societies I would respectfully suggest, that the study of our antiquities would be greatly accelerated if the principle of the division of labour were made use of—if one member were especially appointed, and devoted himself to the subject of raths, another to rock monuments, a third to ancient crosses, a fourth to pillar towers, a fifth, or perhaps several, to old castles, others to ecclesiastical buildings; again, each labourer might take a limited district, a county where specimens of the class of antiquities allotted to the individual were rare, a barony or other division, when more numerous. Again, in the examination of monuments, *method* should be carefully observed—the general nature of the locality, the peculiar local position, compass bearing, measurements, general appearances, details of interests, presumed changes from its original condition, careful drawings—all these are necessary in order to convey a correct idea of an ancient monument.

In this paper but a very small part of Ireland—old Ireland—as these rock monuments clearly show, is embraced. I hope other investigators will come forward, and that ere long, the remaining counties will be examined and detailed.

COUNTY SURVEYORS OF IRELAND.

THE annual meeting of this body was held on the 7th ult., at the rooms of the Institution of Civil Engineers, 41, Upper Sackville-street. Mr. Williamson, Tyrone, in the chair. The report of the proceedings of the committee during the previous year was read and adopted. Among other matters it stated that on the preceding day a deputation had waited on the Chief Secretary, Mr. Cardwell, the Attorney and Solicitor-General being present—when Mr. Stokes, Kerry, briefly put forward the case of the county surveyors, referred to the favourable report of the select committee of the House of Commons, 1857; the introduction in the succeeding session of a remedial measure by the Chief Secretary, Mr. Herbert; the intended legislation by his successor, Lord Naas; and the disappointments occasioned by the recent repeated changes of ministry. Mr. Cardwell undertook to examine the several documents and statistical tables furnished to him, and to give the subject his attentive consideration. Among these documents was the following general statement:—

"The office of County Survey was instituted in the year 1834, by the Grand Jury Act, 3 and 4 Wm. IV., chap. 78, which was amended in 1836 by the Act now in force, 6 and 7 Wm. IV., chap. 116. It was the first public office for which a competitive examination was required. The maximum salary was fixed by the Act of 1834 at £300 per annum, 'inclusive of all charges and expenses, except £50 yearly for an office and clerk, and at that period the cost of living was considerably less than at present. The duties of the office comprised the designing and superintendence of the construction of all 'county' roads, bridges, and buildings, the management and supervision of their maintenance, and the guardianship of the public interests in matters connected therewith. By the Act of 1836, the amount of duty was increased, the salary remained as before, and power was given to appoint assistant surveyors, at salaries not exceeding £50 per annum. Subsequently the following acts were passed, each of which added to the duties of the office, without providing any increase of salary, or allowance for the expenses attendant on the additional duties imposed:—1st Vic., c. 1; 9th Vic., c. 1; 9th Vic., c. 2; 9th Vic., c. 3; 9th Vic., c. 4; 9th and 10th Vic., c. 107; 11th Vic., c. 1; 14th and 15th Vic., c. 21; 16th and 17th Vic., c. 136; 19th and 20th Vic., c. 37; 19th and 20th Vic., c. 63; 20th and 21st Vic., c. 15; 20th and 21st Vic., c. 16. The tendency of all proposed legislation affecting the office, has been to impose new duties without providing any remuneration. The new roads and bridges made during a quarter of a century under the grand jury acts—the new roads and bridges made under the various grants and relief acts—the roads, piers, and harbours previously maintained by the Commissioners of Public Works, and the construction of the bridges required by the drainage acts—have been, from time to time, placed under the superintendence of the county surveyors, and have enormously augmented the original duties of the office; in the item of road maintenance alone the increase from 1834 to 1854 has been from 13,191 miles to 36,703, and to this mileage have been since added all the turnpike roads of the kingdom. The annual expenditure now under their control amounts to nearly half a million sterling. The extent of roads under each surveyor's superintendence in 1854 varied from 400 to 1,900 miles, and the expenditure from £4,000 to £31,000 annually. As all are paid equal salaries, the remuneration is clearly disproportioned to their services and expenses; and as all receive the maximum, it is evident that the grand juries do not consider the salary too high, even in the smallest counties. From the peculiar nature of the works, spread as they are over such large areas (in some counties more than a million acres) their superintendence is particularly laborious and expensive, and would be but reasonably compensated at seven or even eight per cent. on the expenditure; but, from the low salaries given, without any allowance for travelling, the whole cost is but 4.2 per cent. In effect the remuneration in no case exceeds £200 per annum; and in the larger counties, from the increased outlay for expenses, it is considerably less. While a retiring allowance is provided for nearly all public officers, there is no provision by which county surveyors can be superannuated under any circumstances. The claims of the county surveyors for the improvement of their office having been repeatedly brought under the consideration of the executive and made the grounds of a petition to parliament, a select committee of the House of Commons, in 1857, recommended—increased remuneration—a classification of counties with salaries adequate to the extent of the duties—a superannuation allowance—and an increase of the salaries of assistant surveyors. If these recommendations were enacted in the manner proposed in the grand jury bill introduced by the Chief Secretary for Ireland in 1858, and were carried out to their fullest extent by the respective grand juries, the increase in the taxation would barely amount to one farthing in the pound on the valuation of Ireland; and with reference to such an increase, the select committee further state:—'Your committee are strongly of opinion that the cost of providing a really efficient supervision of county works, so far from entailing any additional charges upon counties, would be productive of increased economy as regards the application of the county funds.'"

VICTORIA BRIDGE—MONTREAL.

One of the greatest works of engineering science—the Victoria (St. Lawrence) Bridge, at Montreal, is now within a very short stage of completion. The Grand Trunk Railway, which traverses 1,200 miles of the richest parts of Upper and Lower Canada, is, indeed, a great boon to that country, yet, without the connecting link between the north and south shores of the St. Lawrence, this railway is very imperfect. The St. Lawrence is for five months out of the year frozen up, and all communication with Canada by ships or steamboats is entirely suspended during that period. For a long time the difficulties of bridging the St. Lawrence were deemed all but insurmountable, the width between its shores, even at the narrowest crossing, being very considerable, the velocity of the current very great, and the headway and waterway required for the navigation of steam vessels and huge rafts of timber were also extensive; but far more formidable than all these was the effect of the "breaking up of the ice." The whole field of ice, extending nine miles in length, and of the entire breadth of the river, to a depth of from three to five feet, becomes one floating mass. Its velocity, though slow at first, increases to a frightful extent through the influence of the melting snow, until it breaks up, when the detached masses are driven with fearful violence against any impediment, and, when effectually obstructed, it "packs," layer upon layer, to the height of fifty to sixty feet. Buildings are prostrated by the "shoves," and disasters of a most alarming nature frequently occur; indeed, so rapidly does the packing take place that vessels near the shore have been frequently buried and crushed. This, then, was the force that the piers of the bridge would have to withstand. Yet, in spite even of this difficulty, a bridge has been devised, and is now just about to be completed, with perfect success too; and in two or three months from the present time a ceremony will probably take place at Montreal that ever will be remembered. To Mr. Robert Stephenson is due the honour not only of designing the Victoria bridge, but of determining the possibility and applicability of a bridge at all across the St. Lawrence. He visited Canada in 1853, and decided that a bridge was practicable, and did not flinch from the task of contending with the ice. He well considered the different schemes proposed by various parties to resist this moving mass, most of which were similar to those adopted in Norway, the structures being composed of framed timber; but Mr. Stephenson rejected them, on account of the perishable nature of the material. His views have been carried out to a verity, for to the timber temporary breakwaters and cofferdams used by the contractor during the construction of the bridge, the effect of the ice has been singularly destructive. Whole balks have been disintegrated into mere fibres, and the pores of the timber have been frozen through and impregnated with ice. Mr. Stephenson determined upon the adoption of stone for the piers and icebreakers, the latter forming a part of the former, and being in the form of sloping cutwaters on the up-stream side, their fronts presenting an angular face to the ice. The object of the arrangement was not to stop or defy the ice, but to coax it as it were, to climb to the top, when the overbearing sides of its mass would gravitate, parting it in the middle, and the two halves would pass harmless away through the openings. This very effect has already taken place, and during the four years the bridge has been in course of construction the stone icebreakers have stood the severest test of the "breaking-up" without injury. The superstructure is similar in construction in almost every respect to the Britannia-bridge, the difference being that while the centre Britannia tube is 460 feet span, the central span of the Victoria bridge is 330 feet, all the others being 242 feet. The Victoria tubes also differ from the Britannia in not being constructed on the cellular principle; indeed they are the largest tubular beams ever constructed without cells. But the great total length of the Victoria bridge is its striking peculiarity. There will be a line of iron tubing a mile and a quarter in length, stretching from shore to shore. This immense iron viaduct, even in its present incomplete state, viewed from either side, or better still from the river, is truly magnificent. All the details were arranged here, the designs being made under Mr. Robert Stephenson's own eye, and the whole being carried out under the supervision of his relative, Mr. George Robert Stephenson, who attended not only to the designs and construction of the tubes, but even to the manufacture of the iron at the various iron works. Elaborate drawings were made by that gentleman, and the dimensions and strains for every plate and piece of iron were calculated and given by him. The tubes were made at Birkenhead, every plate being punched in readiness; in fact, all being done in this country except the permanent riveting, so that nothing but skilled labour was required in Canada to sort out the parts already marked, and permanently rivet them together. So determined was Mr. Stephenson to carry out this work successfully that he undertook the management of it in all its details in this country. Regarding the proportions of the bridge thus described, perhaps a few figures may be interesting, and your readers will probably be startled at the vastness of the following quantities in the structure. The masonry in the piers, icebreakers and abutments amounts to nearly 3,000,000 cubic feet, a quantity which would cover one acre piled solidly to a height of about 64 feet, and its weight 220,000 tons. The iron in the tubes, weighing about 9,000 tons, is held together by upwards of a million and a half of rivets. To Mr. Alexander M. Ross, resident engineer, great credit is due, he having specially devoted himself to the masonry. Mr. Hodges represents the contractors, Messrs. Peto, Brassey, and Betts, and on him has devolved the principal responsibility of the work; likewise Mr. Stockman, who in the early part of the present year went to Canada, accompanied by Mr. S. P. Bidder, to make a full inspection and report upon the work.

ART UNION OF IRELAND.

We with pleasure learn that the Subscription Lists of this Association are filling rapidly; and we think that the Exhibition of the Works of Art which have been selected by the fortunate prizeholders of the past year, and which is now open to subscribers and their friends, at the new rooms of the Society, in Grafton-street, ought to secure a large accession of subscribers for the present year.

We have been requested to mention that eighteen American subscribers' names have been forwarded by the New York Honorary Secretary, Mr. Watson, who is at present in Dublin.

"FALLING MOULDS."

[Apropos to the Biographical Notices in recent numbers of the "Dublin Builder," of the late William Vitruvius Morrison and James Gandon, architects, the following, from an unknown correspondent, has been submitted for publication. We accede, though, perhaps, appreciating more the animus of the author, which seems to be rightly directed, than the poetical merits of the composition.—Ed.]

The prophet dies! yet still his words outlast, like fires immortal,
So Gandon's genius shines to-day from portico and portal;
But Gandon 's dead, and buried long where soft suburban moisture
Has melted down to mould that heart which hated Art imposture;
And though his works and genius are with Irish pride regarded,
Still no humble cenotaph his memory is awarded.
The cold neglect of him to-day is not a kind reflecture
From that old City once he crowned a Queen of Architecture.

The "monster" system grows apace, unwieldy in dimensions,
And Progress runs a lightning race of patents and inventions;
The Machine *versus* Man contend, and clash in dread collision—
Man's handiwork laughs back on Man, its maker, in derision;
Temples rise, and townships grow, and population faster,
Run out like mad to clutch at homes of paper, lath, and plaster.
The monkey styles are much the same in mansion or prefecture—
From head to foot our streets are vamped in *fungi* architecture!

An Order's wanted, and we get Utopian for Ionic;
"'Tis new, at least," the public owns, in language quite laconic;
What boots it that the Parthenon or ruined Colliseum
Lift up their crests to heaven still—a hero's mausoleum?
The Seven Lamps have given their light, and Etna or Vesuvius
Is not more lasting than the leaves of ancients like Vitruvius.
Dear master minds of Greece or Rome, time can ne'er affect your
Grand foundations, as it does our *fungi* Architecture!

Mum's the word in every mouth; some legislative Solon
Advances from the comma state to state of semicolon,
And, pigmy like, he grasps the scroll that Titan's can abandon,
As only fit for master hands like Morrison or Gandon.
Rebecca rules our public boards, and Patrick bows to David,
The Cymri piles our town with stones, and helps the Gael to pave it;
Raphael guides the pencil still, and Ruskin lives to lecture,
The glorious dawn of Christendom's enfranchised Architecture.

C. C. H——Y.

Amalgamated Society of Engineers and Millwrights.—On the 26th ult the Dublin Branch of this society assembled to present their late secretary, Mr. George Hodges, of Irishtown, with a valuable gold watch and chain, manufactured by Mr. Donegan; also an address, in recognition of his valuable official services

THE WATER SUPPLY OF DUBLIN.[*]

IT gives us much pleasure to see that this question attracts the attention it deserves. It is a happy thing that the community of Dublin seem to be awaking to the due consideration of what so deeply affects them.

We have already published a letter from Mr. Martin, T.C., on that subject and the sewerage, and since our last article a very clever paper has appeared in the *Evening Mail*, recommending that the supply be taken from the Liffey, at Kippure—a source, in fact, of almost perfect purity. But is it like the other pure objects which through life we seek and hope for, but cannot reach? We fear it is. However, it will be our duty to investigate this in due course with the other propositions under consideration; now we have to deal with the nature of the supply from the Dodder and the proposed catchments, and that to be had from the canals; and, perhaps, we can scarcely do better than give the following extract from the paper we have alluded to, as to that from the Dodder, which we have already, in our former number, shown to be highly objectionable:—

> "The Corporation of the City of Dublin had been for many centuries guardians or owners of the watercourse from Templeogue; but as they were not owners of any of the lands through which it ran, they could not effectually prevent the occupation of its banks by mills and factories. That such occupation had commenced and produced inconvenience to the public and impurity to the water is manifest from the language of an Irish statute, 5th George I., cap. 16 (A.D. 1719), still in force, which recites that the corporation 'had for many ages past been seized and possessed of' that watercourse, and enacts severe penalties against persons ponding up the water, and against its contamination by the tuck-mills or nuisances on its banks. Notwithstanding that precautionary legislation, we find that there are now three paper-mills, one woollen factory, one tuck-mill, one iron-mill, and six flour-mills, using the Dodder water, above the Tongue at Kimmage, and one iron-mill, one flour-mill, and some small tenements and tan-yards in Dolphin's Barn-lane, using the city watercourse between the Tongue and James's-street basin. The paper-millers have always made paper from old rags, steeped, boiled, and washed with the Dodder water, letting the refuse liquid run into the tailrace. They have of late years used straw saturated with powerful acids, boiled into pulp, and discharged the refuse liquid, or "straw soup," into the stream, which was proved, on a prosecution instituted by the corporation in 1854, to have killed the fish, and produced sickness to persons and cattle that drank of the water more than a mile lower down the stream. Woollen and tuck millers are known to use the most disgusting materials in scouring their fabrics, and the rinsings from those on the Dodder above the city weir must, from their position, drain into the river and largely defile the watercourse."

It must be needless to go farther to prove the unfitness of the Dodder and catchment waters; but we have an enquiry to make, which should not be passed by. It is averred by the supporters of that scheme that Dr. Apjohn's analysis of the Dodder water shows it to be purer and better than that from either of the canals. We would ask those who obtained that water for test—*At what time of the year was it taken from the Dodder?* It has been stated on good authority that the water from which the analysis was made "*was procured after a drought of several months*," and that samples taken a few days subsequently at old Bawnbridge, after *a fall of rain*, "exhibited all the usual appearances of bog-water," whilst, of course, that taken after a long drought was entirely from springs, and free from any bog taint. That the water taken up at the old Bawn-bridge was as described we have the best reasons for believing, and that water coming from that source must be "tainted with peat" is acknowledged by Mr. Hawksley's report. But, perhaps, inasmuch as that the Rivington water is almost equally "tainted," it is presumed we are to be satisfied, and although it has been shown, in addition, that the catchment area, beyond that presenting peat-bog, contains "*graveyards, villages, residences in vast number, and all the land manured with soil taken from the city.*"

Before, in a future number, we go into particulars of the difficulties which present themselves, respecting the supply from Kippure, we feel it right now to guard the public against misconception on several points which appear in the publications we allude to; because although no one who understands the subject could for a moment deny that the supply from Kippure would be more to be desired than from any other source within reach of Dublin, as regards original quality of water and unsullied purity, yet there must be such grave doubts as to the possibility of obtaining it, except at a cost and risk in litigation, perhaps not to be compensated for by any advantages, that we dread being led into the temptation, under the idea that other water is not to be had fit for use, and at a cost within the means of the citizens.

We have great fears of a second edition of the Liverpool *modus operandi.* If the first step be taken in either the Dodder supply or that from Kippure, it necessitates the last, whatever that last one might cost; and our belief is, that no human foresight could predict what it might be. The question, we think, now lies between the supply from Kippure and that from the canals. The evidence extant as to the impurity and positive unwholesomeness of the catchment and Dodder supply will, we can scarcely doubt, overset the views of those who at present advocate it; and, in fact, the reports of the engineers employed by the Corporation are conclusively in favour of the supply being taken from the canals, and plainly show that the present proposition was adopted only as a *dernier resort,* because the canal companies hesitated to bind themselves to the maximum supply demanded. These facts we shall show, in a future paper, from the reports themselves, which exhibit, by the way, an extent of plagiarism, we might, perhaps, say, exceeding anything we have ever before discovered, even in those days of "professional robbery," and which, for the sake of our profession, we cannot but deplore. Formerly it used to be that the ideas of the dead only were stolen by the living, on the ground, no doubt, that "dead men tell no tales;" now the living steal from the living, "and blush not at the theft."

But to our subject.

The paper in the *Evening Mail* is not content with introducing to the notice of the citizens the purest and best water that can be had, but, like some of our fair ones, who, being favoured by charms irresistible, will not allow that others have any—it slanders the canals most unmercifully, and, like most slanders, having very little, if any, foundation.

It tells us that—

> "The Grand Canal cut through such varieties of strata in its lengths of over 90 miles, receiving the drainage of small streams, bogs, and natural springs, its waters must necessarily be heterogeneous, and it has been ascertained by repeated analysis of our best chemists to be inferior in purity, colour, and softness to the unmixed waters of the Liffey or Dodder taken at their source. It has of late years become notorious that the great diminution of the boat traffic on that canal within 15 miles of Dublin has almost changed its character to that of a stagnant ditch, rankling with noisome weeds, which become detached by the occasional passage of boats and opening of the lock gates. . . . . . The Royal Canal being chiefly supplied from Lough Owel, near Mullingar, and other limestone springs, its water is ascertained to be of better taste and

---

[*] See page 110 *ante*, and previous numbers.

brighter colour, but of greater hardness than that of the Grand Canal. It has also become nearly stagnant and undergrown with weeds from want of constant traffic. The Midland Railway Factory and an extensive bone factory largely consuming deleterious acids, have been lately established on its bank, within two miles of Blessington-street basin."

Now, in place of the water of the Grand Canal reaching Dublin affected by *ninety miles of drainage of small streams, bogs,"* &c., the fact is, that the centre of the summit level, Robertstown, is only *twenty miles* from Dublin. From thence the Canal falls, not towards Dublin, but *towards the Shannon*, nearly 70 miles, and unless the "streams from the bogs" run up to Dublin, they cannot reach it any other way. The level also of the Bog of Allen is considerably lower than the summit level of the canal; it is, therefore, impossible that bog-water can reach the canal under any circumstance. The drainage from that bog, in fact, passes away by culverts under the canal.

The main supply of the summit level is from pure springs; one of the most remarkable being St. James's Well, at the termination of a branch of the canal beyond Robertstown—a source which, if developed as it might be at a moderate expense, would, perhaps, in itself alone give an ample quantum for all purposes. The other principal supply between that and Dublin is the River Morrel, an abundant and pure stream. To speak, therefore, of 90 *miles fall of water* towards Dublin, is to exhibit a thorough want of knowledge of the subject.

Again—This paper asserts the diminution of the traffic of the canal has been so much during the last few years, that within 15 miles of Dublin has become "*a stagnant ditch*."

This is conclusive as to the writer's ignorance of facts, as may be seen from the following, taken from the official returns for 1850 to 1858:—

			Tons.	Cwts.
No. of Tons carried on the Grand Canal to and from Dublin,		1850	226,633	15
Ditto,	ditto,	1858	236,622	5

In place, therefore, of diminishing, the traffic has increased; and, according to that tonnage, the number of boats that pass any given point within 15 miles of Dublin, may be taken as from 15 to 20 daily. How the canal could become "a stagnant ditch" under such circumstances, cannot be easily conceived.

Now, as regards the water of this "stagnant ditch," what does Dr. Apjohn say in his report to the directors on the subject?

> "As respects the canal water, I have no hesitation in saying, that the specimen of it which I have examined is *soft, sweet, and wholesome, and well adapted for domestic uses of every description.*
>
> "Before concluding this brief report, it may not be out of place to add, that the exact determination of the amount of organic matter in water is a thing of very difficult accomplishment, and that, from the manner in which it is usually attempted, the relative proportion of the organic to the saline ingredients is sure to be exaggerated. I have paid much attention to this point in the course of the inquiry just concluded, and I am quite certain that the quantity of vegetable and animal impurities in the canal water—impurities of which no natural water is ever destitute—does not exceed that indicated by the analysis. I may add, that their relative proportion is much too small to leave any room for apprehending that their presence can confer upon the water properties which would render it either disagreeable to the taste or injurious to the health."

But he says a great deal more; for if his very elaborate figures be analyzed, it will be seen that the mean amount of "organic matter" *in one gallon of Grand Canal water* is only 2·798 grains!—that is, merely *two grains and the eight-tenths of a grain, fractionally, in every seventy thousand grains*, that being the weight of *a gallon of water!*

The wondrous talk, therefore, about the *excess* of organic matter in the canal water, is merely talk; and in the face of these facts, we can scarcely suppose that the *natural* purity of the Granal Canal water will be again questioned. As regards Mr. Martin's *supposition* respecting the *practices* of "the 2,000 boatmen," in defiling the canal water, he may feel assured there never was anything more erroneous. A little thought will tell him it could not be as he says. There are no means in, or attaching to, a canal boat which would permit of *the water* being made the receptacle of their filth; and we can vouch, from our own experience, that such is not the case. We admit his fact as to bilge-water being pumped into the canal; but we hope to show, before we conclude this subject finally, that there is no difficulty in perfectly filtering the water for the city supply, even within the extent of its present basins.

With respect to the water of the Royal Canal, the paper in the *Evening Mail*, is also in error. It states "*it is of better taste and brighter colour*" than that of the Grand Canal, but that the Royal Canal also has become "stagnant."

Dr. Apjohn's analysis tells a different story. It says—

> "The water as it reached me, though quite clear, had, when compared with the pipe-water of my laboratory (in Baggot-street, taken from the Grand Canal), *a yellow tinge, and its taste was less agreeable*," &c. . . . . "As respects the amount of mineral matter held by it in solution, *this water must be considered to be a pure one*, and the same might be said of its organic matter, which, notwithstanding the *colour and taste* of the water already adverted to, are certainly not present in inordinate quantity."

That the water is really good and desirable, there is no real question. There lies before us at this moment a tumbler of it, taken within the last hour from the level above Newcomen-bridge, at the point where every alleged impurity would have acted upon it, being the lowest level of the canal. It is transparent and without any disagreeable flavour; and if the simple means of filtration were adopted, which ought and might be, with little comparative cost, it would be unexceptionable. It is to be recollected, that if the Royal Canal were in reality *stagnant*, this is exactly the period of the year that decomposing vegetable matter is most to be found in stagnant water, the taste and smell of which are unmistakeable.

It is deeply to be regretted that in advocating a favourite cause, partizanship is allowed to intrude itself so much as it usually does. The waters of the canals close to Dublin are, no doubt, not so pure as that of the Liffey *at Kippure;* but if they be taken from a proper elevation above the city, and treated as they might be, without the useless expenditures recommended for their filtration by sand, they will be, in our humble judgment, more than ample for our wants, and, perhaps, as pure, after all, as any other to be brought to our city. There might, and possibly would be a necessity *eventually*, when the city increases in population, *to lower the summit levels of each canal*, and thus to increase the supply, the expense of which would be of moderate amount; but we are strongly under the impression, that at present there would be no such need, nor for a long time to come. If that were done the Royal Canal alone would supply almost any quantity of water. It should be recollected we now have the water which supplies us within facile reach, with appliances already existing which can all be made available to save expenditure, the greater part of which will become useless and lost, if the proposed plan of the Corporation be carried into effect; also, that erroneous grounds have been assumed as to the necessity for the quantum of supply estimated. To assert that the inhabitants of Dublin—infant and adult—require "25 *gallons* per head per diem," is, we believe, without any real foundation on fact. It was originally thus calculated when the mania for "flushing" existed, and when the authorities of the day assumed that "*conveyance by water was the cheapest for getting rid of night-soil*," and that "*rivers were the natural outlets for the filth of cities*." Fortunately these errors are being at last seen through, perhaps in time to prevent a useless expenditure here for a worse than useless purpose.

Looking at the question in any light, 25 gallons per head per diem cannot be necessary. Dublin is every day becoming more and more a city of shops, warehouses, and offices. Whole streets are now appropriated to those purposes, and the use of *water* in such instances is almost nothing; whilst formerly each of the houses accommodated a family, or perhaps two. We believe it is idle to assume that the mass of the residents of Dublin at present either demand or could use 25 gallons each per day, were it provided; and we hope to show just grounds for the belief—that to provide *a high-pressure* supply for, at least, three-fourths of the inhabitants of Dublin, is utterly useless; they have neither means, nor power to avail themselves of it. We should not, therefore, be led away by misconception of facts. We should not act without full examination of what are our real wants, and what we require to supply them. We should well consider what we have within our reach, and not act on needless and problematical plans, which would cost us at least hundreds of thousands; and, to use a homely adage, "We should not throw out (even) muddy water until we are sure of clear."

In our next article we hope to analyze the plans of the Corporation engineers, and see from what sources they have sprung.

THE STRIKE IN LONDON—LAST ACCOUNTS.

THE members of the Trades' Conference, forty-two in number, held a special meeting at the Paviors' Arms, Westminster, chiefly to take into consideration the altered state of things occasioned by the defection of the operative masons from the Nine Hours' Movement. They sat two hours and a-half, with closed doors. They are understood, however, to have passed a resolution, embodying a proposition to the Central Association of Master Builders, the precise object of which did not transpire, and which will probably be brought under the notice of the executive committee of that body at their meeting this day (Tuesday). It is said that in another resolution they expressed their dissatisfaction—probably that is a mild term—at the conduct of the operative masons in deputing Mr. Harnott, the secretary of the central committee of the Masons' Society, with others, to treat with the masters' executive committee without previously obtaining the consent of the conference. It is likewise reported that a communication was read at the meeting from the Rev. E. A. Verity, B.D., incumbent of All Saints, Habergham, Lancashire, volunteering to come to London and deliver a lecture at the Freemasons' Tavern, with the view of influencing public opinion on the matters in issue between the masters and men, adding, that his ardent sympathies were with the men, whom he believed to have truth and justice on their side. When it is stated that Mr. Verity is described—if, indeed, he does not describe himself—as "the distinguished advocate of the working classes," "the able supporter of the short time movement," and "the successful advocate of the Padiham strike," no one can be at a loss to understand into which scale he will throw his influence; but still the metropolitan community will, probably, be curious to know what new light a clergyman from the country can hope to throw upon topics which, during the last two months, have been ventilated *ad nauseam*. The conference is said to have cordially entertained the rev. gentleman's proposal, and a communication to that effect would probably be forwarded to him by the post of last night. The Paviors' Arms Committee declared another dividend yesterday at the rate of 4s. a man to the operatives on strike, 6,454, exclusive of Trollope's men, who were paid each 12s. skilled, and 8s. unskilled. The aggregate sum distributed was £1,328 4s., or £2 8s. less than the amount paid away on the previous week. The recipients were also fewer than on the preceding Monday by 501, and by 522, compared with the week before that, showing that the men have either returned to work to that extent, or have ceased to be dependent on the funds dispensed at the Paviors' Arms. Subjoined is the official return of the money paid yesterday by the committee:—

* Paid with Woolwich men.

From enquiries made on Monday it was found that Messrs. Trollope had 271 men at work; Patman and Fotheringham, Theobald's Road, 71; W. Cubitt and Co., Gray's-inn Road, 852; Mansfield and Son, Henry-street, Gray's-inn Road, 87; Moxon, 868; Browne and Robinson, Worship-street, 69: Higgs, Lambeth, 154; Kelk, 674; and Piper and Son, 276. The whole of these men are reported to be working under the terms of the declaration.—*Times*.

ANTIQUITIES OF DUBLIN.—Dublin has two cathedral churches, one without the walls of the city known by the name of St. Patrick, the other in the midst of the city dedicated to the Holy Trinity, within the bounds whereof, the house of the Archbishops of Dublin was heretofore seated, as we learn out of Giraldus. Within the limits of the Church of St. Patrick, not far from the bellfry, we see that well (late inclosed and stopped up in private houses) at which the new converts of Dublin were baptised by him near the city, southward, as we have heard before out of Jocelin. The other consecrated to the holy name of the Trinity, commonly called Christ's Church, is built upon subterraneous vaults, whereof in the Black Book of that church we read thus: The arches or vaults were founded by the Danes before the coming of St. Patrick, and at that time Christ's Church was not founded nor built as it is now. Therefore St. Patrick celebrated mass in one of the vaults, which to this day is called St. Patrick's vault. Afterward, St. Patrick seeing the great miracles which God showed him, prophecyed and said:—After many years to come, a church shall be built here; and God shall be praised in it after all the churches of Ireland.—*Usher*.

EXPERIMENTAL RESEARCHES TO DETERMINE THE DENSITY OF STEAM AT ALL TEMPERATURES.—Mr. W. Fairbairn read a paper on this subject before the recent meeting of the British Association, in which he stated that the results obtained by his experiments were these—one cubic inch of water expands into 1670 cubic inches of steam at 212 degs. Fahrenheit, into 882 inches of steam at 251 degs. Fahrenheit, and into 400 cubic inches, at 304 degs. Fahrenheit, and so on. Mr. Fairbairn hopes by the time of the next meeting of the Association to lay before the section a series of results which would fully determine the value of superheated steam and its density and volume.—Professor Rankine expressed his extreme satisfaction with Mr. Fairbairn's experiments, which had obtained the only reliable results which had been obtained by any experiments on steam above 212 degs. The thanks of the Section were voted to Mr. Fairbairn.

E. B. Webb, Esq., for some years well known as engineer and superintendent of works on the line of the Derry and Coleraine Railway, was on the 7th of December last elected a member of the Institute of Civil Engineers in London. During the last six years he has been actively engaged in some of the most important engineering works in Brazil, in South America, and has just returned to that empire by last month's mail, on a very important mission connected with his profession.

IMPROVEMENTS AT THE NORTH SIDE.

Though we cannot chronicle progress at the same rapid pace in the northern districts of the metropolis as elsewhere, it is nevertheless *sure* if *slow*, and we are gratified to find that the attention of enterprising speculators is engaged in quarters hitherto totally neglected, and but a few years since considered almost valueless. The large area of reclaimed land bounded by the Circular-road leading to the popularly designated "smoothing iron" or bathing slip at one side, and the Royal Canal at the other, presented few inducements either to capitalists to build for domestic purposes, or to agriculturists, from the nature of the soil, for tillage or pasture. However, a gradually increasing traffic with the sister countries, in cattle and horses especially, has compelled dealers and those connected with the shipping to seek for homes, storage, &c., in the locality; likewise the multitude of workmen on the new graving-dock—a truly creditable and important structure—had to be housed. The new wharves, already noticed, several more of which are both required and intended to be continued to the lighthouse, and lastly, the projected Liffey branch line, have each considerably enhanced the value of property in the neighbourhood. Amongst the improvements effected recently by English residents of the class alluded to, we may mention that Mr. Wheeler, horse dealer, having purchased an extensive area at the junction of the eastern canal bank with Upper Sheriff-street, and adjoining the bridge, has built a superior cottage residence and stabling, &c., after designs by Mr. Lyons, architect—Mr. Whiteacre, the builder—and is now engaged in completing three others under same direction. Mr. Bollands, of similar occupation, has a farm and residence with out-offices on Church-road, notable for its English style and cleanliness, and has erected works under same architect's supervision.

Again, we notice that a respected fellow-citizen, Mr. Philip Brady, to whom belongs a large tract of some 50 acres, recently purchased under Incumbered Estates Court, has had a large portion of same plotted out in building lots, and commenced the erection, as a preliminary, of blocks of model semi-detached cottages; internally arranged in a very commodious manner, after English fashion, and to present a tasteful cemented front externally, also according to the drawings furnished by Mr. Lyons, to whom is entrusted the carrying out of all the arrangements. We understand that the all-important appendage of good water for drinking is as yet deficient, but we trust that in this and other matters of necessity, the public bodies—the Corporation and Ballast Board—will afford encouragement for improvement in a locality destined to be one of importance. There is a great want for a public fountain; and if the water mains were extended along Church-road, it would encourage building speculators. At Emily-place, in same locality, we also notice cottages for the humbler classes in course of erection; Mr. Douglas, builder.

EXCURSION TRIPS—RAILWAY FACILITIES.

During the past season the facility afforded to excursionists to travel cheaply and comfortably have been very great, perhaps indeed—if we except periods of rivalry between opposition companies—the greatest as yet. In Ireland the various railway companies whose lines communicate between the metropolis and Derry, Enniskillen, Belfast, Armagh, Drogheda, Navan, &c., northward; Cork, Limerick, &c., southward; and Galway, Ballinasloe, Mullingar, &c., westward; as also many of minor importance, have liberally encouraged those who desired recreation, change of scene, and improvement, to gratify themselves at very small cost. In like manner did the railway companies in England act; for we find excursions to London and back from Liverpool or Manchester for 12s. 6d., in eight hours' time, and *vice versa*; Liverpool to Manchester and back, for 1s. 6d. The "trips" from the English metropolis were almost innumerable, and the charges fabulous; for instance, to Boulogne and back, remaining eight hours, and including a passport, for 7s. 6d.; to Brighton and back, 3s. 6d. Three grand trunk lines—viz., the London and North-western, the Great Northern, and the Great Western—communicate between London and Liverpool, and equal advantages are offered by each to excursionists. Complaints of irregularity as to time occasionally occur, and no doubt are justified; but having had some experience, both during previous seasons and very recently, of the way those matters are conducted in England, we can bear personal testimony to the *general* punctuality and business-like arrangements observed. We notice, however, with regret, that although there were excursions from various parts of England *to* Ireland, there were none *from* Dublin thereto—a loss easily remedied by our steam-packet companies co-operating for a reduced fare at certain periods, so as to enable passengers to catch cheap trains, and which we have reason to hope will be favourably considered next season.

LOUGH ESKE CASTLE, CO. DONEGAL.

This castle, now being erected for Thomas Brooke, Esq,, on the site of the old house, is in the Elizabethan style. The east entrance front is 130 feet in length. The principal entrance will be by a handsome *porte cocheré* projecting a distance of 30 feet from the front of house, the spandrils and panelling over the entrance doors being sculptured with the "Brooke arms." The steps to principal floor are contained within the porch. The roof of porch is formed with Gothic ribs and traceried spandrils; the spaces between rafters filled in with rough plate glass; the sides of porch have buttresses, also traceried windows and embrasures, and octagon towers on front. The principal floor contains drawing-room, 25 by 18 feet; anteroom, 18 by 18 feet; tower room *en suite* with drawing-room, 17 by 17 feet; dining-room, 22 by 18 feet; morning-room, 17 by 15 feet; grand stairs, 24 by 13 feet; inner hall, 20 by 13 feet; back stairs, strong room, water-closets, bath-room, butler's pantry, cloak-room, and two bed-rooms. The windows to east front are five light oriels, three storeys in height. Embattled parapets and gables are introduced. The octagon towers on kitchen wing to be used as ventilation shafts. The great tower overlooking the Lough on north front is 22 feet square, and 80 feet high. The walls of the first floor are built with a batter; circular bower windows project from principal floor to north front, and on bed-room floor to east front. The tower is machicolated, crenelated, and embattled, has square turrets on angles, and circular tower on 4th angle springing from corbeling, flagstaff, &c., &c. The dressings throughout are of Mountcharles sandstone. The masonry is of finely punched millstone grit, of a superior quality, procured in the neighbourhood. The mansion stands on a most picturesque site, and the tourist, after emerging from the wild and rugged scenery of the famous "Gap of Barnesmore," cannot fail to be struck with the beauty and grandeur of the landscape around Lough Eske Castle. The Lough, with its islets and wooded banks, and the wild scenery of the mountains of Bluestack and Croghnageer rising out of the Lough 2,100 feet. This castle, when complete, will constitute a most pleasing feature in the view. The architect is Mr. Fitzgibbon Louch, C.E., of Sackville-street, Londonderry; the contractor, Mr. Albert Williams; clerk of works, Mr. Michael Stedman.

THE CEMETERY, LONDONDERRY.

The Corporation of the borough of Derry having advertised and offered a premium for the best design for the principal entrance and superintendent's residence to their beautiful cemetery, awarded the prize to Mr. Fitzgibbon Louch, C.E., of that city. The design is Gothic, and comprises a grand portal, 20 feet high to apex of Gothic arch, having richly mounted jambs and heads; buttresses and responds with finials and crockets on either side of jambs; the front faces panelled and traceried; over the arch on plain face the borough arms are to be sculptured in basso relievo. On the right side of entrance is the office, with Gothic windows, and buttresses with finials and crockets to each pier, and on angles, parapets are embattled. On the left of entrance is the side gate, and on the extreme left of centre an octagon tower, rising 42 feet high, each face richly panelled and traceried in compartments and belt mouldings. The pinnacle is richly carved and crocketted. The gates are highly ornamented. The wing walls are embattled, and the spaces between filled in with mediæval pattern railing; on the extreme end of the wings are octagon piers 22 feet high each, panelled with tracery pinnacles. The whole will occupy a frontage of 120 feet, and to be executed in Scotch sandstone. The superintendent's house is a neat Gothic structure of brick, with stone dressings, and to be erected within the grounds. Mr. Matthew M'Clelland is declared the contractor at £635. It is expected that the Honorable Irish Society will defray the expenditure.

DEATH OF MR. BRUNEL, C.E.

Our quarter of the world is already aware of this sad event; and as fast as time-conquering telegraph and flying steam can communicate, every inhabitant of the civilized globe shall mourn internally. Science has lost one of its brightest ornaments, society one of its best friends. The master mind that assisted in bringing to maturity, if not conceived (?) that Herculean task, the Thames Tunnel, and some of the greatest projects of the age, has "shuffled off this mortal coil," but left undying fame behind. Like many other great men, he was called on the point of "victory," and before his plans were fully consummated.

CHIPPINGS IN BELFAST.

The terrace of dwelling-houses at Elmswood, opposite the Queen's College (already described in the Dublin Builder), is now nearing towards completion. The proprietor, Mr. Thomas Gaffickain, purposes calling the property "the Queen's Elms," in commemoration of her Majesty having been driven through the avenue in her progress to the College, on the occasion of her visit to Belfast in 1849. The central house of the seven intersects the old avenue. The owner of the estate, Edward H. Clarke, Esq., has stipulated that the row of fine old elms shall be allowed to remain. The houses are built of patent red dressed bricks, tuck jointed: dressings round doors, windows, gables, parapets, &c., being of cut freestone, from near Dungannon. The houses are being erected by Messrs. Cannon and Co., of Belfast, their estimate being £7,350, exclusive of grates, chimney-pieces, hardware, &c. Mr. Thomas Jackson, architect.

Designs for Turkish baths for two gentlemen residing short distances from town have been made by the same architect.

The competition for £50 and £25 prizes for new concert hall promises to be a very brisk one, several gentlemen of standing having entered the lists. Let us hope that the committee will, in their decision, observe the motto, "Palmam ferat qui meruit," and that deserving candidates may bear off the prizes.

FREE MUSEUM AND LIBRARY,

PEEL PARK, SALFORD, NEAR MANCHESTER.

Perhaps one of the most excellent institutions in the United Kingdom combining recreation with instruction, is the above; and having, on the occasion of a recent visit to the City of Manchester, been enabled personally to judge of its advantages, we subjoin the following particulars of its history, which must prove interesting:—

"The Park was formed in 1846, when a sum of £36,540 was subscribed for the establishment of three Parks for the free use of the people in Manchester and Salford;—of this sum, £13,000 was expended in the purchase and laying out of Lark Hill and the adjoining land, which, when completed, was named Peel Park, in honour of that distinguished statesman Sir Robert Peel. It now comprises about 40 acres of land, was opened August 22nd, 1846, and is vested in the Mayor and Town Council of Salford. The grounds are laid out in a tasteful manner, with flower-beds, lawns, grass-plots, artificial lakes, &c.; and moreover there are two large and well provided gymnasia, as well as cricket, quoit, and archery grounds. The gravel walks extend about four miles over the park; a drinking fountain and ornamental water grace the lower part; and on the upper grounds are memorial statues of the late Sir Robert Peel and the late Joseph Brotherton, M.P., in bronze, and a marble statue of the Queen, erected to commemorate her Majesty's visit to Peel Park in 1851: these three colossal statues are the work of Matthew Noble, sculptor, London. At the east entrance is the Victoria arch —a lofty Venetian arched gateway, with side entrances—designed by T. G. Barker, architect, of Salford; at the west entrance are placed the handsome iron gates presented by Earl Ducie. A glacial boulder, of granite, weighing six tons; a mass of Vesuvian lava, basalt from the Giant's Causeway, two 68-pound Russian guns, from Sebastopol, and other objects of interest adorn the grounds near the museum buildings.

The free museum and library was originated in May, 1849, by the late Joseph Brotherton, M.P. for Salford, and E. R. Langworthy, Esq., mayor in 1848-50; and the library of reference, containing 7,000 volumes, was first opened on January 9, 1850; as also a museum of local natural history, in June of same year.

In 1852 the north wing and grand staircase, Messrs. Travis and Mangnall, architects, were added, by which the present fine reading-room was attached to the library. A free lending library opened on May, 1, 1854; and the museum building now consists of four library rooms, a reading-room, seven rooms and galleries, with a lower and upper corridor, in which are displayed the collections forming the museum. The sum of £13,107 has been received in pecuniary donations, besides which, valuable presents of books, paintings, engravings, and specimens have been made. The valuation of the contents of the museum and library in August, 1858, was £17,511, and of the building, £6000—a total of £23,511; all the property is vested in the Town Council of Salford, who levy a small rate under the powers of the "Public Libraries Act," for its maintenance and support.

The interior comprises reference and lending libraries; the former containing about 16,000 volumes on science and the arts, a good and consecutive series of antient and modern historical works, with theological, political, and general literature most useful to the class of readers frequenting the reading-room, *Specifications of Patents* (presented by the Honourable Her Majesty's Commissioners of Patents), from the time of James I., 1617, to the present, chronologically arranged, the value of which to intending patentees is incalculable; and the free lending library, containing 7,500 volumes, any of which may be taken to the homes of the borrowers, upon certain guarantees. The working classes avail themselves largely of the privileges of this department, and the large reading-room is frequented by about 380 readers daily.

Arranged on both sides of the corridor are groups of sculpture—casts from the antique, presented to the museum by the Honorable the Board of Trade—amongst which are "Venus de Milo," a statue of heroic size; "Dancing Faun" (Satyr), the "Gladiator," the "Discobolus," or Quoit-thrower; "Antinous," the "Belvedere Apollo," of heroic size; the "Fighting Gladiator," in vigorous action; "Germanicus," son of Drusus and Antonia, the niece of Augustus; it is also thought to be a statue of the God of Eloquence; there are also busts of Apollo, Clyte, Epicurus, Periander, Minerva, Trajan, Augustus, Pericles, Demosthenes, Indian Bacchus, Homeric Hero, and others; Roman and Grecian antiques.

In the staircase hall and grand staircase we noticed likewise several sculptured figures and busts, Elgin marble slabs, models, &c. Inserted in the walls of the corridors are enormous slabs of Assyrian sculpture, in low relief—the originals were found by Mr. Layard in the buried city of Nimroud (ancient Nineveh).

A copy of the Nimroud obelisk stands on the upper landing; this is considered as the most important historical monument brought from the city of Nineveh; it is of black marble; on each of its sides are five panels, sculptured in bas relief, with lines of arrow-headed, or cuneiform writing.

A cast of the valuable Rosetta stone is in a case on the landing, and contains three inscriptions—one in hieroglyphics, another in the Egyptian written character, called Demotic or Enchorial, and a third in the Greek language; these inscriptions record the services which Ptolemy the Fifth, Epiphanes, rendered his country.

The south gallery contains the paintings and works of art, contributed to form the present exhibition, and we recognised several previously exhibited in Dublin, amongst which were "The Wolf and the Lamb," and "Cottage Interior—Awaiting the Return from Market," by Mulready, contributed by the Queen; some architectural models, porcelain figures, statuettes, &c., &c.; numbering in all 230 works of art.

The table cases round the gallery contain bead ornamented articles of clothing, made by the Canadian Indians; shoes, clogs, sandals, and other protections for the feet, from nearly every part of the world; a variety of articles from India and China, grotesque and elaborate carvings in wood, stone and ivory, tools for common use by the eastern workman, models of machines, weapons of war, metal mosaic work, Chinese drawings, Hindoo paintings; antiquities of Egyptio-Greek, Greek, Roman, Celtic, and Anglo Saxon periods, vases and vessels of various forms, bronzes, iron weapons, and articles made of glass; one of the cinerary urns, found near Wilmslow, is filled with the bones of an ancient British chieftain, interred perhaps 1,500 years since; a collection of stone images from the Island of Cyprus, supposed to have been made by colonists from Egypt, who settled in Cyprus long before the Christian era, and represent the gods of Egypt (Isis and Osirus); with these figures are others of Greek form made of terra cotta, evidently intended to be "*toys for children;*" one is unmistakeably a "*hobby-horse,*" with which, perhaps, the little child of a Greek or Egyptian mother was amused and played with some 2,500 years ago; a few Celtic, Irish, and mediæval antiquities; a very fine Druidic bronze sword and an old Irish Methvin drinking-cup, cut square from the willow-tree, dug from a deep bog near Belfast; several axe-heads, of stone, called "celts;" flint arrow and spear-heads, samples of old glass painting, and needlework samplers, &c., &c., showing the skill and industry of fair fingers several generations ago.

The north gallery contains industrial products and manufactures, and upon the walls are arranged oil paintings belonging to the institution, chiefly portraits, and foremost is that of the late Daniel O'Connell. Further there is a natural history room, lined with upright cases, containing more than a thousand specimens of British birds, arranged in classified order; and a foreign natural history room, the walls of which exhibit, in classified arrangement, a series of more than 2,000 typical specimens of foreign ornithology.

In the north gallery, casts of Canova's Three Graces, Gibson's

Psyche borne by the Zephyrs, Bacchus and Ariadne, Diana Robing, and others are upon pedestals. Passing to the lower room of the south wing, the walls are occupied with an extensive series of chromo-lithographs, having to the untutored and uninitiated in art all the charms of the costly original drawings. In the middle of this room is a large marble group, "Venus disarming Cupid," by Davies, sculptor, London. There is also a statue of "Ruth," by Papworth; "Highland Mary," by Spence, &c., &c. The inner division of this room contains, perhaps, the most attractive object in the whole museum and exhibition—that is, the magnificent Indian silver bedstead. The frame of this bed is made of hard wood, and is plated over the entire surface with plates of silver, richly burnished with gold; it is covered with raised ornaments and figures of animals. The massive canopy over the bed is supported by twelve pillars, the cornice is elaborately worked, the velvet mattress, pillows, and bolster are rich purple velvet, with gold and silver embroidery, and the curtains are of the finest gold and silver tissue which the native Hindoo's love for gorgeous and dazzling display ever wove, or the luxurious taste of an eastern prince ever purchased. The inscription is as follows:—Presented to Her Majesty the Queen of Great Britain, by Baboo Deenarain Sing, of Benares, for the Exhibition of Art and Industry, 1851, manufactured by Manhoo Lohar. At the angles of the platform, upon which the bed is placed, are the state umbrellas, brought from Siam, and upon the platform are placed India matting of different patterns, with a scarlet cloth, embroidered in silver, forming a covering for a bullock; these articles have been lent by her Majesty the Queen.

In the Geological Room, in the wall cases, are displayed a series of specimens of fossils, and in the table cases are minerals, ores, metals, rock specimens, corals, and coralines. There are also exhibited models of extinct animals, and other geological and mineral specimens. At the end of the room is a colossal figure, "The Thracian Falconer," modelled by Mr. Leyland, of Halifax; a fresh water aquarium, a fern case, and other objects."

On the whole, the exhibition is a highly creditable one, and we refer with much pleasure to the feast of reason partaken of during a few hours visit to the Peel Park.

STATE OF THE LIFFEY—SEWERAGE OF THE CITY.

In our last number we published a report of the Corporation meeting, when Messrs. Martin and Whelan, Town Councillors, brought forward their respective propositions upon these very important questions, and we have since heard a good deal of discussion upon them. It is really gratifying to find that *the public* are at last beginning to take a *personal* interest in matters which so deeply concern themselves, but which hitherto they have—whether from delicacy in interfering with their representatives, or supineness, we cannot say—seemed to think little about.

Messrs. Martin and Whelan well deserve the thanks of their fellow citizens. They have brought information before them which, perhaps, would otherwise not have been made public; for there is a great deal of freemasonry amongst engineers and architects, as well as amongst doctors and watchmakers. They do not like the "outsiders" to understand the secrets of their trade; and, no doubt, our well-intentioned representatives will be considered as poachers upon engineering manors. But we would say, "Go on, gentlemen." You may not hit the nail directly on the head, but every blow you strike will awake an echo at least, to tell of your good intentions, and at last sneers may turn to thanks; for even those who sneer at the propositions of the *unpaid*, must feel they are at least worthy of the respect due to disinterestedness.

We do not agree with the plans of Messrs. Martin and Whelan, but we respect their intentions; and, perhaps, we cannot do better than republish the following letter, which we take from a cotemporary, as an exposition of our own ideas. We have well considered the question of the Liffey and the sewers, and we *almost* agree with Mr. Martin that, "*Mr. Rogers's plan for separating night-soil from water is the best;*" but we should like to hear more on the subject before we conclude. When we were about to decide upon a wife, we recollect well we were very anxious to hear the opinions of our friends, although over head and ears in love; now, we cannot say we are *in love*, for there never was a more unloveable subject than *the Liffey and the sewers;* but still we should be very glad to hear what our friends can say on the subject.

Omitting *beginnings* and *endings*, we republish Mr. Rogers's letter *in extenso:*—

THE RIVER LIFFEY—THE PLANS OF MESSRS. MARTIN AND WHELAN.

It is needless, perhaps, to refer to the simpler modes of effecting the purification of the Liffey and the sewers, which have been already fully described in your journal and elsewhere. They are, perhaps, too simple and inexpensive for the second city in the empire to think of adopting. There would be no need for heavy expenditures, contracts, &c.; and it is not at all unlikely that some such plans as now proposed, may be at last fixed on, especially as there is actually at the command of the Ballast Corporation ample funds which could be legally and most legitimately applied to such a purpose; and, somehow, all corporations seem to like plans that cost hundreds of thousands in preference to simple thousands. It becomes necessary, therefore, to examine into the merits of the propositions now made.

Although the public owe thanks to the gentlemen who have given their time, &c., to the present suggestions, they are, no doubt, prepared to hear without ill-will, the objections which present themselves.

The plans proposed are:—

First, by Mr. Whelan, T.C.—"To retain the waters of the Liffey by means of stop-gates, in order to make a floating basin for ships, and by covering up the bed, to destroy the present noxious emanations."

Second, by Mr. Martin, T.C.—"To construct intercepting sewers, north and south of the river, into which all the existing sewers might empty."

Mr. Whelan's proposition is grounded on the fact that the River Avon, at Bristol, has been dammed at the lower part of the city, and a spacious basin made for the accommodation of the shipping; and that, therefore, there is nothing to prevent the same course being followed in Dublin; but he will, no doubt, see, on a little further consideration, there is no analogy between the two places.

The River Avon above Bristol is one of the most sluggish rivers perhaps in the kingdom—its general fall is little more than perceptible, and it creeps along, winter and summer alike. The Liffey is at times a mountain torrent, artificially bent up at its mouth by the piers of the bridges and the quay walls of Dublin, until it is only to be wondered at that the floods which at times occur do not sweep away some of the obstructions; and the time may yet arrive when an easterly gale, driving before it an extra body of water up the river, on a maximum spring tide, and meeting an unusual mountain flood, will produce such a catastrophe.

The River Avon, on the other hand, is not pent up at all; for, although its original bed passing through Bristol has been converted into a basin, a "New Cut" has been made—in fact, a navigable river, which carries off all the surplus water above the level of the basin, and this "New Cut" discharges into the Avon below the entrance locks.

It must be plain that if such a "safety valve" be necessary at Bristol, where there are no mountain torrents to swell the stream, it would be infinitely more essential here, where there are. Let anyone observe the height of the flood waters against the arches of the bridges at present, and then imagine that stop-gates permanently held a body of water, say even 8 or 10 feet higher than the bed of the river, and he will at once see that there would not be space sufficient above that height, to permit the passage of floods through the arches. In fact, we have already too little water way within our quay walls and through our bridges, and to curtail it in any manner without "a safety valve," such as at Bristol, would be most dangerous. I do not believe that any engineer understanding hydraulic action could think of forming the River Liffey into a basin, without providing for the discharge of the natural overplus current; and that is scarcely practicable.

But, even if it were possible to construct the basin for ships, would the water being retained rid us of the filth discharged by the sewers? Surely not! Would it destroy the odour or prevent decomposition of the matter? No! Water has no more the power to prevent decomposition than it has to hold the gases emanating from decomposition. It has been assumed by engineers, that to cover or intermix night-soil with water is to destroy its foulness—but it is a simple fallacy; decomposition takes place beneath as well as above water, and its gases rise and discharge themselves into the atmosphere.

Water in the Liffey, held as proposed, and daily supplied with the contents of the sewers, would speedily become such a mass of noxiousness, that its emanations would be unbearable. The Thames now tells its own tale in contradiction to all the futile theories of assumed science, and proclaims the fallacies which have so long misled the public.

The principle of the second proposition—the construction of intercepting sewers—is unfortunately still "sub judice" in London, therefore, it has its advocates, and will have them no doubt, until time gives the same proof that it has already given against other unjustifiable practices which have made one of the noblest rivers in the world the foulest blot upon the country and upon its engineers. But although I do not expect that my poor voice will have weight enough to wholly counteract the evil, perhaps delay might be thought desirable, until London, which seems to be our pole-star, proves the capability of her intercepting sewers.

If there be no claims arising from the population whose only bathing-place is to be converted into a cess-pool—if there be none from the inhabitants of the whole shore from Ballybough bridge to Dollymount, which would soon be as foul as the shore of the Thames at Westminister—if those grievances make no impression upon the thoughts of the authorities of our city, there is another which may have its weight. They are just about to complete a work which does them honour; and the quays, almost from end to end, are laid down with an admirable pavement—a credit to the city and its authorities. In the name of common sense, let it not be ripped up to excavate for intercepting sewers. Let it rest, at least until the citizens have received some value for the large sum it has cost—and pleasure in enjoying so creditable a work. Above all, let the inhabitants be saved from the horrors of a *winter excavation*, extending from the King's bridge to the Dodder mouth on one side of the city, and from the same starting point, to the extreme end of the north-east wall on the other, presenting miles of mountains of mire.

A respite has more than once saved "the powers that be" from the consequences of an unjust judicial punishment. Let Dublin have a respite, and in the interim there may be a hope for the citizens, for its poor bathers, and for the people of Clontarf. Mr. Martin, whom I have not the honour of knowing personally, says, in a recent letter published on the question, that "Mr. Rogers' plan for separating water from night-soil, seems to be the best. That perhaps a law to compel the owners of every house to provide a receptacle in the front area, or in the rere of each house, in which house a public company could place a tank suitable in size for the number of residents, fitted with couplings to the soil pipe or pipes, might prove effective, and that the company might find it profitable to provide tanks and machinery to remove and replace empty tanks." &c., &c.

I have to offer Mr. Martin my acknowledgment for his valuable adhesion to this proposition, and for his complimentary observation. It is ten years since the plan was published, detailing all the arrangements he alludes to, and was fully explained by public lectures at the Dublin Society—given by me, at the request of the Sanitary Association. But it has been said that "it takes ten years to make the public understand a novelty."

It will scarcely be doubted that I believe Mr. Martin's proposition for a company to be a wise one. I shall now, however, only record my conviction, that one day or other, some such plan will be universally adopted. I may not live to see it; but the day will come—because it is the simplest mode of saving rivers and sewers from pollution, and cities from infectious emanations; and also of saving for the purposes of agriculture that which was specially designed for it.

Jasper W. Rogers.

Biographical Sketches.

FRANCIS JOHNSTON, R.H.A.

Of this talented architect, to whom the architectural importance of Dublin is so much indebted, we regret to state, no memoir has yet been written. As it is not supposed that we can intuitively recount the life of one who has lived so many years before our time, and as we have been unable to learn where to derive assistance from his family, the following poor account, obtained from such available sources as local histories afford, must only be taken as something in hand, waiting for the time when his memory shall be honoured by a writer better acquainted with his professional life.

We would premise that the name of this architect is seldom written properly. It is Johnston, and not Johnstone or Johnson, as frequently found in most of the works describing the edifices of Dublin.

Another mistake connected with his name appears by the following extract from *Whitelaw's* History of Dublin, quoting *Malton*, who states that "in 1785 an elegant suite of rooms were begun to be added to the Rotundo, and the Rotundo itself to be much beautified in its external appearance, by Mr. Richard Johnston, architect, assisted by Frederick Trench, Esq., to whose exertions and taste in architecture these buildings are much indebted. The foundation stone of the new rooms was laid by the Duke of Rutland, on the 17th of July, 1785; . . . They form a pleasing range of building, 101 feet in extent, parallel with Cavendish-row, the east side of the square. The new rooms are superb; they consist of two principal apartments, one over the other, 86 feet long by 40 broad; the lower is the ball, the upper the supper and tea room. There is a smaller ball-room on the ground floor, 60 feet by 24, . . . and several lesser rooms for cards and refreshments." *Mulvany*, also, in his *Life of Gandon*, mentions "the commanding talents of Mr. Richard Johnston, an architect of whom any country might be proud." It will be perceived that the Christian name is different, from which it might be presumed they were distinct persons; otherwise who was this Richard?

Francis Johnston, however (taking the date into consideration) may have directed the above works at the Rotundo, and under the advice of Mr. Trench, as it appears that Johnston was residing at Armagh from 1786 till 1793, superintending the erection of the tower of the Cathedral there. He is believed to have been a native of that city.

In 1670 St. Andrew's Church Dublin, was rebuilt, the form injudiciously adopted being that of an ellipse, imitated from similar churches executed but not used for an auditorium at Rome. Stone gutters having been used, the main timbers of the roof and the upper part of the walls became so dangerously decayed, that about 1793 it was found necessary to rebuild the edifice. All above the lower belting was removed, by which the old form and dimensions were unfortunately retained; it is 80 feet by 60 feet, and 43 feet high to the cornice, and is, as was foreseen, so unfavourable to the voice, that a preacher of ordinary lungs cannot be heard with any distinctness by a great proportion of the congregation. The exterior is uninteresting; the interior, however, is richly decorated, and includes some details escaping beyond the usual routine in design of the day. The design included a tower, 230 feet high, in the Gothic style, the two first storeys of which alone were finished in consequence of the want of funds; the entire expense of the church, which was opened 7th March, 1807, including the new organ, was nearly £22,000.

The parish of St. George being formed in 1793, the church was commenced shortly after, and finished in 1802. It stands completely insulated in the centre of a partly rectangular and partly semi-crescent-like area, denominated St. George's-place, and surrounded by houses. The exterior dimensions of the body of the church are 92 feet in front by 84 feet in depth, having a projection in the rear for the vestry room and parish school. The whole is of hewn stone; the entrance is formed by four fluted Ionic columns, 3 feet 6 inches diameter, supporting a pediment. This portico is 42 feet long by 15 feet projection, and over it rises a handsome steeple diversified in plan at each stage, and terminating in a spire surmounted by a cross, the whole most judiciously treated, to a height of 200 feet from the pavement, forming one of the most prominent features of Dublin. The interior is 84 feet by 60, and presents the remarkable feature of the side aisles being separated from the body of the church by a partition, which partition supports the gallery extending over the aisle, so that no columns are necessary; some space, however, is lost. The cost is said to have been £70,000, though about £50,000 is generally named in the descriptions. This is one of his best productions.

At the Parliament House, a fire broke out on the 27th February, 1792, in the House of Commons, and entirely consumed that noble apartment, which was of an octangular shape. It was rebuilt by Johnston, so as very nearly to resemble the old room, but of a circular form. When purchased in 1802 by the Bank of Ireland, this building was found to require extensive alterations in the interior, to fit it for the new purposes. The Court of Requests and the above-mentioned Commons room were pulled down. Preparatory to doing so, liberal premiums were offered for designs by the governors, but none were adopted, the alterations being placed under Johnston's directions. The cash-office, then erected, one of the finest rooms in the city, is 70 feet by 53 feet, the walls panelled with Bath stone, and ornamented with 24 fluted Ionic columns of Portland stone on pedestals, and supporting a rich entablature. It is lit by windows and by a lantern, 50 feet by 30 feet, the ceiling of which is 50 feet from the stone floor. The library contained a perfect model of the whole of the Bank, the work of nearly three years' labour, and which distinctly showed the construction of this office. It is an object of much interest to visitors.

The Richmond General Penitentiary and House of Correction, for four hundred persons, situate in Grangegorman-lane, was commenced in 1812. It is 700 feet in front and 400 feet in depth; the material of dark blue limestone, the details of granite; the whole cost is put down at upwards of £50,000.

To the Foundling Hospital, situate in James's-street, and of late years known as the North Dublin Union Workhouse, Johnston added the infirmary, a plain substantial structure, finished in 1810. The building is about 150 feet long, three storeys in height; each of the twelve wards is nearly 30 feet by 20 and 14 feet high—calculated to hold twelve beds each—well ventilated. To this institution he added the chapel, of Gothic architecture, which was finished about 1816. It is placed in the centre of the buildings on the south side of the interior court, and is 70 feet by 50 feet inside; the nave or centre aisle 70 feet by 15 feet, is divided on each side by six pillars formed by a union of six others, and which supports the gallery and the roof. This chapel had the defect of being unfavourable to the voice of the preacher, when the pulpit was placed, as originally, at the extreme end of the chapel in the recess.

At the Castle, he directed (1813 to 1817) the alterations in the Wardrobe tower for the Records; and erected (1807 to 1814) the Castle Chapel, in the decorated period of the Gothic style of architecture, the lower windows of a depressed or Tudor curvature, questionably judicious The material is of the calp or common black Irish stone, and the arrangement internally consists merely of a choir, 73 feet by 35 feet, without either nave or transepts. Amongst the external sculptural decorations—which were executed by the Smiths—are numerous corbel heads of kings, bishops, &c., under hood mouldings of windows; and the internal carvings, by Stewart, an eminent artist, are very beautiful. The ceiling shows groined arches of plaster work; the panels of the gallery are of carved oak; with much other ornamental work and stained glass. The total cost was £42,000.

Whilst engaged in these works last named, his talents were directed to designing another important public edifice. The first stone of the Post-office in Sackville-street was laid by his Excellency Lord Whitworth, on the 12th of August, 1815, and was proceeded with with a degree of rapidity then unexampled in this country. It is three storeys in height; of granite, 223 feet, in front, 150 feet in depth, and 50 feet high to the top of the cornice. A grand portico of Portland stone, 80 feet in length, has six Ionic columns, each 4 feet 4 inches in diameter, which are considerably larger than that of any other in the metropolis; the pediment is surmounted by three statues by the younger Smith, representing Hibernia, Mercury, and Fidelity. The expense of this large building, completed in 1817, was over £50,000.

To Lord Whitworth's administration is also due the addition, about 1816, to the North front of the Viceregal Lodge, in the Phœnix Park. This is ornamented with a pediment supported by four Ionic pillars of Portland stone, from a design by Johnston. The whole façade has been new-faced, to correspond with this portico, before which time the structure presented a very plain appearance of brickwork only.

The Hibernian School, for the children of soldiers, in the Phœnix Park, was originally built in 1766–7. To this, wings and other additions were erected, about 1816, in a manner much to the credit of Mr. Johnston; these include the dining-hall, 100 feet by 40, and 32 feet high. The entrance gate, in the Gothic style, to the Royal Hospital, Kilmainham, removed from Usher's-island, was erected about 1818. This is the last work but one to which we find his name attached in the city of Dublin. The last is also not the least, and well exhibits the architect, artist, and man. On the 29th of April, 1824, he laid the first stone, in Abbey-street, of an edifice destined for the Royal Hibernian Academy of Painting, Sculpture, and Architecture, of which Institution he was the founder and the president. It was to the interest of Sir William Chambers, the celebrated architect, in a great measure, with King George the Third, that the artists of England were indebted for the foundation of the Royal Academy of Arts in London. It was, we believe, entirely owing to Johnston, that the scheme of the Academy was suggested, and but for his most liberal assistance it might never have existed. The building is of three storeys in front; the centre of the lower one is formed in front into a recess by two fluted Doric columns, which support the wall above. The room beyond the entrance hall, and approached by a short but spacious flight of stone steps, being the first exhibition room, is 40 feet by 20, used for water-colour drawings; communicates by a large archway, with the great saloon or gallery for oil paintings. This room is 50 feet by 40 feet, and is lighted by a lantern, whose sashes are inclined at an angle of 45 degrees, whereby the light is cast on that part of the wall only on which the paintings are to be suspended, while the spectators are left completely in the shade. This arrangement of lighting a gallery, it is believed, was first introduced by the President West, in his picture-gallery in Newman-street, London, and erected about 1820. It is, no doubt, the best method for the purpose. A very ingeniously contrived octangular staircase leads to the council room, keeper's apartments, and which are all in the front building. The first stone records that Johnston "munificently founded this building for their (the artists) use, to form a National School of Art," and by its erection at his own private expense, besides purchasing the fee-simple of the ground, he has raised for himself—says *Wright*, in his Guide—"a monument such as the pride of kings could not confer, and has left to posterity a name to be cherished and revered, while the arts shall have an existence in the land."

He held for many years the office of architect to the Board of Works. We are quite unacquainted with the buildings, if any, in the interior parts of Ireland, that he may have been commissioned to design; and have only left on record that he died on the 14th of March 1829, and was buried in St. George's burial-ground (adjoining the Royal Canal), on the north side.

As already noticed, Johnston added greatly to the ornamentation of the city. Though exhibiting originality in Italian architecture, he did not decline to attempt the Grecian and Gothic styles, and though the latter works may not show so good an appreciation of the peculiarities of the style, as we are now accustomed to look for, they are of great merit, especially when it is recollected that the details, more particularly of the Castle Chapel, do not abound in Ireland to the same extent as in England, and at the time this chapel was erected, there were not so many publications on the subject as at present. Did he travel in England? is a question that naturally arises in one's mind; who was his original instructor; and had he any pupils? are among the many questions to which we should have wished for answers, before printing this attempt, and we shall be happy to learn further authentic particulars.

GEORGE ENSOR.

The Rotundo, adjoining the Lying-in-Hospital, is a noble apartment, 80 feet in diameter, by 40 feet in height. The walls are decorated with 18 Corinthian pilasters, the intervals between which are occupied by windows enriched by architraves and pediments. The ceiling is divided by concentric circles, intersected by radii—a design simple but effective. It was built in the year 1757, for a place of public entertainments, and in it have been likewise held a large number of important public meetings. Its acoustical properties are admirable. Some of the present decorations on the exterior of the building appear to have been added some years after by Johnston.

This, we regret to say, is all we have been able to find relating to one who has left so good a specimen of his talents.

Correspondence.

NEW LINE OF COMMUNICATION BETWEEN THE CITY AND CLONTARF.

Sir—I claim no originality of idea for this project, nevertheless, it may have some novelty for many of your readers. By previous numbers of your journal, I observe that with your usual watchful eye, and very judiciously, you direct much attention to the long-neglected north side, where there is ample opportunity—nay, necessity—for vast improvement. You tell us that "Annesley and Newcomen bridges, by their construction, present serious impediments to public traffic;" also that "the waste space between Clontarf road and Ballybough-bridge, now a swamp, ought to be reclaimed and made a park of." Very desirable, no doubt, but what think you of this? I recently met with a Ballast-office map, dated A.D. 1717, and published before railways were thought of, on which it is clearly defined, that the veritable Church-road, as also East-road, and another near the site of new graving-dock, now in existence was projected to be continued across the sea to Clontarf-road, and the holdings of various tenants at either side clearly marked out.

Now a railway *does* exist there! Suppose arrangements were made with the company, by the proper authorities, for a pedestrian communication—for the present—along the sloped embankment from the Wharf-road to Clontarf-road, and thereby forthwith save an unnecessary journey of at least *a mile and a-half* to inhabitants at portion of the north side. Hereafter it *might* prove further desirable to enclose the area between the railway and Annesley-bridge for a park or building purposes, or, by sluice-gates, make a lake thereof; and then form *a route for vehicles* along the pathway site, communicating with the quays, docks, &c.; and when the projected bridge across the Liffey, at the Custom-house, shall have been constructed, bring Irishtown and Clontarf within *twenty minutes* omnibus communication of each other, now three quarters of an hour at least direct by other vehicles. S.

[The project merits consideration.—Ed.]

DUST!

Sir—May I ask, how is it that where there are such vast spaces about the city that require filling in, and for which "dust" would be such a valuable article, the system of ash-pit cleansing is so defective and expensive? In London, Manchester, Liverpool, and other cities, dust is sought for as a compliment, and removed gratis; *here* it is quite a compliment to get it removed at a price. Contracts are entered into in the above-named places with the local Corporations, and the contractors' carts are sent round every night. Contractors there, by cleansing "for nothing," make fortunes of the material alone, which is here regarded as useless.

By the excellent series of articles in your journal on "Sanitary arrangements," "Water supply," &c., you have exposed many palpable defects in our system, and I trust that you will permit insertion of these few remarks.

A Householder and Subscriber.

THE TERMINUS IN HARCOURT-STREET.

Sir—Doubtless you have taken notice of the novel and pleasing front of the railway terminus in Harcourt-street, and the admirable arrangement of its piazza, allowing sufficient space for *several* vehicles to receive passengers at the same time, while their utmost exposure to weather is while stepping across the footway. Within a few days, however, I find, to my utter dismay, that the piazza is to be closed in with iron railing, and undo all the comforts previously prepared for the public. I freely grant that annoyances might spring up in other forms, as is too often to be found in such places, but surely in those days of well-regulated police it is not to be dreaded; and at the worst, a trifle to some poor person to look after the piazza each morning would remedy all. Architecturally viewing the matter, iron railings of any kind are injurious to the appearance of fronts, particularly where columns are introduced, and are merely regarded as an excrescence, but disappearing of late, as may be seen by some of our public monuments.

Church Building Intelligence.

[We are requested by Mr. Moran to state, that the water-font in new Augustinian church, Galway (see page 112), described to be in the *Ionic* order—whereas the style of the edifice is *Gothic*—was not specially constructed therefor, but designed several years since by a Galway artist, and is only intended to answer a *temporary* purpose.—Ed.]

The new church of St. Augustine, at Drogheda, is to be built from designs by Mr. M. B. Moran, architect. Internal dimensions, 145 by 60 feet; style, early Gothic, bordering on tracery period; comprises internally, nave, aisles, lateral chapel, tower, sacristy at south-east angle, and connecting cloister. Nave will have arcades with polished marble piers.

The tenders for roofing, &c., Armagh Cathedral, as per plans, &c., by Mr. M'Carthy, architect, were as follows:—M'Gaughey (Armagh), £16,722; Robert Farrell (Dublin), £13,009; Thos. Byrne (Belfast), £9,896; Connolly (Armagh), £8,339. Mr. Byrne has obtained the contract, and made a supplemental contract to finish the interior for £5,400, and the Church is to be ready for consecration in June, 1863.

During a recent visit to Ballinasloe we noticed that a new Roman Catholic church had been erected there, for which on enquiry we found that plans had been originally furnished by Mr. M'Carthy, architect, but not carried out according to the intentions of that gentleman.

The new church at Mayo Bridge was designed by Mr. M'Carthy, and not Mr. John Murray, of Dundalk (as learned from some of our contemporaries), who is acting as clerk of works; Mr. M'Gaughey, of Armagh, the builder. It will accommodate 1,400 persons, and cost £3.000. Style, Gothic.

A church of small dimensions is being built at Nire, a mountainous district in the County Waterford. Same architect.

A large conventual building has been erected at Enniskillen. It is three storeys high, and immediately adjoining are two-storey school-houses, containing apartments 84 by 24 feet, in which female children are instructed.

The interior of the new parochial (R.C.) church of St. James, at Dublin, is nearly completed, and a grand stained glass oriel window, by Messrs. O'Connor, of London, has been erected. The design illustrates the birth, death, and majesty of the Saviour; and forty-three figures are introduced. The window is 30 feet in height and 14 in width, divided into five lights with geometrical tracery.

A new church has just been erected at Clonroche, Wexford.

The Marquis of Waterford has subscribed £50 towards repairing the cathedral of Derry.

The Remonstrant Presbyterian congregation of Newtownlimavady have erected a manse at Tullyhoe; style, Elizabethan. Fitzgibbon Louch, Esq., C.E., Londonderry, the architect; Mr. James Allison, Newtownlimavady, contractor.

[Several handsome villas have been designed by the same architect, and are about being erected in the vicinity of Londonderry.]

Convent of Mercy at Enniskillen.—A large and commodious convent, three storeys high, has been built within the last two or three years by the Very Rev. Dean Boylan, on one of the prettiest sites on the banks of the beautiful Erne, immediately adjoining the town of Enniskillen, by subscription. Immediately adjoining the convent, spacious schoolrooms, 24 by 84 feet, two storeys high, have been built, in which at present are nearly 200 female children.

Notes of New Works.

The Board of Public Works has commenced building an additional wing to the female training department, fronting Talbot street, in connection with the model schools at Marlborough-street; and we understand that a corresponding wing is in contemplation, both harmonizing in architectural character with the existing Italian structure. We understand Mr. John Nolan, of Meredyth-place, is the builder. The same body is also about having a coastguard station built at Clontarf, on the North Bull.

In the town of Belfast twenty-five ordinary drinking fountains are being erected. We hope the movement will extend to many towns of less importance, where fairs and markets are held especially.

The dwelling-house at Glenmarine, Brittas, Co. Dublin, on the recently purchased estate of Thomas M'Adam, Esq., of Limerick, has been improved both externally and internally, under the directions of Mr. Lyons, architect; Mr. Whiteacre, builder.

The Magnetic Telegraph Company have extended their wires to the Curragh Camp.

The Town Council of Derry are about erecting an entrance gateway and superintendent's house at the cemetery adjoining the town; and the Port Commissioners are forming an embankment, roadway, and stone bulwark extending from Strand-road to graving-dock.

The statue erected at Portrush, in memory of the late Rev. Dr. Adam Clarke, has been inaugurated. It is said to be a truthful historic likeness, and is in the usual attire of the celebrated divine. The statue, when raised on the plinth in front of the obelisk, will stand eight feet high, and will be visible from the different approaches to Portrush. The obelisk is forty-five feet high. The laying the foundation-stone of the Memorial Chapel, at Portstewart, took place at the same time

A movement has been set on foot for erecting, on a plot of ground at the rere of the Royal Cork Institution, a public museum and library.

Alterations are being made to premises at Carlow, lately taken by the National Bank. W. F. Caldbeck, architect; Mr. Faircloth, contractor.

The monumental oratory previously mentioned at Glasnevin Cemetery, is in course of completion. Mr. Lyons, architect; Mr. Wm. Crowe, contractor. It will be a novel but suitable and permanent structure of chiselled Foxrock granite, not Scotch stone, as intended.

AMERICAN ITEMS.

A handsome church has been erected by the Irish and Acadian French of Yarmouth, Nova Scotia, at Boston.

The foundation-stone of the new church of St. Patrick at Norristown, has been laid.

Mr. T. Molson, of Montreal, has at his own expense erected St. Thomas' Church in that city, also expended £50,000 in founding a College to which he contributes £1,000 annually.

Milwaukee, aside from its superabundant dust, is one of the handsomest cities in the Union, and comprises a large number of splendid private residences, with liberal surroundings in the way of parks, gardens, and fountains. A large portion of the town is built on made land excavated from the hills and filled into the wild rice swamp, traces of which may be seen here and there. There are very few buildings of other material than the yellow Milwaukee brick, which, however, built into neat architectural designs, makes handsome edifices. There are several buildings constructed of Chicago marble, and quite ornate in execution. The churches, with the exception of the Cathedral, are quite ordinary affairs externally. An immense amount of building is in progress. On every street are being constructed private residences or extensive blocks for business. Indeed, the air of Milwaukee conveys an impression of prosperity, with the exception of the non-commissioned vessels lying at her docks, though that is not peculiar to the City of Bricks. The New Hall Hotel, recently erected, is one of the most colossal and magnificent buildings in the world (a description will be found in a previous number of the Dublin Builder), and quite throws in the shade structures of a similar character in Europe.

An appropriate site for a permanent church structure, capable of accommodating at least 2.000, persons has been purchased. This, and the erection of a temporary building to be used for service until the permanent structure shall be completed, has been commenced. The contract was taken up at a cost of 2,300 dollars—it is now roofed in, and will be completed and ready for use before the 5th of October next.

The recently constructed aqueduct about four miles above Port Byron, which conveys the waters of the canal over the Seneca River, is an immense structure. It is second, as a gigantic work of art, only to the Suspension Bridge at Niagara, though not by any means similar to it. Its cost was not far from two hundred thousand dollars.

The new burying-place, called the Fort Hill Cemetery, at Auburn, is a notable place. The first thing that strikes the gaze of the visitor is Logan's monument—a stone pillar about fifty or sixty feet high, and ten feet broad at its base. It was erected some eight years ago, by the company which owns Fort Hill, to the memory of that noble Indian chief, who, it is thought, died in this city. The hill has the appearance of having once been an Indian fort, as earthworks surround the brow of the elevation, and warlike implements have been excavated from the ground. Among the principal vaults, is the most extensive one of the Pettitt's, which cost 8,000 dollars, being built of fine marble and stone, with some tasteful ornamental work displayed upon the inside, as well as the outside. Another vault, constructed wholly of iron, and owned by John Curtis, cost 5,000 dols.

The New York State Prison, which occupies a central position in the city, was built in 1816 forty-three years ago. The boundary walls are each 500 feet long, and at least 20 feet high. The different mechanical departments in the prison are under the charge of superintendents and agents both of the State and of the gentlemen to whom the labour of the convicts is given for a consideration agreed upon by the contracting parties, and comprise coopers' and tool shops, a manufactory of agricultural implements, large shoe shop, in which hundreds of hands are actively employed, harness shop, furniture and upholstering rooms, carpet-weaving room, in which five hundred yards of all kinds of carpeting are daily manufactured, and wool-carding and spinning rooms. Wool is furnished in its natural state, and here undergoes those changes which are at last completed in beautiful carpets, in fine cloths, &c, &c, One of the sights of the prison is the dining-room. The dinner procession of convicts is an interesting sight. The workmen in each shop form in single file, and each man takes hold of the jacket of the man ahead of him, and thus they march to their dinner, which is (as is also breakfast) taken on the lower floor; supper being provided for them in their cells. There are now 797 convicts in the prison, the lowest number during the past ten months. Several of the prisoners are now undergoing punishment by wearing bonnets of iron, or frames which cover their heads. and by carrying the ball to which is attached a heavy chain, which is also fastened to the leg.

In close proximity to the State Prison is the Insane Convict Asylum—the only one in the State, or in the United States, which is a separate building, built expressly for the purpose. It is a large and substantial structure, and now contains 57 insane criminals.

A ride out to Owasco Lake gave me an opportunity of seeing what is generally conceded to be one of the finest sheets of water in the State. It is about a mile and a-half wide. at the widest point, and ten or twelve miles long. With a fast nag and a fast driver, I have seen the whole of Auburn to-day. Governor Seward's residence is finely located in the centre of a little forest of shrubbery. The building is not showy, nor as expensive as many others in this place, but is, however, substantial and comfortable. The weather is quite cold here. and overcoats are generally worn. I may write again from Auburn.

Wheeling, nine years back, had but one place of public worship; Wheeling now has 18 churches and three chapels, of which the cathedral and church of St. Alphonsus, in the town of Wheeling, are among the finest specimens in their kind of high architectural design that adorn any city in the Union.

Laying the Corner-Stone of a New Church in Brooklyn.—The corner-stone of a new Catholic Church, to be called St. Peter's, was laid with appropriate ceremonies, recently, in the presence of a concourse of people estimated at from 15,000 to 20,000. The spire of the church will be 170 feet in height. There are to be 202 pews on the main floor, capable of seating 1,000 persons, with room for 400 more in the organ gallery. The church and presbytery are to be finished in June, 1860, when a school is to be commenced on Hicks-street, upon which the work will cost 20,000 dollars.

The opera house at Cincinnati cost half-a-million of dollars during erection; it was designed and ornamented by some of the most skilful architects in America. The Merchants' Exchange is a spacious and expensive building, and the library is said to be a complete model.

Monthly Railway Memoranda.

There is a chance of adjustment of the differences which have hitherto retarded the formation of a railway from Cork to Macroom. A meeting was held recently, at which Mr. Leader and Mr. Colthurst C.E., and other gentlemen attended. Two projects came before the county under the sanction of professional talent. One of them—the southern line—introduced by Sir John Benson, proposes starting from the terminus of the Cork and Bandon Railway, and leave that line at about a mile distant from Cork, cross through the lands of Wilton, under Wilton demesne, and through Bishopstown to Ballincollig, within a short distance of the gunpowder mills. From Ballincollig along the valley of the Bride, and in almost a level line to Crookstown, and from Crookstown to Macroom; the entire distance, inclusive of the mile of the Cork and Bandon Railway, being 23¼ miles. The estimated cost. for a double line of rails, is £115,000, or under £5,000 per mile. The northern line, by Mr. Colthurst, C.E., proposes to start from the new bridge of Macroom, run close to the coach road, pass through the vale of Ummara, and along the lower part of Coolalta, to the lawn of Oakgrove. It crosses the Dripsey stream, and then entering the valley of the Lee runs under Innislinga abbey through the valley of Inniscarra and on to a point near the Cork waterworks, or it may by an additional expenditure be carried to a point near the heart of the sea.

The protracted disputes between the two principal railway companies in Ireland, the Great Southern and Western, and Midland Great Western, are in course of amicable adjustment, preliminaries having been agreed on, and the details of a permanent arrangement referred to arbitration.

Two schemes for connecting Derry with Letterkenny, by railway, are on foot, one proposing a line from the latter place to Johnstown, there to join the Derry and Enniskillen Railway, at a cost of £100,000 for 14½ miles in length; another to extend the Derry and Lough Swilly line to Letterkenny.

The report of the directors of the Great Northern and Western Railway states that the agreement between the Midland Great Western Railway of Ireland Company and this company has been completed. An act has passed for the extension of the Great Northern and Western line from Castlereagh to Castlebar. Much of the land between Roscommon and Castlereagh is already purchased, and it is expected that the contractors will be in possession of the whole this month. The report of the engineers (Messrs. Fowler and Barry) state that since the last report the works of the railway between Athlone and Roscommon have been proceeded with by the contractors in an energetic manner. The earthwork, bridges, and culvert are far advanced towards completion, and considerably more than one-third the length of the permanent way is laid. The supply of permanent materials now on the ground and the state of the works enable the contractors to make rapid progress with the remaining length of the permanent way, and at the present time more than a mile per week is being laid down.

The affairs of the Waterford and Kilkenny Railway appear to have arrived at a crisis. The Government Loan Commissioners have, it is stated, taken possession of the line, in virtue of their claim for money advanced, and are to let it on lease to other parties. There are said to be three competitors for the tenancy, viz., the Waterford and Limerick Railway Company, the Great Southern and Western Railway Company, and Mr. Nixon, or the company which that gentleman represents. It is said that the Waterford and Limerick Company have made the highest bid, and are likely to the lease.

NEW ULSTER BANK ESTABLISHMENT.

The new Ulster Bank, in Waring-street, is now nearly completed in all its external parts, and when the building will be finished it will be an ornament to Belfast. There is nothing certainly equal to it in point of architectural beauty in Belfast or in the North of Ireland; and, viewing it as a public building, the only thing to be regretted regarding it is that it is situated in a place where it never now can be conspicuous. The building is erected on a piece of ground 119 feet in frontage and 130 feet in rere, and is three storeys high. The façade measures 91 feet in length and 95 feet 6 inches in depth. From the ground to the top of the parapet in front, the height is 55 feet, and the whole height, including a group of figures which are to ornament the building, is 77 feet. The style of architecture adopted is the Italian, and all the details are carried out in strict conformity with the best period of the Roman school. For the best design the directors and committee of the bank offered a premium of £100, and this stimulated architects into a sharp competition, as is evident from the fact that there were no fewer than sixty-seven competitors. The design of Mr. James Hamilton, of Glasgow, was selected, and in accordance with that design the edifice has been erected. The work was begun in February, 1858. The foundations were laid with piles, each 42 feet long, formed with Memel timber and concrete of blue lias lime, covered over with freestone flags, 13 inches thick; and the work of laying the piles was necessarily a tedious one. Nothing short of such precautions to secure proper foundations would have sufficed to have secured stability for the structure to be raised upon them. The building starts with a base of Scotch freestone, two feet nine inches in height all round the front and east and west wings. The window cases all round the sides and back of the building are of cut freestone; and the inside and back of the edifice are built of Moore's perforated brick, two feet thick. These perforated bricks are very much esteemed by builders, on account of their superiority, in every respect, over the old solid brick, which they are rapidly superseding. We have stated that the building is three storeys in height. First, we have the basement storey; next, a cash-office storey; and third, a residence storey. The basement storey is eight feet high in the clear, and is arched over. This storey is made fireproof. The cash-office is approached by a flight of twelve granite steps, at the top of which we have a magnificent portico, with eight coupled Doric columns. You then enter the cash-office by a capacious folding door, and approach the counter in front of you. This office is 68 feet long, by 40 feet wide. The space in front of the counter contains 1,080 square feet, and is abundantly sufficient for the accommodation of the public. The interior of this place is very handsome and capacious in the extreme. It is lighted by a spacious dome, 73 feet in altitude. The dome will be filled in with stained glass, figured, and exquisitely designed and adorned. Four columns, each 28 feet high, of Aberdeen granite, highly polished, with marble bases and Corinthian capitals, support the dome; and round the walls are pilasters to correspond. The floor is, or will be, covered with encaustic tiles of different designs and colouring. The windows will be of stained glass, and in perfect keeping with the features and character of the building. Altogether, this department will be extremely beautiful. Along the right wing are situated the director's dressing room, retiring room, manager's room, director's room, secretary's room, and apartments for the inspector and law officer; and on the left, in front, is a large room for the accommodation of the committee or shareholders; and on a line with it, running to the rere, are the strangers' room, book-keeper's apartment, and safe and book-safe. Over the Doric columns; on the outside of the building on the second storey, rise eight Corinthian columns, above which runs an enriched frieze, elaborately sculptured and surmounted by a Corinthian cornice and blocking. Above that again we have a panelled parapet, enriched piers, and antique vases, with a symbolic group of three figures, the principal and centre one being Britannia, with heraldic devices under it. Along the side compartments and returns are Doric and Corinthian pilasters, which correspond and harmonise with the pillars and the character of the edifice. Between the pilasters and the columns there are beautiful arch-topped windows, the whole being finished with highly enriched spandrils and mask keystones. The wing rooms in the business storey are 17 feet 3 inches in height, and the floors, which are fire-proof, have iron joists, filled in with concrete, and one-half is flagged with Arbroath stones, and the other half boarded. The rooms on the third storey are 16 feet 6 inches in height, and well adapted for the purposes for which they are intended. They consist in front of a bed-room, bath-room, drawing-room, and dining-room; and on the right wing are a nursery and bed-room, and on the left are pantry, kitchen, and scullery. The entire building is fireproof, the residence floor being upon Fox and Barrett's principle. When finished the cost of the building will be about £20,000, exclusive of a good deal of extra work which must be done to the surrounding walls and buildings, which will partly be taken down, in order to have them in keeping with the design of the building itself. Mr. James Moore, who represents Mr. Hamilton, the architect, and so efficiently superintends the progress of the work going on at the building, informed us that the bank will not be ready for business until about June, 1860. We may mention that it was Mr. Moore who built, with so much credit to himself. the Ulster Arcade for the Messrs. Lindsay, and coupling the Ulster Bank with the Arcade, we think he may be proud in having his name associated with the erection of two such splendid buildings.—*Belfast Mercury.*

Miscellaneous.

RIO JANEIRO GRAND THEATRE, AND OTTAWA BUILDINGS COMPETITIONS.—We learn from the *Bath Express* that Mr. Green, architect, of that city, has obtained the second premium for his design for the New Grand Theatre, at Rio Janeiro, which will cover more than four times the area of that on which the Covent Garden Theatre stands, and it will cost more than half a million of money. The competitors embraced architects from London, Paris, Vienna, Berlin, New York, and other principal cities in the world. Twenty-five designs were selected for the final competition, and the first premium of £2.250 was obtained by a German (Mr. Walheneldt, living at Rio de Janeiro; the second of £900 by an Englishman (Mr. Green), and the third by an American (Mr. Swan, of Philadelphia.) Not only were the premiums offered by the Brazilian government very liberal, but it redounds greatly to its credit that the amounts were paid to the successful competitors immediately the award was made. In Canada, too, Mr. Green, as also Messrs. Fuller and Stent, all of them professionally educated in Bath, have attained high honours in the competition for the new Houses of Parliament, to be erected at Ottawa. These structures will be built on a scale of magnificence worthy the grandeur of that fine country, of which Ottawa is to be the metropolis. Sixteen architects competed for the honour. out of which number Messrs. Fuller and Stent are the successful candidates. The following is the exact position awarded them:—Parliament Houses—Mr. Fuller, 1st premium, 1,000 dollars; Messrs. Stent and Laver, 2nd do., 400 dollars. Departmental buildings—Messrs. Stent and Laver, 1st premium, 1,000 dollars; Mr. Fuller, 2nd do., 400 dollars. Governor's residence—Mr. Cumberland, 1st premium, 400 dollars; Messrs. Fuller and Green, 2nd do., 200 dollars.

EXPLOSION OF GAS.—Lord Limerick has narrowly escaped severe injury from an explosion of gas. Some alterations to the gas-fittings were being made in his house near Limerick, and, through some carelessness, the lower portion of the dwelling, including the servants' hall, became impregnated with gas. A person holding a lighted candel at this time came into the room, and immediately a thundering explosion took place which shook the entire edifice, reducing the whole of the furniture in the servants' kitchen and adjoining room to pieces, and causing considerable damage in other portions of the building. Several of the servants received slight burns in different parts of the body, and were removed to the hospital; but fortunately no life was lost. The library, which is placed directly over the room whence the explosion originated, was also the scene of some injuries. Lord Limerick himself had only left this room a few moments before the explosion occurred.

CRYSTAL PALACE.—VICTORIA BRIDGE.—A model of this great work of engineering skill (a description of which appears in this No. of DUBLIN BUILDER, and which is to be opened in November next) has been placed in the centre of the nave at the Crystal Palace. The model, which is the property of the Canadian government, being constructed to scale, visitors may form some conception of the gigantic character of the enterprise which has succeeded in bridgeing the St. Lawrence, by a structure only 176 feet less than two miles in length, as well as some slight notion of the want of through communication between Canada and America, which would commercially justify so costly an undertaking. A large collection of photographs, taken at various times during the construction of the bridge, kindly lent for exibition by Sir Cusack P. Roney, affords much information respecting the progress of the structure. To those persons who may be desirous of comparing the proportions of this great bridge with those of similar works in this country, the model gallery of the Crystal Palace affords ample opportunity, as in it will be found models of the Britannia Bridge over the Menai Straits, the bridge over the Dnieper at Kieff (the longest suspension-bridge in the world), the Saltash bridge on the South Devon Railway at Plymouth (one of the latest and most gigantic works of the late Mr. Brunel), the Crumlin Viaduct, and other great engineering works. As adding to the interest of the subject, it may be mentioned that the passengers by the Great Eastern will probably be in America at the time fixed for the formal opening of the Victoria Bridge; and it will be a coincidence long to be remembered, that the successful completion of two such great works as the Great Ship and the Victoria Bridge should have resulted at the same period, and through the labours of English engineers.—*Building News.*

[A recent visit to the model gallery of the Crystal Palace, and inspection of the model in question, fully confirms the opinion of our valued contemporary.—ED.]

NEW MUZZLE-LOADING ORDNANCE.—Sir William Armstrong recently obtained protection under the patent law, for an improvement in muzzle-loading ordnance and projectiles; which he thus describes:—"In rifled ordnance as heretofore made (other than breech-loading ordnance) the loading, owing to the necessary tightness of the fit, presents serious practical difficulties which it is the object of this invention to avoid. For this purpose I cause the projectile, fitted with suitable fillets or projections on one side, to enter the piece of ordnance by one and to leave it by another track, the projectile and the piece of ordnance being so adapted to each other as that the projectiles on entering, and throughout the loading of the piece of ordnance, shall be free and easy to move, but, on leaving the piece of ordnance, shall be sufficiently tight to preserve the steadiness essential to precision of action. The projectile, in addition to the ordinary projections or projectiles adapted for rifled ordnance, is furnished with a certain piece or pieces of a soft material, which will crush and prevent any jamming or too great tightness as the projectile leaves the piece of ordnance."

AMERICAN STEAM FIRE-ENGINE.—The *Scientific American* states that one of the newly-constructed locomotive steam fire-engines lately ran twenty miles on a common road in two hours. The whole weight of the engine water and 9 passengers, was 1 [illegible] 0lbs, 9,000 lbs. being the weight of the engine alone.

ARTIFICIAL STATUARY MARBLE.—Mr. Jobard, of Brussels, has invented an artificial statuary marble, which is to be prepared for sculptors in a liquid state, and can be moulded with the plaster figure. It is said to be pure and spotless as Carrara—transparent, polished, and hard as the real substance taken from the quarry.

From Milan we learn that a subscription is mooted for an equestrian statue of Napoleon III., to be erected in front of the white marble minster or duomo that towers over the plains of liberated Lombardy.

A communication from Rome says:—The magnificent statue of the Marine Venus, which was discovered a few weeks ago in some excavations made in the gardens of Julius Cæsar, not far from the Portese Gate, has been definitely purchased for the Imperial Museum of St. Petersburgh, for the sum of about 50,000f.

NOTICE.

Orders for Subscriptions to, and Advertisements for, THE DUBLIN BUILDER, *will be received at the Proprietor's Office,* 17, LOWER GARDINER-STREET. *Wholesale Agents*—Messrs. W. H. SMITH & SON, *Sackville-street* (*from whom* "THE DUBLIN BUILDER" *may be had at every Railway Station*), *and* GEORGE MASON, 24, *D'Olier-street.*

Payments (by Post-office Order or otherwise) for Advertisements in this Journal are to be made to PETER ROE, at the Printing Office, 42, Mabbot-street, Dublin.

TO TIMBER MERCHANTS AND BUILDERS.

Now in the press, price 7s. 6d.

THE CALCULATOR; or, TIMBER-MERCHANT'S and BUILDER'S GUIDE.

By William Richardson & Chas. Gane, of Wisbech.

Containing about 500 pages, 12mo. Should be on the desk of every one connected with the trade, and will be found invaluable for casting and checking invoices, etc., both in reduction of quantity and money, with other information. Order early of

JOHN WEALE, High Holborn.

Published every FRIDAY Evening in time for Post. Price 5d. Stamped.

THE WEEKLY AGRICULTURAL REVIEW and Irish Country Gentleman's Newspaper,

conducted by Professor CHARLES A. CAMERON, assisted by eminent scientific and practical writers.

Each Number contains several Original Articles on Agriculture, Horticulture, and the various departments of Rural Industry; Sporting Intelligence; Literary and Scientific Notes; Reports of Agricultural Meetings and Exhibitions; an ample Summary of News—Foreign and Domestic—including the latest Telegrams; a full and accurate Report of the Markets; a special Report of the Corn Trade, Etc.

Subscription—Stamped, £1 per annum.

"Agricultural Review" Office,
7, Great Brunswick-street, Dublin.

THE LAMP, a Weekly Illustrated Journal of Literature, Science, the Fine Arts, etc.

Edited by James Burke, A.B., Barrister-at-law, Author of "Abridgment of Lingard's History of England," "Memoir of Moore," "Memoir of Edmund Burke" (prefixed to Speeches), "Annual Abridgment of the Statutes," etc.

The Lamp contains deeply interesting Tales; beautiful Illustrations of Places and Events of Interest; Lives and correct Portraits of distinguished Characters; Essays by eminent writers; Poetry of a high character; Reviews of, and Extracts from, the newest and most agreeable Books; Abstracts of important Lectures; entertaining Varieties; and Notes on important Events.

Six Copies sent prepaid for Sevenpence, and the Monthly Parts for Eighteenpence a quarter.

The extensive circulation of the Lamp among all classes (to which that of no other Catholic periodical approaches) offers a most favourable medium to Advertisers. The Terms are—*in the Weekly Number:* Not exceeding 4 lines, or 36 words, 2s.; for every additional line, or 9 words, 4d. *On the Monthly Wrapper:* Not exceeding 4 lines, or 36 words, 1s. 6d.; for every additional line, or 9 words, 3d.

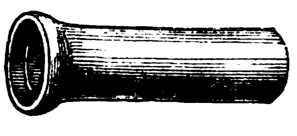
London: The Catholic Publishing and Bookselling Company (Limited), Charles Dolman, Manager, 61, New Bond-street, W., and 6, Queen's Head Passage, Paternoster-row, E.C.; and J. Mullany, 1, Parliament-street, Dublin.

VALUABLE BOOKS, relating to ARCHITECTURE, BUILDING, and CIVIL ENGINEERING,

on SALE, at greatly Reduced Prices, at BRADLEY BATSFORD'S, 52, High Holborn, London, W.C.

Architectural and Scientific Books bought or exchanged. Catalogues sent Post free.

DOULTON'S SEWERAGE PIPES.



JOSEPH KELLY, the City Saw Mills, 66 and 67, THOMAS-STREET (opposite John's-lane), and 128, FRANCIS-STREET, has always a large stock of these Sewerage Pipes, as also of Oven Tiles, Chimney Tops, &c.

66 & 67, Thomas-street, & 128, Francis-street.

FIRE BRICKS, of every description

and size; Furnace Blocks, Flue Covers, Chimney Cans, Vent Linings, Gas Retorts, Sewerage and Water Pipes, Vases, Fountains; Balustrading; Fire Clay, ground and selected, manufactured at the Garnkirk Works, near Glasgow.

A large Stock always on hand, and for Sale by

*** *Agents wanted throughout the United Kingdom.*

Agent for Dublin—
W. L. Ellwood, Esq., 146, Great Britain-street.

PURE AND BRILLIANT GAS LIGHT.

GAS IN COUNTRY MANSIONS.

IMPROVED PATENT HYDRO-CARBON GAS APPARATUS.

Joshua Edmundson and Co. having the exclusive right to Manufacture and Sell this Gas Apparatus, call attention of the Public to this most valuable invention. It is peculiarly adapted for Lighting Gentlemen's Mansions, Colleges, Mills, Manufactories, Railway Stations, other Country Establishments, and Public Gas Works for Towns.

The Apparatus will produce more Gas from a ton of Coal than any other, and can be so arranged in the erection that the Cooking of an establishment, of whatever size, can be effected without expense, no fuel being required beyond that used in making the Gas.

Particulars as to price, size, scientific merit, etc., and the most satisfactory reference to parties for whom it has been erected in this country, will be given by

JOSHUA EDMUNDSON AND CO.,
34, 35, 36, Capel-street.

Estimates for all parts of the Kingdom given, free of expense.

Country Towns lighted at a very small cost.

Agents for Milner's Fireproof Safes.

ROGERS'S Patent Peat Charcoal,

for Sanitary Uses generally: for Disinfection of the Dead, Purification of Sick Chambers, Filtration of Water, Purification of Ships, Stables, Cattle Sheds; for Packing Provisions, Eggs, Butter, &c.; and for Agricultural Purposes. Manufactured by The Health of Towns Improvement Company.

Works and Depots:—Derrymullen, Robertstown, Co. Kildare; Newcomen-bridge, Dublin; 5, Donegal-square, North, Belfast. General Agent—Joseph G. Thompson.

THEODOLITES, LEVELS, CIRCUMFERENTERS,

Mathematical Drawing Instruments, Scales, Rules, Tapes, T Squares, &c.

JOHN ARCHBUTT, 20, Westminster Bridge Road, Lambeth, near Astley's Theatre, respectfully calls attention to his Stock of the above articles, manufactured by superior workmen. The prices will be found considerably lower than ever charged for articles of similar quality. An illustrated price list forwarded free on application. 8-inch Dumpy Level complete, 6 guineas; 10-inch ditto, 8 guineas; 14-inch ditto, 10 guineas: with compass, 1 guinea each extra. Best 5-inch Theodolite, divided on Silver, 18 guineas.

MAW AND CO'S MOSAIC PAVEMENTS.

GEORGE HOLMES and CO., 10,

Sir John Rogerson's Quay, are prepared to furnish Architects and Builders with designs and estimates for Mosaic and Encaustic Pavements for Halls, Conservatories, Corridors, etc., and execute all orders with expedition. These Pavements being "imperishable" will be found a highly-decorative and most economical substitute for ordinary floors and their perishable coverings.

Benthall Works, Broseley, Salop.

GENTLEMEN ABOUT TO BUILD,

or make Alterations in Premises, will find it to their advantage to consult

JOHN S. SLOANE, C.E.,
Agricultural and General Architect,
5, RICHMOND-STREET, NORTH, DUBLIN.

The Dublin Builder.

Vol. I.—No. 11.

PASSING EVENTS.

TOPICS replete with interest to both the scientific and mercantile communities, have presented themselves in such rapid succession during the preceding month, that we find it impossible in our available space to give to each sufficiently lengthy and special consideration.

How strangely coincidental that scarcely had the death-bell ceased its tolling, and the remains of one of England's brightest luminaries in the scientific hemisphere been lowered into their last resting-place; than the world was again taken by surprise at the unexpected announcement of the death of another in the same profession, to whose abilities and energy in developing possibilities, mankind in every quarter of the globe is indebted. Robert Stephenson was destined to improve and perfect what his father "George" had begun, and nobly has he sustained the reputation of his ancestor. To both father and son the world at large owe more for social and commercial advancement, than to the whole phalanx of political agitators and economists, reform champions, &c., &c., of the age. Ireland alone—though not the scene of his triumphs even partially—has directly profited by his genius in surmounting apparent obstacles to facility of intercourse with the sister country; for by his conception and skilful completion of that stupendous work, the Britannia Tubular Bridge, she has been brought nearer those on whom her progress most depends; nearer in a commercial sense, as evidenced by the rapidly increasing traffic and importance of business transactions between the two countries; and in a social, as affording better opportunity for mutual appreciation and the dispelling of ancient prejudices, which happily, day by day, *are* gradually vanishing. This month—and probably before the sorrowful news shall have well reached our transatlantic friends—another mighty monument of his genius—the Victoria Bridge at Montreal, and now the greatest structure of its kind in the world—is to be completed. Particulars of this work may be found in other portions of the journal, and a perusal will serve to show the great moral courage, the wonderful skill, the unceasing energy, that was brought to bear to ensure the successful completion of such a herculean task. With its inauguration in January, will be associated a universal regret for the melancholy event that deprived the projector, the satisfaction and pride of witnessing his work accomplished. It has been with truth remarked that Mr. Robert Stephenson was peculiarly fortunate, both in the character of his works being utilitarian, and in his projects being matured—indeed society has reason to congratulate itself on this fact; for we believe that many giant minds exist unknown in every age, and many glorious projects are conceived whose maturity would immortalize their authors, but die with them in obscurity for lack of opportunity to realize them. Next to this, the engrossing topics in every grade of society are the "Great Eastern," that monster of the deep—beside whose huge proportions all other monsters sink into insignificance—where will be her destination?—what are the probabilities of her success as a commercial speculation? The consideration of these queries we must leave to longer heads than ours, but in an artistic capacity we must confess that her vastness seems to be her only recommendation. A more graceless, bulky, or unwieldy mass could scarcely ride the deep than she is. For this expression we are prepared to incur censure from a *few* of the enthusiasts, who proclaim her "a miracle of art;" yet for the one who may be found to differ, twenty will agree with us that she is certainly not in contour an artistic model. Will she answer her purpose?—will she conveniently carry an army of 10,000 soldiers fully equipped for a campaign?—will she achieve, in all weathers, a minimum speed of 15 knots an hour?—will her vastness and her build lessen the motion to be experienced by her passengers, and the inconvenience of sea sickness?—will she weather a storm? These are every-day questions yet to be answered by time and a few trips across the troubled waters of the broad Atlantic; but without professing to be an authority in nautical matters, we confess to number amongst those who entertain misgivings as to her seafaring qualities; though, with *all* wondering at her vastness, and admiring her appointments.

Would that it became our pleasure to announce this month, with reference to the London strike, the same satisfactory adjustment of differences as in the case of the Dublin carpenters a short time since; but such is not permitted, for dissension yet prevails, and as long as a shilling dividend is obtainable, for many of those who have warred against the declaration, it appears likely to remain so. Slowly, but surely, however, the masters appear to be gaining ground; and have maintained the lock-out, though in a considerable minority, against a multitude of opponents, with a determination and unanimity of purpose truly remarkable, but very characteristic of John Bull. From the most recent authenticated returns by the Central Association of Master Builders, we learn that the following is the result. The numbers of men returned to work under the declaration—

For the week ending	September	17,	were	4,242
" "	"	24,	"	7,620
" "	October	1,	"	9,037
" "	"	8,	"	10,740
" "	"	15,	"	11,692
" "	"	22,	"	12,226

"It was also reported that on the 22nd October, 2,700 men (in addition to the 12,226) had entered establishments under a shop rule embracing the spirit of the declaration." Hence it would appear that about 6,000 skilled hands still remain voluntarily out of employment; and assuming that their families represent even an average of three for each man, it is clear some 18,000 human beings are, from this misguided movement, thrown into a state of self-imposed mendicancy. We read figures and facts here relative to this strike with comparative indifference, but to become an eye-witness awakens the senses to pity and concern, not perhaps for the wrong-headed individuals themselves, but for their starving wives and innocent offspring. Recently we saw distributed in different districts of the English metropolis, groups of the malcontents lazily lolling in the vicinity of the buildings, they were a short time since assisting in rearing; regarding them with an air of fixed and sullen determination, and heaping curses both loud and deep—accompanied, when opportunity offered, with hooting and blows of missiles—on their fellows who had resumed. We anxiously hope for the total cessation of hostilities, for the odds now are so unequal, that the contest must speedily come to a close.

THE PROGRESS OF ARCHITECTURE IN IRELAND.

BY (THE LATE) JAMES GANDON, ARCHITECT.

(Continued from page 107.)

THE ingenious Dr. Young, late Bishop of Clonfert, in the Transactions of the Royal Irish Academy, has done little more than confine himself to the theory of the Gothic arch—how far it has peculiar properties of sustaining incumbent weights under peculiar circumstances. In stating the sentiments of different writers, concerning the origin of the Gothic arch, his lordship refers to Stukely, who considers the pointed arch and slender pillar to have been invented by Abraham—an opinion that Warburton adopted in his notes on Pope's Fourth Epistle, where he calls them calf cathedrals. This idea is probably taken from the thirteenth chapter of third book of Albertus, who has these words—"Etenim ducendi arcus rationem traxisse homines hinc puto. Nam cum viderent trabes duas junctis capitibus posse, imis pedibus divaricatis, ita fermari ut mutuo innexu, paribusque contra se ponderibus sisterent, placuit inventum." Stukely had nothing more to do but to give these trabes or beams their branches and leaves, to make his patriarchal arch. In the like manner the author of the History of the Gothic Building at Batalha supposes the Gothic architects attended to the proportions of the human frame. This notion is taken from the first chapter of the third book of Vitruvius, the title of which is, "De sacrarum Ædium compositione, et symmetrus, et corporis humani Mensura."

Vasari, more than two centuries ago, has given the result of every inquiry that can be made into the origin of the Gothic style. "There is," he says, "another species of architecture, which, in its ornaments and proportions, is very different from the antique and from the modern, nor is it used at present by good architects, but avoided as barbarous and monstrous, being entirely deficient in order, so that it may be rather called disorder and confusion. It was introduced by the Goths, who, after they had destroyed the ancient fabrics, and the architects were slain in war, introduced arches of the fourth point, and filled all Italy with this monstrous style of building." He adds much more, well worth perusal. I must, however, observe, that Dr. Ledwich has disproved, in a very satisfactory manner, the Goths being the authors of the style, though it certainly originated in the dark ages; and however slight may have been held the opinion of that great man, Sir Christopher Wren, as to the Gothic style being of Saracenic origin, there is every reason to believe that his observations on this subject are not without foundation; and the annexed print[*] I consider will, in a great measure, serve to illustrate Sir Christopher's opinion. The drawing from which the print is taken was given to me by that truly esteemed artist, Mr. Daniel, whose illustrations of the architectural buildings of India do him much honour. The print represents the entrance of a Hindoo temple; the antiquity is so very remote that the time cannot, from any authority whatsoever, be ascertained. It is cut out of a granite rock, and dedicated to Mahudeva; it is situated near Eya, in Bahar, East Indies. The arch is not only pointed, but also decorated with quatrefoil between the mouldings, and it is only substituting angels and saints instead of the elephants, and it may be adapted for an entrance to a cathedral. It may be suggested that this strong illustration has not been, in after periods of Asiatic architecture, resorted to; but many reasons might have interfered; it may have been thought too sacred, and were even this inference incorrect, the style was surely sufficient for an ingenious architect to emulate, and indulge his fancy in forming a new style of architecture. There appear additional circumstances in support of these conjectures; for in the Asiatic researches, in Chambers's Account of the Ruins of Mavalepuram, they evidently assimilate to the Gothic taste, being surmounted by arched roofs, composed of two segments of circles meeting at a point, &c. And Fra Bartolomeo relates in his voyage—"There have existed Christians from the time of the martyrdom of St. Thomas on the coast of Malabar. The missionaries visiting this place, who were skilled in drawing, might have brought specimens to Italy, &c.; and as the architects were chiefly priests or monks, they might have preferred this style of building to that of the Greek or Roman, as deviating from their temples and being more impressive to their ideas of Christian worship." But to proceed with this sketch of Irish architecture. On the arrival of the English, and their settlement in the country, the erecting of castles became indispensably necessary to the security of their persons and property, and the continual feuds between the settlers and the natives multiplied fortresses to an incredible number; for it appears, about the 7th of James I., that every person possessing the greatest portion—that is, 2,000 acres—was bound, within two years, to erect a castle on its lands, with a strong court or bawn about it; every person of a middle portion—*i.e*, 1,500 acres—within the same time, to build a stone or brick court, with a bawn about it; and every person of 1,000 acres to encourage his under-tenants to build about the castles.—*Vide* Harris's Hibernica, p. 128. In consequence of the regulations, according to Pyner's Survey, made 1618, there were built 107 castles with bawns, 19 castles without bawns, 42 bawns without castles, 1,897 dwelling-houses of stone or timber. We find the dwelling-houses are thus described—they were composed of clay, covered with ferns, heaths, or straw, as similar to those described by Holingshed—"The greater part of our buildings in cities and good towns of England, consisteth only of timber, cast over with thick clay, to keep out the wind, &c."

These houses were framed with timber, the panels wattled and pargetted over with coloured clay or mortar. Dick's coffee-house, in Skinner-row, Dublin, was of this sort, and so convenient, roomy, and elegant, as to be inhabited by the Earl of Kildare in 1534, and called the Carbrie. Moryson, in 1589, thus speaks of Irish houses —"The houses of Dublin and Waterford are, for the most part, of timber, clay, and plaster; in general they very seldom keep out the rain, the timber not being well seasoned, and the wall being combined with clay only, not with lime and mortar tempered; and many gentlemen have castles built of freestone, unpolished, and of flints, or little stones; and they are built strong for defence in times of rebellion, for which cause they have narrow stairs and little windows, and commonly they have a spacious hall, adjoining to the castle, of timber and clay, wherein they eat with their family. The mere Irish sleep under the canopy of heaven, or in cabins, wattled and covered with turf."

About 1633, the Earl of Strafford, Lord Lieutenant of Ireland, began, for that age, a princely mansion,[*] situated at Jigginstown, about a mile eastward of Naas. Tradition says, the bricks of which it was erected were brought from Holland; they are smaller, better made and coloured than any now in use. From the foundation to the first floor this edifice is erected with stone, extremely well built; the length of the front is about 360 feet, and it had 24 windows on the ground floor, which was vaulted, at each flank three in a square pavilion, raised higher than the front; under these are vaulted kitchens, faced with bricks, in good preservation. Being informed that in the construction of this building there were many circumstances worthy of attention, I availed myself of an opportunity that presented itself of examining the remains of this building, in the year 1783, with the late Earl of Portarlington, when accompanying him to his seat at Dawson-court. On inspection of these vast ruins, we discovered nothing peculiar, except the incrustation or cement with which they were covered internally. Having with some difficulty broken off a piece, it had all the appearance of having been an oil cement. To the south-west is a square stone building, and at some distance another; probably these were designed for flanking towers, for all the houses at this period had such defences, or were castellated; but as this house was never finished it produced very little excitement for imitation in building, and the truly calamitous situation of Ireland shortly after this period, was a preventive check to any further improvement in civil architecture; and the state of building continued nearly the same as already described until the revolution in 1688, and the face of the country long continued to show nothing but dreary scenes of ruined churches, castles,[†] and poor, wretched hovels of houses; even those of the gentry were every way unworthy to mark the residence of opulence or distinction. Little more was at this period thought of than individual security. Even so late as the year 1779,

---

[*] Mr. Gandon evidently intended to illustrate this essay with engravings.—ED.

[*] Allen, Viscount Allen.—This family, long residing in the kingdom of Ireland, was transplanted from Holland about two hundred years since. James Allen, Esq., came from that country to Ireland, sent over as a factor for the Dutch, in the latter end of Elizabeth's reign. Being very handsome in person, and possessing great skill in architecture, he was much esteemed and consulted by the most eminent nobility and gentlemen in their buildings, particularly by the Earl of Strafford, Lord Lieutenant of Ireland, in his large intended edifice near Naas, and laid out the plan of his house at Mullinahack, near Dublin, leaving it to his son, Sir Joshua, for whom he acquired a considerable fortune.—*Vide* Archdall's Irish Peerage, vol. v., p. 181.

[†] There are very few castles at present remaining in Ireland of any considerable magnitude, when compared with those of England. It must be allowed that at the time of Henry VIII., when the cathedrals, religious houses, together with the castles of the barons, embosomed in their woods, existed in all their Gothic pride, England exhibited a scenery that must have afforded surprise, and would have delighted even a Greek or Roman architect of the Augustan age; the lofty and towering spires of the cathedrals uniting to a peculiar style such variety of fantastic ornament, executed with materials so slight in substance, yet possessing such strength, combined with such great statistical knowledge in the art of cutting, and the formation of masonry, as in the arches, &c., to support the incumbent weights On the other hand, we may observe, that the Greek or Roman architects, with all their refinement, knowledge, and taste, were frequently obliged to have recourse to enormous blocks of stone or marble, added to such thickness of wall as to form artificial works in the construction of their edifices, in order to resist the injuries of time, and hand them down to posterity. The present generation, particularly the Society of Antiquaries, sensible of the genius shown in many of these works, are investigating, with the discrimination they merit, their several beauties; while the painter of landscape seeks every occasion to add our ruined Gothic buildings to embellish the glowing colours of his canvas. The many excellent engravings of these subjects will hand down to posterity ruins daily crumbling into dust, and will show that if our ancestors had not that pure taste of Greece or Rome, yet they had one more suited to the times, though often wild and extravagant, yet beautiful, and, in some instances, both in the design and construction, sublime.

Mr. Arthur Young, in his Tour through Ireland, makes the following observations:—"Another circumstance to be remarked is the miserableness of many of their houses. There are men of £5,000 a-year in Ireland who live in habitations that men of £700 a-year in England would disdain. An air of neatness and order, dress and propriety, is wanting to a surprising degree around the mansion; even new and excellent houses have often nothing of this kind about them."

The fine arts, which have made such considerable advances in every civilized country in Europe, were slow in being unfolded in this island until within the last fifty years. This slow advancement towards improvement has not been occasioned by the absence of genius, taste, or culture of the fine arts, for it is a melancholy fact that the professors of the arts of the highest branch and of celebrity to their several departments, have, for the want of encouragement, been compelled to seek for patronage and employment in the sister isle.[*] It can only be observed, that the great improvement made within the few years past in every kind of domestic comfort, combining taste and elegance in the different buildings for resident noblemen and gentlemen, clearly evinces that it was only necessary that the fostering hand of liberal encouragement should be resorted to, in order to bring forward genius and merit. I may add, that many of the villas lately erected in Ireland combine diversity in the arrangement of their plans with external beauty of elevation, which has materially contributed to banish the monotony of the gable end residences which were so common all over the country parts of Ireland, where not a single tree or shrub was allowed to decorate them, or contribute to embellish the variety of beautiful scenery the country possessed; for I may here be permitted to ask, can any country be mentioned that abounds with more diversity of attractions, constituting all the attributes of landscape scenery than Ireland, and every way adapted for architectural embellishments, either for the bold and aspiring residence of the lordly baron, the graceful villa abbey, or the sequestered cottage? Here the glowing pencil of the enthusiast in landscape painting may range with increasing delight, while the poet may waft his inspirations over mountain, wood, lake, river, or glen; for here that great, luxuriant and descriptive poet embodied his prolific visions of the "Faerie Queen," on the banks of his extolled and sequestered Mulla.

The gradual changes which are produced in the design and construction of houses in all countries must be dated from the commencement and progress of their public works To illustrate this assertion I shall quote Harris's History of Dublin, made in 1688, who says, "The castle which had for a long period of years been the residence of the chief governor, the parliament, and the courts of justice, was partly destroyed by fire in the same year, which took place on the 7th of April." But this accident occasioned great improvements in the city; better accommodations were made for the chief governor; the courts of justice were removed to those erected in Christ Church Lane. The tholsel was erected about this period. The architectnre of this building was in the style called King James' Gothic; yet, from the largeness of its component parts, it possessed a picturesque appearance, and was the first noble work in Dublin that was decorated with statues, having one of Charles II., and James Duke of York.[†] The Royal Hospital, at Kilmainham, was also building at this period. The design of this building was attributed to Inigo Jones, but upon what authority this conjecture is founded does not appear; and of the truth of this assertion there are strong doubts, inasmuch as Inigo Jones died on the 21st of July, 1651, thirty-two years before the commencement of the building. Whoever was the architect of this building it would be very desirable to have it recorded, for though it certainly possesses no superior merit to justify the superior hand of that great master to whom it is attributed, it evidently claims the originality of this having been one of the first specimens of regular architecture in the country. Essex and Arran Bridges have been recently built. These communications over the River Liffey are only noticed here as affording that convenience to the city which such works always contribute. From this period may be dated the epoch in which the city of Dublin has continued rapidly to advance in the improvements and taste for such buildings as give consequence, beauty, and magnificence to a city.

It must be acknowledged that public works of art from the leading features which must invariably attract the attention and notice of strangers, and must contribute to impress them with favourable ideas of the culture and progress of the fine arts; and whatever the inducement that may attract travellers to visit any country, we find an invariable record of the state and progress of its public works—these are often the only remaining monuments to point out to posterity its wealth and greatness.

There are many other considerations of no small importance to a state in erecting public works—the employment of a variety of professions, whose united efforts are required in their construction. The public wealth is diffused among the many; excitement is produced among individuals to embark in a variety of improvements, genius brought forward, which, without such encouragement and emulation, might be dormant; and the grandeur and taste of public buildings must always influence, more or less, those erected for the accommodation of persons of rank and taste. These are no small considerations. Among many other advantages attending the erecting of public works, independent of those, it is an acknowledged fact, that the great numbers who have been drawn by vagrant curiosity or study to visit Versailles, Chantilly, &c., have amply recompensed the expense incurred in erecting those celebrated places; and to the ruins of ancient Rome, the present city is indebted in a great measure for its support; even Greece has now scarcely any other inducement to invite travellers but to survey the remains of her magnificent public structures, and to trace the vestiges of her ruined cities.[*]

That public and national works should differ from those of private dwellings must be evident; the latter do not require that strict attention to the rules of art, yet the fancy which may range in their composition should be restrained by judgment, so as not to wander from the original principle which taste and culture have already established. Those acknowledged laws of improved art are surely models sufficient to restrain the practitioner of architecture from running into Gothicism and incoherence for the sake of novelty, too much the fashion of the present day.[†]

It appears (as related by Vitruvius) that the Grecians differed in some particulars in the manner of decorating the internal walls of their houses from the Romans, and admitted no subject but what were faithful representations of nature in stucco or painting; whereas the Romans frequently employed those fantastic ornaments which we call grotesque, and the French arabesque—of which many examples have been discovered at different periods in the neighbourhood of Rome, and were so much approved by Raphael and other great masters of his time, as to be imitated by them in a style no way inferior to the Romans; and notwithstanding this manner is censured by Vitruvius, 1, vii. c. 5, who says, "We now only paint on our walls extravagant monsters, instead of faithful objects." With all due deference to such a celebrated author, it has, in my opinion, many peculiar beauties, and sufficient merit to entitle its admission to contribute to the variety of decorations adopted much by the first restorers of architecture in Italy, either in their public or private works; their style was more massy and expressive combined with large historic pictures. For, as the architect frequently united the sculptor and painter in the same profession, whose aim appears to be to combine their different excellencies in the same composition, the ornaments of their walls and ceilings were composed of such mouldings and parts as to serve for frames for their productions in painting. This manner was followed by the architects in France and England; by Inigo Jones, who adopted the compartments in the ceiling for painting at old Somerset House. The ceiling at Whitehall is painted by Rubens, having a massy fretwork as frames enclosing the pictures. Le Pantre has published a number of beautiful designs in this style, but was at length compelled to give way to the bad taste which prevailed in the reign of Louis XV., when Massonier, Orpinor, and others introduced a strange compound of shields, which were executed in stucco, sometimes picked in with colour, varnished, gilt, &c. Very few of these decorations possessed any of the beauties of the ancient ornaments, yet this taste was for many years much admired in France and England, even after Kent had introduced many good specimens of the antique.

The painting of large historic pictures, &c., on ceilings and stairs was now declining, occasioned by the great expense and the want of excellence in the artists then employed; for at this period the arts in England were in a wretched state, particularly painting, and the circumstance that contributed to put this department out of fashion is rather singular. Kent, though a very indifferent painter, became not only a good but successful architect. Sir James Thornhill, the first historic painter of the English school at this period, had likewise begun to turn his thoughts to the same profession, and was employed to design and erect an extensive house at Moor Park, Herts, for a Mr. Styles. On Sir James making the usual charge of five per cent., that gentleman demurred paying it, which occasioned a lawsuit. The plea alleged by Mr. Styles was, that Sir James seldom attended the works during their execution. On the trial his merit was deemed the greater for being able to conduct the work without such frequent attendance.[*] The architects of that day were all greatly alarmed at this intrusion of the painters on their profession, and invited Actiere and other celebrated Italian stucco modellers in the French manner, which was but indifferently understood in England at this time. This style united cheapness to the charm of novelty; it became the prevailing taste, and thereby turned the painters out of doors, whom they (the architects) seem to be very cautious of admitting since.

---

[*] Among the painters, Hussey, Barrett, Barry, West, Carver, Hamilton, &c.; Hickey and Smith, sculptors; M'Ardell, Houston, Dixon, Gwynn, &c., engravers.

[†] Afterwards James II.

[*] There are very few monuments now remaining of Grecian or Roman magnificence but public buildings, temples, amphitheatres, and baths: these are the only works that possessed sufficient solidity to resist the effacing fingers of time, or to defy the violence of barbarians. The private but splendid edifices in which the citizens of Athens and Rome resided, have all perished. Few vestiges remain of the innumerable villas with which Italy was crowded, though in erecting and adorning them the Romans lavished the wealth of the world.

[†] How much these facts are exemplified may be seen in most of the improvements now in progress in various parts of the metropolis of London. Columns that were intended to support superstructures are inverted; the base to sustain the weight, is placed at the top; the diminished top is placed at the bottom; square bandboxes are united to columns, as at Warren Hotel, Waterloo-place, where all these incongruities are to be met with, and many others.

[In reprinting this paper we are actuated by the belief, that it cannot fail to prove interesting to our readers, emanating from the "pen" of such a man as James Gandon, although the author's success in *this* department is admittedly not equivalent with *that* in the "pencil," and some irrelevance, verboseness, and views not according with those generally entertained now-a-days, may be found therein.—Ed.]

MUSEUM OF IRISH INDUSTRY—DISTRIBUTION OF PRIZES.

The annual distribution of prizes to the students of this establishment took place on the 20th ult., in presence of the Lord Lieutenant and an elegant assemblage. Sir Robert Kane, the director of the institution, in the course of a lengthened and eloquent address, said that "the object for which the institution is founded is educational, and not merely the education directly of the number, necessarily limited, who receive instruction within its walls, but also that each individual here instructed may become in his own turn a centre of educational light and progress, so that the confines beyond which are the dark and dismal realms of ignorance, prejudice, and error, may yearly be further removed, and, under the guidance of enlightened statesmen, it and similar institutions may be made the instruments of advancing the intellectual position and the social prosperity of Ireland. Upon the whole a very satisfactory pregress had been made in the last session as compared with the session before the last. A distinction is drawn between the general and the special examinations; for, in the former the candidates are examined in all the fine branches of science taught in this institution; and in the latter only one branch of science is examined in. For the first place in the former the silver medal of the department is awarded; for the latter a bronze medal for each subject. Besides the medals, are awarded one or more money prizes of small amount, and a certificate of the prize having been obtained, as the examinations took place early in June, the money prizes were then paid."

The pupils to whom silver medals were awarded were presented by the director, and the professors severally presented to His Excellency the successful pupils in their respective departments.

The Lord Lieutenant, after some preliminary remarks, said—The products of nature, the materials of industry, the deductions of science, which form the special and exclusive subjects of attention and study within these walls, have nothing in common with the passions of the parties of the passing hour. We are here treading the serene temple of knowledge, which is pursued for its own bright sake with a homage which is perfectly disinterested. The rivalries of creeds and parties can find no admission here, and as for worldly honour and emoluments, the most lucrative rewards that we can offer to you are, the humble but honorable prizes and certificates which it has just been my privilege to deliver. It will further, I am sure, be looked upon as a most satisfactory incident in these proceedings, that as no distinction of class, or creed, or opinion, can find admission, so likewise there is no monopoly of sex. The laurels that are to be gathered here are twined around fair as well as around manly brows. Why should it be necessary to send to London for the medals which are to grace and adorn the possessors of Irish genius? Surely we ought not to allow it to be said, if you allow me to quote a line from the Roman poet—"Excudit alii Sperantia æra." Why should not Ireland cast her own medals as well as nurture her own successful prizemen?

Geyelin's Patent Bedsteads.—One of these bedsteads has been forwarded to us by the London agent, Mr. Kennedy, of Oxford-street, and—though it may not appear strictly within our province—we direct our reader's attention to the ingenuity of the invention. It combines the comfort of the spring mattress and the ordinary iron bedsteads—*duo juncta in uno*—and the lathing is formed of interlacing longitudinal and transverse hoop-iron strips, with powerful spiral springs between the upper and lower rows of the former, and between each flap of the hinges, connecting the latter with the frame and smaller springs. The centre is slightly elevated in curved form above the sides, which are also raised by the springs before described above the frame-work. They are easy of adjustment when the principle is understood, and are light but strong of construction.

EFFECTS OF RAILWAYS ON SOCIAL PROGRESS.

The *Building News*, in a memoir of the late Mr. R. Stephenson, remarks that—

"It is almost a stale theme to descant on the benefits of iron roads and steam horses; and yet, unless we do constrast the means of travelling before and after the Stephensons, we shall have but a very imperfect idea of the value of their labors. It is within the memory of men now living, when a journey between the northern and southern parts of this island was a perilous undertaking—necessitating the loss of many days, the expenditure of much money, and considerable personal annoyance. The 'north countrie' was as little known to Londoners at the beginning of the century as is Siberia now. Every man who spoke our English Doric, or had the Northumberland burr, was set down as a Scotchman, and trans-Tweed men had barely emerged from the condition of being regarded as foreigners. Mercantile communities excluded Scotchmen from their employment, and oftentimes included north countrymen under the same ban, while those dwelling beyond the Humber looked upon all the southerns as little better than cockneys, and not much superior to Frenchmen and continentals. The north countrymen who came to London acted as though they were dwelling among strangers.

"Such was the condition of England before Robert Stephenson's beneficent labors had borne fruit. What it is now we all know. The population is no longer stationary; it is eminently locomotive. Prices have gradually adjusted themselves almost to a level, and how important that is to capital and labour needs no political economist to expound to the least educated among us. The morning's *Times* may be on the luncheon-table or, at most, on the dinner-table of every household in this island on the day of publication. No incident can occur that is not chronicled in the London or local journals; local jealousies and feuds have disappeared, and pitched battles between rival towns are unheard of The productive powers and defensive forces of the empire have been augmented a hundred-fold by railways. And this happy change—this gigantic stride—has been mainly the result of Robert Stephenson's unceasing labours."

IMPROVEMENTS AT BRAY.

We understand that Mr. Dargan has laid out Bray strand as a promenade at his own expense, and applied to the town commissioners to fence it with chains and granite posts. As the borough funds were exhausted by other improvements and lighting the town with gas, the commissioners were reluctantly obliged to decline doing so at present, but unanimously offered to raise the amount by voluntary subscriptions. A committee was formed, and were proceeding to make collections, when they were met by Mr. Dargan with a request that the matter should be left in his hands, he thereby undertaking a further expenditure of £400. The commissioners unanimously passed a vote of thanks to Mr. Dargan for his liberality and generous offer.

VILLA SITES IN THE SUBURBS.

The lands of Kerrymount, Foxrock, and part of Galloping-green, south, lying between the Stillorgan and Carrickmines stations on the Dublin and Wicklow Railway, have been laid out in building lots, and will be disposed of by public auction in the course of this month by Messrs. Bentley, the proprietors. We took occasion to visit them recently, and find them in every respect desirable for the proposed purpose; combining the treble advantage of beautiful site, facility of approach, and building materials on the ground. The Railway Company has consented to a special station for this property—a concession highly commendable, considering tha very short distance intervening between the existing stations; and we learn that as soon as one dozen houses shall have been erected and tenanted, the enterprising proprietors will provide omnibus accommodation to and from Kingstown, for marketing purposes, &c. We hope to witness a busy scene in this locality shortly.

Wilme's Handbook for Mapping &c.—We learn from London that Mr. B. P. Wilme, C.E., M.R.I.A., is about bringing out a re-issue of his important and eagerly sought for work entitled "Wilme's Handbook for Mapping, Engineering, and Architectural Drawing." Early application should be made for copies (the number of which is limited) to the publisher, Mr. Weale, of 59, High Holborn.

[*] *Vid.* Walpole's Anecdotes of the Reigns of George I. and II.

THE WATER SUPPLY OF DUBLIN.*

IN our last article on this subject we said we should "analyze the plans of the corporation engineers, and see from what sources they sprung." We shall now do so, and our readers will be able then to judge whether we were justified in also saying that plagiarism has been practised to an unprecedented extent, and the labours of others availed of by the consulting engineer of the corporation, without the slightest acknowledgment to those from whom he borrowed his suggestions.

It will, no doubt, be recollected that when the water supply of Dublin was agitated in 1854, the Sanitary Association devoted a considerable portion of time to its investigation, and followed, perhaps, the wisest course that could have been taken to arrive at truth—namely, to examine, as witnesses, every person in Dublin of known knowledge on the subject. The whole evidence was published in the *Sanitary Journal*, and with it an elaborate report of the association, signed by its chairman, Sir Edward Borough, Bart., which report, it appears, was officially presented to the corporation, together with diagramic plans and sections of the proposition, designed by the honorary engineer, Mr. Jasper Rogers, C.E., by whom that report, &c., had been prepared on behalf of the association; and the report of the corporation committee states that these were all placed before Mr. Hawksley, together with the plans submitted by others.

It will scarcely be forgotten also that what produced the necessity for this report from the Sanitary Association, was the plan presented to the corporation by their engineer, Mr. Neville, proposing that the supply from the canals should be abandoned; the whole to be obtained by means of catchment basins in the Dublin mountains — a proposition, in fact, originating with Mr. Robert Mallet; and we are strongly of opinion that if the association had not acted so judiciously as they did, the ratepayers of Dublin would *be now paying* their contribution towards a scheme which was subsequently negatived by the engineer to whom the question was submitted, and who adopted in its place the almost identical plan suggested by the Sanitary Association—*vide* extracts from its report, as follow :—

"THE SANITARY ASSOCIATION.

"Royal Dublin Society House,
12th September, 1854.

"Committee appointed to report upon the water-supply of Dublin as regards its best source, its sufficiency, its purity, its economy.

"Sir Edward Borough, Bart., *Chairman;* Sir Henry Jervis, Bart., James Haughton, Esq., Robert Molloy, Esq., Doctor Ryan, Jasper Rogers, Esq., C.E., *Honorary Engineer;* Doctor Mason, *Hon. Secretary*.

"REPORT.

"In accordance with the desire of the Association, your Committee has given their best attention to the subject submitted to their investigation, believing it to be one of paramount importance to the citizens of Dublin, and being satisfied that, next to effective drainage, an ample supply of pure water is the most essential requirement for the preservation of health in all cities. . . . . .

"Your committee submit the evidence given *in extenso*, believing that it will be read with interest. And they would beg to draw attention to the letters of Messrs. Louch and Mulvany, civil engineers, and of the Secretary to the Grand Canal; but they have to express their regret that the borough engineer did not permit them to have the benefit of his evidencc, he having been especially invited to attend the meetings along with the other parties interested in the water supply of Dublin. . . . . . .

"The proposed supply from the River Dodder, to be aided by catchments, has occupied your committee's best attention. It will be seen by the evidence, amongst other facts:—

"That the River Dodder is frequently almost dry during the months of June, Jnly, August, September, and October.

"That the fall of rain proposed to be collected by the catchments cannot be depended upon as being sufficient for the supply of Dublin. . . . . . .

"That the table given in the borough engineer's report shows the *fall of rain in Dublin for the year*, but there is no table to show the monthly fall.

. . . . . . "That almost the whole catchment basin for the proposed reservoir consists of a bed of peat, of a slightly fibrous and earthly texture, from four to eight feet in depth. . . . .

"That bog water is unfit for household use; and your committee believe that no extent of filtration at present known would divest such water of the several properties, injurious to the animal system, which it contains. . . . . . .

"They, therefore, have no hesitation in expressing their conviction that the River Dodder and the propased catchments should not be made the source of supply to the city of Dublin, especially as they believe that a never-failling supply of pure and wholesome water, principally derivable from springs, may be procured at an infinitely less expense. . . . . . .

"Your committee feeling satisfied, from the proofs enumerated, that there is to be found in the Grand and Royal Canals a supply of water amply sufficient for all the requirements of the city and suburbs of Dublin, now and for the future, conceive it to be their duty to submit certain views on the questions which have presented themselves, arising out of the evidence offered and otherwise.

"It appears to your committee that to take the supply from either canal *solely* would be liable to objection, from the necessity, in such event, for the descent of the water into the valley of the Liffey, and its ascent at the opposite side; they would, therefore, recommend that the supply be taken from both canals. . . . .

"That for the supply of the south side of Dublin, the Grand Canal should be made available, taking the water from the point laid down in Mr. Mulvany's proposition for the whole supply of Dublin *(the 11th Lock)*.

"That for the north side it should be taken from the Royal Canal, at or near *Blanchardstown*, the position selected by Mr. Louch for the supply of the reservoir proposed by him, also for the total supply.

"At each of these points, your committee suggest that a moderate sized *purifying basin*, of an extent sufficient to be made use of hereafter as a *filtering chamber* (if found necessary), should be excavated immediately adjoining the canal alongside of it, formed in the same way, and about the same breadth and depth, the junction with the canal being at the further end from Dublin—the opening being about fifty feet in length.

"Your committee suggest, that at the point of junction, and for one hundred feet at each side, a perpendicular, or slightly battered, wall should be constructed within the breadth of the embankment of the canal, and that the recess thus formed be excavated to a level with the lowest point of the bottom of the canal, while the grating, or opening, through which the water would enter the purifying basin, should be not more than one foot in depth from the average water surface line. The result of this arrangement your committee conceive would be that a deposit of all siliceous and clayey substances would take place outside the purifying basin in the dead water caused by the recess within the embankment, and whenever necessary that deposit might be readily removed. Thus, the purifying basin could be kept free from such description of impurities.

"Your committee propose, that from the purifying basins mains of sufficient dimensions should be laid *direct* along the line of the canal to the present reservoir of the city, connecting those mains with a "*regulating chamber*," formed of strong metal plates, and fixed about the centre of the reservoir, and from which chamber the high-pressure mains should issue. The chamber should be so constructed as to permit the water to flow into the present reservoir, which should be at all times kept full in order to supply the low-pressure mains. Thus, the high-pressure service would be effected from *the chamber*, and the low-pressure from *the reservoir.* The *chamber* should be placed in such position in or about the centre of the reservoir, that discharge of water from the ventilators might take place without inconvenience.

"Your committee believe that such an arrangement would enable the city of Dublin and suburbs to be supplied with a high-pressure service of water, sufficient to supersede the use of fire engines, by separate mains of moderate bore being used for that purpose, and for those parties who might require a high-pressure supply at an increased rate; whilst a low-pressure supply of pure water would be secured to those who prefer it through the existing mains. . . . .

"It will be seen by the proposition suggested,

"That the whole *cost* of the great reservoirs proposed, and the watercourses, &c., to them from the canals, would be saved.

"And that the *expenditure* would be only the cost of the supply

---

* See page 125 *ante*, and previous numbers.

> mains, the regulating chambers, and the purifying basins, the two latter being comparatively trifling. . . . . .
>
> "As regards the final purification of the water to be taken from the sources recommended, your committee believe there need not be any apprehension. It is well known, that the effective filtration of large quantities of foul water has been long considered to be an operation of great difficulty, but the analyses of the canal waters show that they are comparatively pure. Pending, therefore, any necessity for filtration which might arise hereafter, your committee would suggest that *the purifying basins* proposed at the side of the canals at Blanchardstown and the 11th Lock, should be well stocked with fish usually found in the canals.
>
> "Experience has amply proved that animalculæ, and all animal impurities in suspension in water, are greedily devoured by fish; and observation has shown that in every instance where fish is abundant, water is pure. The proposition is unattended with expense, and your committee suggest it pending any arrangement for regular filtration which possibly might be found necessary, and *which may be accomplished, if required, within the space proposed to be contained in the purifying basins.*—(Signed) EDWARD BOROUGH, BART., *Chairman Sanitary Association.*"

This is the report of the Sanitary Association, acting under the able guidance of Sir Edward Borough, Bart., made in September, 1854, in opposition to the proposed plan of the corporation engineer, then upon the eve of adoption.

Let us now see what the corporation engineer reports in November, 1858, having, in 1854, repudiated the water of the canals:—

> "REPORT OF THE CITY ENGINEER ON THE PROPOSED WATER WORKS.
>
> "GENTLEMEN—I have carefully read over the report that you have received from your consulting engineer, Mr. Hawksley, on the subject of the improvement of the supply of water to the City of Dublin.
>
> "I find that the result that he has arrived at, after the examination of the different plans submitted to you for the improvement of the water supply, is as follows:—
>
> . . . . . "That the best and most economical plan for you to adopt is, to continue to derive the supply of water for the use of the city from *both* canals, ... provided they will undertake to give a guaranteed and preferential supply of not less than ten million gallons of water per diem, at a fixed rent, in perpetuity, of £2,500 per annum.
>
> . . . . . "That the water be taken from the Grand Canal Company, from the pond or level at the head of *the 11th Lock*, near Clondalkin; and that on the land adjoining this a service reservoir, filter-beds, and pure water tank should be constructed, from which the water should be conveyed to join the present mains, distributing the water through the city by a 36-inch main; and that the water should be taken from the Royal Canal at the eastern end of the pond or level above the 12th Lock, *at Blanchardstown*; and that a service reservoir, filter-beds, and pure water tank should be constructed on the adjacent lands, from which the water is to be conveyed, to join the city mains, by a 30-inch main. . . . .
>
> "From the experience I have had in connection with your works, now for ten years, I believe that neither canal can of itself, under existing circumstances, give you the quantity of water you require, therefore, that you must deal with both.
>
> "With regard to the quality of the water for domestic use, although it is not as soft as that which could be got from the granite districts of the Dublin and Wicklow Mountains, and consequently not so good for brewing, washing, and culinary purposes, yet it is a good water, colourless, and not above the average hardness of the water supplied to London and many other large cities and towns: and when taken at the distance from the city proposed, and properly filtered, will be of a very superior quality to what it is at present, delivered from the city basins.
>
> "Under all the circumstances of the case, and after giving the subject my best consideration, I feel bound to state, that I believe that if the canal companies agree to give the water, as mentioned, for the sum of £2,500 per annum, that it will be best for the Corporation to carry out the plans *of their consulting engineer, (?) and adopt the canals as the source for the improved water supply to the city.*"

Thus we find that after four years of consultation, investigation, reports, and surveys—at a cost of some £500—the borough engineer, the consulting engineer, and the corporation actually adopt the identical plan of the Sanitary Association. And the borough engineer, to his credit be it named, candidly admits that, "AFTER GIVING THE SUBJECT HIS BEST CONSIDERATION, HE FEELS BOUND TO STATE THAT HE BELIEVES, IF THE CANAL COMPANIES AGREE TO GIVE THE WATER, THAT IT WILL BE BEST FOR THE CORPORATION TO ADOPT THE CANALS AS THE SOURCE FOR THE IMPROVED WATER SUPPLY TO THE CITY."

But do any of the parties admit *the source* from whence they took the so-called "*plans of their consulting engineer!*"—Do they name the Sanitary Association or their engineer, Mr. Jasper Rogers, in any manner whatever, whilst their "consulting engineer!" actually uses almost the words of the association report as his own, in bringing forward his proposition (and we have reason to believe he was directly supplied with that report and evidence by Mr. Rogers)—Do any of the parties acknowledge, in any manner, from whom the proposition sprung? No, not one! On the contrary, Mr. Hawksley, in his report, totally ignores the association proposition, whilst he adopts it nearly verbatim; and in order apparently to cover the—we had nearly said theft—he concludes his report with the following passage:—

> "But I do not think I should be acting with justice to the gentlemen by whom they were originated if I did not recall to your recollection that Mr. Louch, Mr. Hassard, Mr. Neville, and Mr. Mulvany, have each separately proposed that the future supply should be obtained in an improved manner from one or other of the canals. . . . . . Mr. Hassard has also suggested as an alternative scheme the employment of the beautiful waters of the River Vartry and other adjacent districts, but at a cost which that gentleman admits to have placed these (otherwise the best sources) beyond the reach of the community. Mr. Brazill has proposed the River Liffey, near Poulaphuca Bridge, as an available source; and Mr. Mallet, who projected a scheme on the Dodder for the use of the millowners, concurs in the appropriation of the canals."

The Sanitary Association proposition is thus entirely cushioned. Why? it may be asked. Was it that Mr. Hawksley might take to himself the credit, and set it before the world as his own?

Another question, also naturally arises, was the committee of the corporation ashamed of the plagiarism, and anxious to get out of its adoption?

Naturally, as gentlemen, they would be—and it appears very like it; for after a lengthened correspondence with the canal directors, couched in terms that almost invite a rejection of the propositions made under Mr. Hawksley's report, and proposed in such stringent terms that no body of men directing the affairs of a company could properly bind themselves to, the negotiation was abruptly ended as regards the supply from the *two* canals. The city engineer was then called upon to consider a plan for supplying the city with water from the proposed catchment basins, aided by the water of *the Grand Canal* only, at a rent of £1,800 per annum; which by that company's letter of the 5th November, 1858, they stated was the lowest sum they would take for a "preferential and guaranteed supply of six million gallons daily," *being £300 a-year increased rent!* In pursuance of this order, Mr. Neville submitted the plan which has now been approved of and adopted by the corporation.

We think it is tolerably evident, then, that there was, in reality, an objection on the part of the corporation to adopt the plan of the Sanitary Association, which, although attempted to be brought out as Mr. Hawksley's, could not fail to be known as that of a so-called "rival body." But although we think there was apparently a good deal of such feeling in the matter, it is to be regretted, as regards the interests of the citizens; for no matter whether plagiarised by Mr. Hawksley or not, there can scarcely be a doubt that it is the most economical and most desirable proposition which has been made. The Sanitary Association did not propose it until they had taken the best evidence that could be had on the subject; and after four years' subsequent consideration, Mr. Hawksley and Mr. Neville report, in the strongest terms, in its favour. But we shall return to the subject, and show facts which will, perhaps, satisfy all parties that it *is* the best plan which can be adopted, and the most economical.

Since the foregoing was in type we have had the pleasure of reading the very unexpected report from Dr. Gray and Mr. Codd, recommending the abandonment of the third and last plan unanimously adopted by the corporation. It is a most wise step; and although the third time may not really be the charm, the citizens owe much indeed to Dr. Gray, to whom Mr. Codd, very modestly and very justly, gives almost all the credit for a truly clever and elaborate examination into existing facts. No one can doubt that a source for the purest water has been selected, and in a very judicious situation. The canal companies have apparently made *a good case against themselves*, by what would appear to be over caution, and there could scarcely be a more fortunate loophole for letting a body of corporators out through.

The negativing of the Kippure plan is also most wise. We have already said no one could tell what its cost would be, and we only wonder that any one who ever walked over the land proposed for the basins, could have imagined the capability; it might be as well expected to hold water in a kitchen cullender.

But notwithstanding the over caution of the canal directors, we still believe, even if there be not sufficient water now, which we doubt, the lowering of the summit levels even 6 *inches* would give it more than amply. It would be well to contrast that cost with the compensation to the mill-owners, and actually arrive at what that is to be, before the proposed measure be undertaken.

Heartily congratulating our fellow-citizens on the retreat from the long-fought battle of the catchment basins and bog-water, which appears to have been accomplished by an able *coup d'etat*, we shall continue the subject, and perhaps be able to show that Mr. Whelan is not far wrong as to the capabilities of the canals, although he stood alone in opposition to the present plan as he did to the former.

MR. POLLOK'S FARM STEADINGS, RESIDENCE AND OTHER WORKS, CO. GALWAY.

THE monster steadings erected by Mr. Pollok on his estates in the County Galway, have acquired a world-famed celebrity for that gentleman; and the following is a general description of one of the *fourteen* completely finished since July, 1856, when the first stone was laid. The main building covers an area of 3320 square yards roofed in; the barn, straw house, and steaming house are at end, measuring 176 feet by 24 feet in the clear, with two ranges of granaries, sheaf barn, and straw houses above. The sheaf barn is 64 feet by 24 feet, and is supplied with a threshing machine, driven by a water wheel, which also works a bone mill in another part of the building. a pair of millstones, a straw cutter, oil cake bruiser, a pair of fanners in each granary, and a force pump, supplying a cistern 38 feet above ground level, and containing 2,400 gallons.

At right angles to barn, and nearly in its centre, it is bisected by a transept 199 feet long by 24 feet wide and 22 feet high. The roof and side walls of second floor of transept are supported by metal pillars and trussed girders. The ground floor of transept is a through passage, and turnip and root store for feeding purposes. Twelve feet high above the passage is a loft the whole length of transept, and 24 feet wide, part being a hay-loft, and the remainder stores for cut hay, bran, oats, oilcake, grass seeds, &c.

The four angles included in barn and transept are each enclosed and roofed, and subdivided for cattle, &c. The respective sizes of each angle are as follows:—95 feet by 72 feet, and 64 feet by 58 feet on one side of barn; and 64 feet by 72 feet, and 64 feet by 58 feet on the other, each 12 feet high from floor to under side of tie-beam. Two adjacent angles on right and left of barn and east side of transept—viz., 95 by 72 feet and 64 by 72 feet—are each arranged for 232 tied-up feeding cattle, and have stalls, feeding passages, and fire clay feeding troughs. The other two angles right and left of barn, and on the west side of transept—viz., 95 by 58 feet on the one side, and 64 by 58 feet on the other—are subdivided as follows: in the large angle is the stable, for 19 horses in stalls, and 16 in loose boxes, also 6 loose boxes for bullocks, each box to hold two. In one of the angles of this square is the steward's or caretaker's lodge, containing kitchen, parlour, and closet on ground floor, and two bedrooms above; and which, though contained within the square, is completely disconnected from the interior by a high wall with a small window for surveillance.

The other side or square—viz , 64 by 58 feet—is subdivided into 8 loose boxes, for two cattle in each, a large bone store, with bone mill, blacksmith's forge, and carpenter's workshop. The whole is principally lighted from the roof, although side lights are used where they could be put in with propriety. On the roofs and sides of transepts are 52 louvre board ventilators, ensuring free current of fresh air through the whole establishment. Owing to the extra height of the walls (12 feet), and roof and space above the cattle, there is no extra current of cold air in any particular part of the whole house, when fully filled with cattle and horses (which it has been during the last two seasons, and is now filled the third time) there is always a uniformity of temperature through the whole.

There are 1,740 superficial square yards of timber flooring and 4,200 yards of slating. The roofs on this and all the other buildings on Mr. Pollok's estate are all sheeted with ⅝ sheeting, nailed on to horizontal purlins, which gives the inside a neat, clean, and comfortable appearance, and also keeps the houses cooler and a uniform ventilation—every joint of the sheeting and every joint of the slating being a ventilator on a small scale. The whole roofing is supported with 36 metal pillars, 12 feet high, each pillar answering the double purpose of pillar and down pipe for roof water. Connected with said pillars are 390 feet of cast-iron gutters, which answer both for gutters and roof girders; also 920 feet of eave gutters, 350 feet of lead valley, and 240 feet of down pipe; 65 roof lights, 55 side lights, and 20 outside doors. The whole steading is lighted up with Messrs. Edmundson and Co.'s (Capel-street) hydro-carbon gas in upwards of 50 bat-wing jets, in glass lanterns; all in suitable places through the whole building, presenting an imposing scene when all is lighted up, and upwards of 300 cattle contentedly but busily eating up their last meal for the night, with all the light and shade of roof and pillars and the various colours of the cattle.

The main building is walled all round and enclosed by an open shed inside, 1,100 feet long by 14 feet wide, and between main building and surrounding shed there is an area of 24 feet wide on three sides, and 70 feet wide on the fourth side, in which there are two large dung-pits and liquid-tank. There is only one main entrance into yard and main building, and one from stack-yard into second storey of barn, which is on a level with stack-yard. All the large stack-yard is fitted up with iron stack-stands, arranged for iron tramways from stacks into barn. One half of the surrounding sheds are divided into 10 loose boxes for 2 bullocks each box, and 3 loose boxes for bulls, and pens for 140 store cattle; one half of the remaining half are cart-sheds, harness and tool room, pay-office, and weighing-office; and the remaining half of this subdivision consists of guano-store, poultry-house, implement-store, watercloset, and glass retort-house. The whole extent of ground floorage of surrounding shed is 1,711 superficial square yards. The total ground taken up with all buildings is 8,450 superficial square yards; the total of all the roofs is 7,555 superficial square yards; total of all ground floors, 5,050 superficial square yards, and 1,750 square yards of timber floors. The total cubical contents of all buildings is 756,224 cubic feet—the actual cost of the whole being under 2d. per cubic foot. Five fire plugs are placed throughout, and two hoses are provided in the event of accident.

In addition to the above works, a large dwelling-house, in the Elizabethan style, has been erected for the proprietor; also 8 farm-houses, a large flour and oatmeal mill, with store and house for miller, 2 carpenter's shops and blacksmiths' forges, 2 saw-mills, 7 steam thrashing-mills, 4 limekilns, 40 stewards', tradesmen's, and labourers' cottages—comprising upwards of 40 miles of stone walls. The plans and specifications were made, and the work superintended by Mr. William Maxwell, of Ballinasloe, by whom the above particulars have been communicated.

The goodness of illuminating gas is diminished by its being kept and that of coal gas more rapidly than that of oil gas.

THE NEW BUILDING—KILDARE-STREET CLUB.

For several months past the new "house" for this club has been in course of construction at the intersection of Kildare and Leinster Streets; and being already built to about the level of first floor, commences to display some of its architectural characteristics.

The style adopted by the architects, Messrs. Deane and Woodward, is Byzantine, which admits of many bold and ornamental features being adopted in the detailed portions, and picturesqueness of effect secured in the general contour—a style which, we must remark *en passant*, is coming rapidly into public appreciation, and seems destined to work a most desirable revolution in our "street architecture" especially. This building will present towards Kildare-street a frontage of 184 feet, by 63 feet towards Leinster-street; and carried up to a height of three storeys, exclusive of basement, will attain a considerably additional elevation above the surrounding houses. On the exterior a variety of colour is obtained by the application of different materials for the walling, the dressings and ornamental work. For the former, red brick is employed; and for the latter, Portland and native limestones. One of the most prominent features for the public gaze will be a projecting oriel, carried up two storeys, in Leinster-street, with elaborate dressings thereon; and we may also add that a handsome arcaded portico, with disengaged shafts of polished marble, and forming the main entrance, will contribute a pleasing object in Kildare-street. The windows of each storey will present a variety of design, and be relieved with ornamental stone dressings. Horizontal string and belting courses are introduced at intervals, and the whole building is to be capped with an elaborately enriched projecting main cornice. The carvings of this latter, and the caps of the columnar shafts, will admit of much taste and variety being displayed in the execution; but we understand that the professional firm supervising the work very liberally allows competent workmen a consistent latitude in producing forms—a fact highly creditable and worthy of general adoption. Interiorly the arrangements of the ground floor—which though technically termed so, is elevated above the pathway level—comprise an outer and inner hall, communicating with a grand stone staircase, arcaded on two storeys, and presenting many noteworthy features; a coffee and morning room, each 60 feet by 30 feet; bar, serving-room, clerks'-room, &c., &c. On the first floor are the library, 60 feet by 30 feet; the card-room, 30 feet by 20 feet; the writing-room, 39 feet by 30 feet; and spare-room, 30 feet by 25 feet. On the floor above will be numerous bed-rooms, &c., for the members. At the rere of the building a racquet-court, private dining and smoking rooms, are provided; and in the basement storey are comprehensive culinary arrangements, stores, servants' accommodation, &c. The contractors for the work are Messrs. Cockburn and Son, and the expenditure will be about £21,000.

INCREASING VALUE OF PROPERTY IN BELFAST.

An extensive district was recently sold in the town of Belfast for a sum that indicates the present value of property in that town, whose rapid increase in extent, population, and mercantile enterprize exceed by far that of any other town in Ireland.

It lies between the Old Lodge Road and Peter's Hill, and covers about five acres of ground, with several new streets laid out through it—amongst others, Israel-street, Upper Townsend-street, &c. There are 68 dwelling-houses thereon, which pay a gross rental of £311 18s. 1d., and £53 19s. of ground-rents, making a total income of £365 17s. 1d. After deducting a head-rent of £11 1s. 7d. and a sum sufficient to cover the taxes payable by the landlord, there would remain a nett rental of about £260 per annum. In addition to this, there are about 2,500 feet of building ground, the worst of which can be readily let for 2s. per foot, and some of it will be worth double that sum. The site is high, and offers facilities for drainage, and there is no doubt of its being very soon let for building. For this valuable property, offered at first in seven lots, there were no bidders, and on the whole being offered in one lot, only two bidders appeared After three or four bids the property was knocked down to John Savage, Esq., T.C., at the sum of £5,600. The unsuccessful competitor was David M'Connell, Esq.

THE NEW ROYAL BANK, FOSTER-PLACE.

As the building operations for the Royal Banking Company progress towards completion, we are enabled to give reliable particulars of the works actually executed. The new bank immediately adjoins the old—each being on each side of the existing entrance doorway—and the cash department will occupy an extent of 80 feet from front to rere, by about 54 feet in width. The approach to cash-office will be through a pair of double doors and mahogany timber porches, to a vestibule—intended as a portion thereof—occupying the full width of the building, and about 22 feet in height, formed by columns supporting the divisional walls above, and terminated with a richly stiled, pannelled, and coffered horizontal ceiling. Thence commences the main portion of the new building, which is triple roofed, the central span being 26 feet in with, with semicircular ribs springing from metal columns, and having elaborately enriched pannelling, spandrelling, central and side lights, corresponding with curve, introduced; and the side compartments or aisles, about 13 feet each, are roofed in quadrant form, the ribs abutting respectively against main walls and girders of central roof, and decorated in character with the other portions. The columns on which the girders rest will be finished with Composite caps and bases, and portions of the shafts ornamented likewise; but their absence altogether—which was quite *practicable*, except where main walls exist in front building—would have materially conduced to the general effect.

The counters and stalls when added will radiate semicircularly, and on same floor is a strong room, 18 feet 6 inches by 10 feet 6 inches (carried up a short distance, affecting the general contour, but possibly impracticable elsewhere), manager's-office, &c., &c.; and slightly elevated above this level, and ascended by a wide flight of steps, are the runners' and other offices—communicating by a separate entrance with Anglesea-street—stairs to basement and floors above, &c., &c. On first floor spacious apartments are at command, but their general purpose are, as we understand, undefined as yet, and accommodation is provided for a resident clerk likewise. The basement is entirely fireproof (all buildings of this class might in prudence be completely so), and contains stores, porters'-rooms, warming apparatus, &c.

The work may be regarded as creditable to all concerned, and seems to be executed in first-class style. Mr. Charles Geoghegan, architect; Mr. William Crowe, builder; Mr. Doyle, superintendent. Messrs. Courtney and Stephens supply the iron work.

COMPETITION MATTERS—THE ULSTER HALL.

Thirty-eight professionals have entered the lists to compete for the office of architect to the Ulster Hall Company. It is said that the designs sent in will be publicly exhibited, and it has been suggested that they be numbered, and a book provided, in which each visitor may state his opinion relative to their merits or otherwise. We would add that, for various reasons, such opinion should be accompanied with name and address. The dimensions of the proposed hall are so limited that accommodation is only to be provided for 2,000 persons—viz., 1,500 on the ground floor and 500 in galleries. We anticipated a building capable of accommodating, at least, double this number. May-street Church, in same town—and an important structure of its character—is seated for 1,600 persons, and we have no doubt but that on many occasions 2,500 persons have been inside its walls at one time. Experience has shown that it is greatly too small to accommodate the numbers which might profitably be brought together in Belfast of the present day, which has hitherto doubled its population every twenty-four years, and will, no doubt, continue to do so in future. Taking all these circumstances into consideration, the erection of a building to accommodate 2,000 sitters appears to be a mistake, and will not remove the want now felt in Belfast of a structure capable of containing large assemblies. It will be a matter for regret if the directors of the Ulster Hall Company adhere to the dimensions in the instructions to competitors; we entreat them to consider the desirability of erecting a building on a larger scale, and commensurate with the wants, not only of Belfast, but of the province after which the proposed building has been named.

DEATH OF MR. ROBERT STEPHENSON, C.E.

Strange coincidence that the same space that was devoted in the last No. of our journal, "one little month ago," to chronicle the death of Mr. Brunel, the eminent engineer and designer of the Great Eastern, is occupied in our current publication to announce, that *he* who so recently, full of life, hope, and professional fame, followed the remains of his friend and brother professor to the tomb, has himself returned to the bosom of "MOTHER EARTH." And stranger still, that *each* should be called on the eve of the two grandest projects of the age—their own conceptions—being accomplished—viz., the Great Eastern, and the Victoria Bridge, Montreal, on the Grand Trunk Railway of Canada; both, too, if not of somewhat similar character, at least having an affinity of purpose. All honour to the noble deceased, noble in intellect and genius—nature's true nobility—has been gratefully paid him by his countrymen; perhaps with less pomp than might have been anticipated, but with all the sincerity of regret that England invariably feels for the loss of her great men.

Mr. Robert Stephenson's history, as well as the antecedents of his father, "George"—the first adapter of steam to railways—is familiarly known already, and needs no repetition, at least in a scrap biography; but as the father died, so has the *son*—"the noble scion of a noble house"—leaving names immortal, and stupendous monuments to register their fame to posterity.

METROPOLITAN IMPROVEMENTS.

Messrs. Ferguson and Co. are newly fitting up the premises, 105, Grafton-street (to which they are removing, from No. 108, owing to increasing business), under the direction of Mr. Lyons, architect; Mr. Meighan, builder; and Mr. Manning is about having a handsome front in the Flemish style—and corresponding with that of Mr. Higginbotham's establishment adjoining—together with internal alterations made to the last-named premises, from designs by Mr. Louch, architect. The Verdon hotel in Talbot-street is being newly fronted in cement, with Corinthian pilasters, entablature, parapets, &c., after drawings by Mr. Gribbon, architect, and doubtless will present a tasteful exterior; but it appears a matter of regret for the architectural contour of this important and rapidly progressing thoroughfare, that the proprietor did not deem it desirable to produce parallel with street, the front wall now receding angularly. The building up of the waste space immediately opposite, will also be a consummation devoutly to be wished for. Messrs. Marsh and Co., of Lower Sackville-street, are engaged in building operations of an important character, under the direction of Mr. M'Curdy, architect. Dr. Wilde is having an addition, containing a conservatory and other apartments internally, and presenting an architectural exterior, constructed at the flank of his house in Merrion-square—corner of Lower Merrion-street—according to designs, &c., by Messrs. Isaac and W. Farrell, architects; Mr. Meighan, builder.

AN ARCHITECT'S THOUGHTS IN BELFAST.

So much interest has been manifested by the Dublin Builder in architectural matters in this town, that I am encouraged to assume that the following crude thoughts may prove acceptable:—

We hear much talk about the industrial and the mining resources of Ireland, and we admit that a little has been done to develop those resources; but, unquestionably, much still remains undone. One of the prominent wants of Belfast is good building stone. This, we have no doubt, could be found in its vicinity if a sufficient depth were attained in some of the many sandstone quarries with which it is surrounded. The brick and plaster porticoes which ornament (?) many of the public buildings of Belfast and its neighbourhood, are anything but creditable to architectural taste, and should be altogether omitted if the funds will not admit of their being executed creditably in cut stone. As this part of the structure is designed solely for effect, and to afford pleasure to the mind of the beholder, they have very little either of taste or discrimination who expect that brick and plaster columns or porticoes will ever do so. It is to be hoped that a better architectural taste is spreading in the minds of the community, the effect of which will lead to increased efforts on the parts of committees and others to secure the services of efficient men.—[Communicated.]

ASSISTANCE TO INVENTORS—A NEW PROJECT.

So frequently have instances come under our notice—one very recently—of ingenious inventors being barred from giving to the world the benefit of their ability, and reaping for themselves pecuniary advantage, owing to lack of the *sine qua non* to bear them through the routine of Chancery-lane requirements—that we hail with pleasure the advent of a company, projected to take the poor man by the hand, and place his invention on an equally advantageous footing with that of the capitalist. Such, at least, is the avowed purpose of the Inventors' Assistance Company—whose prospectus appears in another portion of this journal—and we see no reason for anticipating anything either impracticable or mythical in the project, but doubt not it will achieve great things, if the primary details of management be carefully arranged and systematically carried out; to our minds the secret of success in all companies with *bona fide* intentions.

USE OF MACHINERY—PRECAUTIONS AGAINST ACCIDENTS.

Science progresses by experiment; and experiment must, to an extent, be attended with risk in testing probable consequences; but the greater the progress for the *general* weal, the greater the probability of *individual* sacrifice, yet

"All partial evil is universal good!"

Results have invariably proved this in every department of knowledge, and daily do further proofs present themselves. Mechanical labour gradually supersedes manual, and being as yet only in its infancy, it must ultimately eclipse it *in toto*. Engineers construct machinery to put time, the elements, and human labour at defiance; but "mercantile advancement" takes the lead of consideration for "human life," the latter being purely of secondary importance. *Such should not be!* The life taken by *design* is capitally punished; that lost by want of *foresight* and proper provision for its protection, is denominated a "mere accident." *Machinists, look to this!* exert your inventive faculties to place the requisite guards on your machinery, that incaution may not lead to *fatal* accident, such as occurred recently in this city and very frequently elsewhere. We live but "for the hour;" but we should live for our fellows as ourselves!

MEDIÆVAL MANUFACTURES IN ENGLAND.

The establishments of some firms in England—metropolitan and provincial—eminent in the manufacture of mediæval iron and brass work are worthy of a special visit, and present in themselves pleasing and instructive exhibitions. Some very beautiful illustrated catalogues containing varieties of designs for monumental brasses, coronæ, standards, lecterns, hinges, &c., &c., have been produced at considerable expense, and would form an acquisition to the library of every artist. Amongst the principal in this peculiar branch are Messrs. Hart and Son, of Wych-street and Cockspur-street, and Messrs. Johnston, brothers, of 190, High Holborn (both of whose manufactories we had a recent opportunity of personally inspecting), also Messrs. De Baufer and Co., of Old Fish-street, St. Paul's, London; and Messrs. Thomas Brawn; and Hardman and Co., of Birmingham, the latter firm being extensively engaged in fitting up ecclesiastical edifices in Ireland.

MR. SCOTT RUSSELL AND THE DIRECTORS OF THE GREAT EASTERN.

The arbitrators selected to arrange the matters in dispute are Mr. Fowler, C.E., on behalf of the former; Mr. J. R. Maclean for the latter, with Mr. Hawksley, C.E., as umpire. It is a matter for regret that differences have arisen to disturb the harmony that *should* exist between all concerned in such a project. We hope for a satisfactory adjustment.

Archæological Discovery.—A discovery has been made near Begerac, which tends to upset existing theories as to the signs of distinct periods of Celtic civilization. Some workman came upon a tomb, which contained, besides the bones of a man, a clumsy collar, composed of twelve round yellow wires rolled spirally, a bronze hatchet, a bronze sword, and a fragment of an earthenware vase. M. Labat, Curator of the Museum of Arms at Bordeaux, and the Viscount de Goargues, correspondent of the Bordeaux Academy, have arrived at the conclusion that the Celts were acquainted with the use of metals, at the same time that they employed flint hatchets, and that bronze and flint hatchets do not represent two different periods of civilization, but two contemporaneous trades.

HORSE RAILWAYS.

Some months ago we advocated the use of horse railways for Dublin and its vicinity, but owing to some opposition the Irish Tramway Bill met the fate of the "innocents" in committee. We have taken some pains to arrive at the working of the lines in New York, Brooklyn, Boston, and Philadelphia, which we subjoin for the information of our readers. In New York the lines were laid in 1852, meeting with great opposition from proprietors of houses and lands, shopkeepers, and residents along the lines, but now they are as popular as unpopular at first. The Philadelphia lines were opened in 1858; the citizens, seeing the good effect in New York, giving them every support to carry their grants. On this account their cost was one-third less than those of New York. In New York, in 1856, the dividends were from 8 to 12 per cent.; in 1858 the increase in passengers and receipts were over 20 per cent., so that they must have been much greater, though this was a year of universal depression in trade. The shares are all from 30 to 40 per cent. premium. About four miles each, fares 2½d.

COMPARATIVE BUSINESS FOR 1856 AND 1858.

Roads.	Passengers.		Receipts in Dols.		Capital in 100 dol. Shares.
Second Avenue	1856.	1858.	1856.	1858.	
Third	3,367,371	4,867,371	173,989	243,368	800,000
Sixth	7,131,881	8,105,515	376,392	405,275	1,170,000
Eighth	4,757,108	5,240,978	237,855	262,048	750,000
Fourth*	6,097,299	6,829,452	304,864	341,472	800,000
	No. ret.	2,014,486	No ret.	100,744	

* Belongs to Haerlem R. R. Company.

The increase in two years being in passengers on four roads 3,689,657, and in receipts 159,063 dollars.

In Brooklyn there are four trunk lines, averaging four miles each, with some branches. Passengers carried, 7,575,823; receipts, 388,610 dols.; capital of company, 1,000,000 dols., in 10 dol. shares; dividends, 8 to 10 per cent.; fares, 2½d.

In Boston, one company running two branches, five and three miles; dividends, 11 per cent.; passengers in 14 months, 1,948,410; receipts, 169,297 dols.

In Philadelphia the first road was opened in 1858, in nine lines running 80 miles through the city and suburbs. The shares in these companies are 200 per cent. over par, as their grants cost them nothing, there being no opposition.

In New Orleans lines are now laying through the city, with the support of the corporation and citizens.

We have not yet got returns from Baltimore, Cincinnati, Chicago, St. Louis, and the other large cities; but we think these are sufficient to show that the Corporation of Dublin, instead of throwing obstacles in the way of the Irish Tramway Bill, should on the contrary give it every support. The great landed proprietors, such as Mr. Sidney Herbert, Lord Palmerston, Lord Meath, Lord Miltown, Lord Howth, Sir Charles Domvile, Mr. Vernon, as well as the other landlords, villa-holders, and residents in the neighbourhood of the city, should see that no factious opposition be given, but that the interest of the many should be looked to.—*Evening Mail.*

Correspondence.

"DUST" (HOUSE REFUSE).

[We would direct the special attention of our readers—householders or others—to this very important letter, from a gentleman whose exertions in the matter of sanitary reform have been and are most indefatigable, and whose competency to deal with the subject in its various branches is unquestionable.—Ed.]

Sir—Under this heading your correspondent, "A Householder and Subscriber," complains that "ash-pit cleansing in Dublin is defective and expensive," and that "in London, Manchester, Liverpool, and other cities, ashes are asked for as a compliment, and removed gratis," whilst "here it is quite a compliment to get it removed at a price."

Permit me to say that in London the dust, ashes, and cinders in every house are the property of the authorities—not that of the householder—and were first made so by act of parliament, when the burning of brick for building purposes was accomplished on the spot where the houses were being erected, the "breeze" and cinders being used for that purpose. At that time the revenue produced by its sale was very considerable; but change of circumstances as regards brick-making, building, &c., in London, has lessened the demand so much that in many districts the authorities are obliged to pay for the removal of the contents of the ash-pits, in place of farming it out at a profit as formerly. But, up to the present day, all the matter of *cesspools, which is not corporate property*, is removed by a very wealthy body of *gentlemen!* called nightmen, one of whom was a recent Lord Mayor of London; and they may very well become wealthy, because the fixed charge for removing every *load* of such matter is *one guinea*, and a gratuity to the men.

In Manchester, Salford, and Liverpool, it is different. The Lancashire farmers well know the value of night-soil as a manure, and have used it for many years. The town councils, therefore, took care when passing their sanitary bills to possess themselves of the *entire* house refuse, soil as well as ashes, &c; and also the power to oblige the construction of out-offices in such a manner that ashes and soil might be made to amalgamate, and thus, to a certain extent, neutralize the noxiousness. The acts also oblige the arrangements to be such that the offices may be easily reached by a rear entrance; and the authorities collect the ashes, depositing the whole on the canal side in yards arranged for the purpose, from whence it is sold at a fixed rate, and the proceeds brought to the credit of the borough.

The householders have only to sign a requisition requiring the removal, and whenever necessary that is at once done. But if the sales do not realize profit, which is frequently the case, because of the staff and contractors being paid out of corporation funds, and the whole—ashes, cinders, and filth—being made into one hideous conglomerate unsuited either for the purposes of manure, or fuel, or brick-making—the loss occasionally exceeds gain; the deficit is, of course, debited to corporate charges, and the ratepayers, therefore, in fact, pay for the removal.

But, even so, this is a systematic proceeding, producing much sanitary good and great public convenience.

In Dublin, however, it is quite different. There is no system, and your correspondent truly says, "it is a compliment to get ashes, &c., removed at a price," but more than that, it is, in reality, a very hazardous operation as regards health and property, and the result is, that it is deferred by all parties as long as possible, frequently until the sanitary section of the police interfere, and then it *must* be done within a given time, no matter at what cost.

What is the result? There is in every locality a very despicable person, called "*a dusthole-man*," or "*a guinea-finder*." He makes it his business to know the places where the policeman's olfactory nerves lead him to, and when he gets a summons to attend there, he is perfectly satisfied another summons has been issued to attend elsewhere—consequently, he can almost insist on any terms he pleases for the job. The terms are sure to be complied with after a battle. The whole establishment is placed in quarantine upstairs, whilst below some one, who cannot refuse, is deputed to watch the "gold-finder," and a very miserable night or two is passed during one of the filthiest operations, performed in the filthiest possible manner; so that, in reality, it is no wonder every inhabitant of Dublin defers it as long as he possibly can.

Now, what is the proceeeding of the "dusthole-man?"

He follows the example of the cuttle fish. He hates observation, and he spreads around him such a cloud of filth that no one could or would see what he is doing. In due time, however, he declares "the job done," though only half done; he fills his cart or carts, they move on, the outer gate is locked by the unhappy being who has been obliged to attend the operations, and in the first convenient stable lane that the dustman finds, within a few hundred yards of the premises, he deposits the savoury contents of the carts, and proceeds home to bed and to laugh at the way he bilked the policeman on the bate, and how he "done" the master of the house by leaving one half of the contents in the cesspool, and depositing the other half in the stable lane close by, *to be removed by the corporation carts in the morning.*

Might it not be worthy of the consideration of the authorities whether some plan could not be adopted by "their honors," by which the inhabitants could be saved from the extortionate demands of the gold-finders (the satellites of the sanitary sergeants of police), and from the extra payment which falls upon the ratepayers under the head of "scavenging," paid by the corporation for removing the contents of the ash-pits, &c., deposited in the stable lanes?

Jasper W. Rogers.

STEAM PACKET COMPANIES AND PHILANTHROPY.

Sir—In your last impression you express a hope that our steam packet companies will next season—and in connection with the English railway companies—afford increased facilities for excursionists to the other side of the channel, and I trust your good wishes may be realized. But seeing the interest taken by the "Dublin Builder" in all that is calculated to raise the working man in the social scale, I make bold to draw your attention to a subject—as yet, I believe, unnoticed publicly—very important to all classes of the community who are not burthened with a superabundance of financial resources, and try to improve themselves by seeing *what is to be seen*, at the smallest possible cost. During the excursion period, I went on a "voyage of discovery" to Chester—a glorious old town—having obtained at the North Wall a through ticket via Holyhead—deck and covered carriages—for FIVE SHILLINGS, a very moderate and the general charge—with the option of paying 2s. 6d. extra to obtain first cabin accommodation. The weather being very inclement, I availed myself and turned in to a comfortable berth in an excellent saloon. Of my peregrinations thence I will not trouble you with a history, but returning by Liverpool I found everything very different. The cabin and deck fares are respectively 12s. 6d. and *five shillings*.—both, in my opinion, much *too high*, and presenting a great discrepancy when compared with those of the Chester and Holyhead Company. I could not afford the former, and paid for the latter, with, perhaps, some 300 reapers, their wives and children, horses and sheep all in a medley for my companions. At first starting, the attention is diverted by surrounding objects, but clearing the channel in a gale of wind, and with pelting rain, one naturally looks for shelter and *bon repos* till shore again is reached. Alas, there was none! No friendly covering over the deck passengers save heaven's canopy. Fifteen hours of martyrdom,—drenched to the skin by rain and spray—without a seat but the bare deck, rendered slimy, filthy, and nauseous by sea sickness; men, women, and children indiscriminately huddled together—are what must be endured by those whose means compel them to travel on the deck of the steamers plying between Liverpool and Dublin. Is there a country in the world but "the Irish" that would countenance such a demoralizing state of affairs? Is there a people but "the Irish" would *submit* to it? There is literally no distinction between *man* and *beast*; pigs, cows, and their owners are alike (probably the former have more the advantage than otherwise) important to the directors of these companies! But this is not all! In each boat is a set of fellows who cringe on those apparently the least likely to ruff a severe voyage, to secure them as tenants for their berths in miserable holes under deck, at the modest sum of *half-a-crown*, and no doubt reap a harvest thereby. This state of things should not be permitted by the *authorities*, as it is certainly a relic of barbarity and a national disgrace. Compare the arrangements on board steam packets elsewhere, north, south, east, or west, with ours, and the contrast clearly shows a very discreditable result; one, however, not too late to be rectified.

A MECHANIC.

Notes of New Works.

A schoolhouse is being built in connection with May-street Church, Belfast. The centre portico of it, owing to its being surrounded with buildings, and in close proximity to the church, is but one storey high, and lighted necessarily from the roof. It has two fronts, each two storeys high. The one in Little May-street is neat, and agreeably relieved with white brick quoins round door and windows. The other front, in May-street, is of a more pretentious character, with engaged columns and entablature, capped with a balustrade. We presume the style will be the same as the church itself—viz., Ionic.

Sites have been selected for the erection of model schools in Cork, Enniscorthy, Derry, and Sligo, for which plans were prepared at the office of Public Works.

A new organ has been erected in Kilmore Church by Messrs. Telford, of this city. An organ from the manufactory of Mr. W. Browne has been erected in the church of St. Joseph, Portland-row.

In addition to the many building improvements now going forward at Bray, the Dublin and Wicklow Railway Company are about erecting a large house and two cottages adjoining the station, and after plans by Mr. George Wilkinson, architect. The houses recently erected by Mr. Joseph Kelly, timber merchant, are of first-class character, and a feature of interest in the neighbourhood. We should be glad to see many others similar rising up. New domestic residences, however, are in contemplation for spring, and full particulars shall appear.

Adjoining the new cathedral of Killarney, now in course of completion, are to be erected schools for 500 children.

An independent company with limited liability has been formed to erect a marine hotel and floating baths at Kinsale harbour, to be finished contemporaneously with the opening of the railway.

Mr. Pearcey, an eminent engineer, engaged on Welsh railways, states that a company is at command who would erect a pier and breakwater at Galway, and also a line of railway direct from Ennis to Galway, so as to connect Waterford and Milford Haven with Galway direct, provided the county and town of Galway would guarantee three and a-half per cent. on the outlay of the pier and breakwater.

A new market-house and town-hall are to be erected at Navan, and the Duke of Bedford has granted a free site.

Messrs. Barker have completed the stockade fence round the magazine, Phœnix Park, a fortnight before the time allowed; and, it is stated, to the perfect satisfaction of all concerned.

An Irish cross is to be erected in Finglas churchyard, over the grave of Dr. Lanigan, the eminent author of ecclesiastical history of Ireland. Another, after a design by Mr. J. J. M'Carthy, architect, has been placed at Glasnevin Cemetery, to the memory of the late Rev. Mr. Ennis, C.C.

The tower and spire of the new church of Kenmare, Co. Kerry, is just completed for the Ecclesiastical Commissioners. Mr. J. Welland, architect; Mr. D. W. Murphy, of Bantry, contractor.

The works of a new church at Waterville, Co. Kerry, were commenced about five months since for the Ecclesiastical Commissioners. Same architect and contractor. The entire of the stone-cutting and carpentry, is nearly all prepared; yet, from the difficulty of landing the necessary building materials at Ballinskellig Bay, the masonry is very much retarded.

The same contractor is after completing the works of a bridge over the Auvane river, and has commenced—by grand jury presentment—the building of another bridge on the Coomhola river, both near the town of Bantry, Co. Cork, from designs of Mr. Jackson, surveyor.

The new Catholic church of Tipperary, erected by contributions, is now all but finished. The interior is entirely complete, and the steeple has reached as high as the base of the spire. Style, early English. The belfry will contain a peal of seven bells, to be cast in Dublin. The interior of the building is divided into naves and aisle by two rows of pillars of Drombane granite, supporting a double arcade of pointed and richly decorated arches. The windows are filled with outline stained glass patterns laid on a white ground.

A new Roman Catholic church, in the Gothic style, and consisting internally of nave, aisle, three chapels, and choir, roofed with open timbers, stained and varnished, and presenting externally pointed arches and traceried windows, main doorways, and a tower and spire, &c., &c., has been erected at Stranorlar, Co. Donegal, after plans furnished by Mr. William Nicholson, of Manchester, an engineer; Mr. M'Nemivin, the builder.

A new church is to be built in Tralee, according to drawings now preparing by Mr. J. J. M'Carthy, architect.

CANADIAN ITEMS.

The most remarkable edifice of Toronto is the new University, erected by government, and to be supported by it. The building itself is the finest in the country, except the capitol at Washington.

It is in the mediæval style, with tower and turret and battlement—the details of decoration are carried out with great apparent fidelity. The front is 400 feet in length; length of right wing 285 feet, and of left wing 273 feet. The towers are 110 feet in height, the pinnacle of the highest is 165 feet from the ground level. Sir Francis Head, the Governor General of Canade, laid the cap-stone. The material of the building is a fine grey stone, the larger part of which is from Cleveland, Ohio. The stone of which the finer carvings are wrought is from Caen in Normandy. The roof is covered with a handsome Canada slate, arranged in imitation of tile work. On entering the building by the main entrance, there is a magnificent vestibule, designed for the collection of students and their professors, and for morning promenades, &c. The floor is inlaid with encaustic tiles, costing only 5 dollars per square yard; and which were imported from Shropshire, in England, and laid by a workman sent out for the purpose from the manufactory. In the right wing is a magnificent apartment, known as the Convocation Hall, designed for exhibitions, and other gatherings of the entire University. It is finished and decorated in the finest style of the Gothic art, and the carvings with which it is profusely ornamented, are of stone. In the vestibule or entrance to it, are some exquisite carvings in stone, by a Swiss artist, representing objects in nature. The carvings and traceries throughout the building seem almost infinite in variety and design. There is no reproduction of the same conception, but a remarkable versatility of genius is observable. Next to the Convocation Hall is the Senate Chamber, designed for meetings of the Faculty of the University. In this apartment, as in many others, are magnificent stone fire-places, with stately carved mantels of the same material. There is a students' reading room and a public reading room. The library is a very large apartment finished with white oak. The museum of natural history is decorated with black walnut carvings. There is a complete surgery, a handsome laboratory finished with blue and gold in antique style. There are several large and handsome lecture halls and recitation rooms.—Quaint chambers lurk in the heart of the stony towers. Many students will be accommodated in the University itself, for whom neat quarters are being provided. An immense dining hall is provided, with a gallery, for the accommodation of the fair upon gala days of parting; the kitchen, cellars, &c, are below. The dean of the University has a suite of apartments appropriated to his residence. A botanical garden, yet in its infancy, belongs to the University. There is an observatory, in which a telescope is mounted. The grounds contain about 20 acres inclusive of a long avenue, leading to the main building, planted with trees. The cost of the building is said to be 500,000 dollars, but the guide book says 8,000,000 dollars. The former amount seems low, the latter very extravagant. The first must be much nearer the truth.

The normal and model schools of Toronto are under the patronage of the state, and located in substantial and elegant stone buildings, which are freely opened to the public. The grounds are well laid out and tastefully kept. There is a very large collection of busts, illustrative of character as expressed in physiognomy, and a large museum of plaster casts, drawings and models, of classical, mediæval and early English architecture. The building contains also a fine gallery of paintings, chiefly copies, well executed, of the masterpieces of the Italian, Spanish and Flemish schools.

The Milwaukee and Detroit Railway has been completed with the superior finish and solidity characteristic of the Canadian railways. The road-way is well constructed, the station houses are neat and comfortable, and the sleeping cars commodious. The terminal stations of Grand Haven and Detroit are conveniently arranged, and adapted to expanding business.

The Great Western is an admirably constructed railroad—its refreshment station houses are as complete as any in the country—and yet it is not in all respects a favourite railway.

The city of Toronto is about sixty years old, and has now nearly 60,000 inhabitants. Its growth has been rapid, and its prosperity great but in common with all Western towns, it is now suffering severely from the reaction consequent upon too great inflation and expansion of business. Whole blocks of stores are to rent, and business paper is submitted to a most exorbitant shave. The present suspension of work upon the railways and the recent removal of the government offices to Quebec, have proved disasterous. The city is a fine one—abounding in handsome churches and public buildings—decorated with fine stores, business blocks, broad and straight streets—with many very handsome shops. The English, Presbyterian and Catholic churches are very handsome buildings. The Catholic Cathedral, with its showy decorations, furnishes a remarkable contrast to the severe simplicity of Cathedrals elswhere. The Market House is very large, and is usually crowded with people, displaying all manner of wares and commodities.

Monthly Railway Memoranda.

We are glad to find the Directors of the Ennis and Limerick Railway patronizing an Irish house for the supply of their carriages, waggons, &c., though we do not profess to rank amongst those who disbelieve that mutual advantages arise from reciprocal business intercourse with the sister countries likewise, and that trade should be exclusively retained on Irish soil.

Connected with the various requirements of the iron road, there are manufactories in existence in Ireland possessed of all the capabilities for executing almost any amount of work, and with as great facility as many of importance in England; and we may add that a large proportion of their business emanates from the United Kingdom, as well as abroad, clearly establishing public appreciation. Amongst those firms we may mention the old-established and eminent house of Rogerson, Dawson, and Russell, of this city, coachbuilders, from whom the abovenamed company have largely purchased; and the carriages are said to be on the most approved principle of construction, and for comfort and spaciousness are unsurpassed.

The plans for the proposed Kilkenny and Roscrea Junction Railway are in progress; Mr. Nixon, chief engineer.

The contract entered into by the Cork and Kinsale Railway Company with Messrs. Trowsdale and Son, of Stockton-on-Tees, is to complete the ten miles of line, ready for engines and carriages, at £4,100 per mile—a remarkably low figure. Several stone bridges have been substituted in lieu of the originally intended level crossings.

It is stated that the Waterford and Kilkenny Railway Company have paid off the £7,000 due to the Public Works Commissioners, and consequently taken the letting of the railway out of their hands.

The Dublin and Meath Railway is progressing towards completion, nearly the entire being ready for laying the rails, the arches of Boyne viaduct centred and partly turned, and the Assye and Grange bridges open for public traffic. Messrs. Moore, contractors.

New Mode of Staining and Figuring Wood.—The deals, veneers, or planks, as they come from the saw, are placed on a solid frame, and fastened down; after which an engraved roller, heated to a temperature suited to the quality of the wood, is passed over them, the pattern being thus burnt in. The surface is then planed smooth and French polished, leaving an effect, it is said, equal to that of the finest painting or staining. To Mr. King, of Clayton-square, Liverpool, is due the merit of the invention.

Review.

British Timber Trees. By John Blenkarn, Agricultural Engineer. Post octavo, half bound. Routledge, Warne and Routledge, Farringdon-street, London.

When going to press we received this valuable work, and are so greatly impressed with the importance of the subject, and the admirable style in which it is treated, that we cannot omit a hasty notice in the present number. The growth of British timber may be said to have claims on the attention of all British subjects, and to none more than the landed proprietors of Ireland. This work, by a practical man (an agricultural engineer), is treated as but such a man could treat the subject. Essentially practical in all its bearings, it enters fully into the method of rearing trees from the seed and otherwise, their subsequent management in woods, groves, plantations, &c. The essay on the improvement of barren and mountainous districts, and that on the valuation of timber, are entitled to all praise. The work concludes in giving practical tables and useful memoranda relative to timber. It is well got up, and cheap; and we can cordially recommend it to the notice of our readers. We shall refer to the subject in a future number.

GLASGOW CORPORATION WATER WORKS.

The Loch Katrine aqueduct, for the supply of the city of Glasgow with water, is one of the largest works of the kind which has ever been constructed in this or any other country, either in ancient or modern times. The Act for the construction of this work was obtained by the municipal authorities, after much careful investigation into the best mode of improving the supply of water to the city, in the year 1855, and the works were commenced in the following spring. The money for defraying the cost is borrowed on security of an unlimited rate upon the houses and property within the city. The undertaking is specially distinguished by the great extent and beauty of the Highland lakes from which the water is brought—the excessive purity of the water—the difficult and rugged character of the mountainous country through which the works for its conveyance have been constructed—and the large volume of water, no less than 50,000,000 gallons per day, which will be obtained for the supply of the city. The lakes appropriated to the purposes of the water-works for the use of the city, and for the supply of the mill-owners, fisheries, and other interests on the rivers from which the water will be abstracted, are Loch Katrine, 8 or 9 miles in length, with a surface of 3,000 acres; Loch Venechar, 4 miles in length, with an area of 900 acres; and Loch Drunkie, with an area of about 150 acres; having altogether a water surface of upwards of 4,000 acres, and containing within the limits to which they may be raised or lowered about 1,600,000,000 cubic feet of water. The drainage area of Loch Katrine is 22,800 acres, and of Loch Venechar and Loch Drunkie, 23,000 acres, making a total of 45,800 acres. On this the average fall of rain is between 70 and 80 inches per annum. That which falls on the collecting ground of Loch Katrine is about 80 inches on the average of five years' observations. If all the water which flows from the rugged mountain sides into Loch Katrine were impounded, it would afford a regular supply of 80,000,000 or 90,000,000 gallons. The storeage which is provided by the works which have been executed is equal to 50,000,000 gallons per day for 120 days without rain. It is obtained by raising the water by proper masonry and sluice-gates at the outlet 4 feet above the ordinary summer level, and by drawing it down, if necessary, to 3 feet below that level, giving 7 feet in depth in all. In like manner the requisite storeage for compensation to the River Teith, which consists of a regular guaranteed quantity per day, is obtained by raising Loch Venechar 5 feet 8 inches above its ordinary summer level, and drawing it down 6 feet, giving 11 feet 8 inches in all, and by raising Loch Drunkie 20 feet. The works at the outlets of the lakes are interesting and important works, at Loch Venechar especially. Provision is made for the discharge of floods as well as for the daily regulated supply, and for securing the passage of salmon and other fish by properly constructed "salmon ladders." Loch Katrine is 360 feet above the tide at Glasgow, an elevation which allows for the loss of fall in the conveyance of the water, and still secures a pressure of 70 or 80 feet above the highest summit of land within the city. The aqueduct from Loch Katrine to the city is about 34 miles in length, 10 or 11 of which consist of ridges of rock of the hardest description, forming the spurs of Ben Lomond, which towers to 3,000 feet above the level of the works. Through these ridges, in a tolerably straight direction, the aqueduct is carried principally by tunnelling, the tunnels being 8 feet in diameter, and having a fall of 10 inches in the mile. Across three deep and wide valleys the water is conveyed by cast-iron pipes, 4 feet in diameter, with a fall of 5 feet per mile, and at the distance of about 26 miles from Loch Katrine, near Mugdock Castle, a large reservoir of about 70 acres in extent, and containing 500,000,000 gallons of water, has been constructed. From this reservoir, the top water of which is 311 feet above the sea, the water is taken to the city by two lines of cast-iron pipes, each 3 feet in diameter, one being 7, and the other 8 miles in length. Of the 26 miles which lie between Loch Katrine and the service reservoir, 13 miles are tunnelling. 3½ miles are iron piping, and the remainder, where the ground has been cut open, is an arched aqueduct of 8 feet in diameter. having the same inclination as the tunnels. Where the ground has been excavated, it is filled in again over the aqueduct, which is covered throughout, and the surface restored to its original condition. There are in the whole work 70 distinct tunnels, upon which 44 vertical shafts have been sunk for facilitating and expediting the completion of the work. The first tunnel commences immediately upon the aqueduct leaving Loch Katrine. It is 2,326 yards in length, 600 feet below the summit of the hill, and has been worked, in addition to the open ends, by twelve shafts, five of which are nearly 500 feet deep. This tunnel is in gneiss and mica slate. The last tunnel is at the southern extremity of the aqueduct, just before it enters the service reservoir. It is 2,550 yards in length, almost wholly through whinstone, at a depth of 250 feet below the summit of the hill. Besides these, which are the two longest tunnels, there are, at intermediate places, others of 700, 800, 1,100, and 1,400 yards in length. The rock tunnelled through was in most parts of the most obdurate description. For several miles along the side of Loch Chon, where the work passed through a succession of ridges of mica slate largely mixed with quartz veins, the progress did not exceed 8 lineal yards in a month, although the work was carried on day and night. In the Loch Katrine tunnel, and generally in the mica slate, the ordinary average progress was about 5 yards in a month In drilling the holes for blasting the rock with gunpowder, a fresh drill or chisel was required for every inch in depth upon the average. About 60 drills were constantly in use at each face, and the cost of gunpowder alone was from 27s. to 30s. per lineal yard. The character of rock, however (as had been clearly foreseen when the work was determined upon), was such that no water occurred in any of the tunnels or workings so long as they were in the mica slate and clay slate, and there was therefore none of the inconvenience, delay, and cost from the presence of water which usually attend extensive tunnelling. When the works left the slate rocks and entered the old red sandstone, tunnelling was avoided as much as possible from fear of water; but even in this formation it was met with in much less quantity than had been anticipated. Not to speak of smaller constructions, there are 15 important iron and masonry aqueducts over rivers and ravines, some 60 and 80 feet in height, with arches of 30 feet, 50 and 90 feet in span; and in addition to about 46 miles of new pipes within the city for distributing the water to the inhabitants, there are about 20 miles of large cast-iron pipes of 3 feet, 3 feet 6 inches, and 4 feet in diameter, for conveying the water to the city. The number of people employed, exclusive of iron founders and mechanics, has generally been about 3,000; and for the greater part of these huts and roads and all other accommodation had to be provided—the country for the most part being of the wildest and most inaccessible description. The accuracy with which the works have been executed is most creditable to the resident engineers and inspectors. The difference between the levels taken for parliamentary purposes and those subsequently taken when the works were set out for construction, was only 1-50th part of a foot, or about ¼ of an inch in the 26 miles between Loch Katrine and the Mugdock Reservoir; and so truly have the tunnels been driven, that the junctions can only be distinguished by the different directions of the drill holes. The works will be completed for the conveyance of water to the city within 3½ years of the time they were commenced, and within the time originally contemplated, and at a total engineering cost of about £630,000, being about 10 per cent beyond the parliamentary estimate, after allowing for some additional works.

The Atlantic Cable.—Messrs. Beardmore and Robinson, electricians, have visited Valencia this week, and set on foot a series of experiments on the Atlantic cable. Encouragement as to the success of the undertaking, both as regards the resuscitation of the old and the laying of a new cable is in the ascendant. These gentlemen found room, in the state of the cable, to disseminate new courage among its friends.—*Tralee Chronicle.*

Motion by Heat.—A Red-hot Railway.—A curious apparatus has been described in the *Philosophical Magazine* illustrating a new mode of producing motion by means of heat. It consists of a massive circular horizontal railway composed of copper. The rails are made red hot, and a thin ball of German silver is then placed upon them. Immediately the ball is placed upon the rails it begins to travel, and continues to be propelled in a uniform direction as long as the rails remain sufficiently hot.

Miscellaneous.

The Victoria Bridge, Montreal.—The Victoria Bridge, it is anticipated, will be ready for traffic by the end of this month. The last pier of the twenty-four has been completed. Its foundations having been laid only eight weeks ago, it has been constructed with great rapidity; and all that now remains to be done is to complete the laying of the tubing, for which the necessary staging is now being erected between the tubes not yet connected. It may be worth repeating that the tube connecting the two central piers contains upwards of 700 tons weight of iron. The weight of iron in the portion of the tube between any two of the other piers is about 350 tons. The distance between the two central piers, affording a channel for the passage of vessels, is 300 feet, and the height of the tube above the water, 60 feet. It is estimated that the cost of each pier is about £40,000. The grand inauguration of this stupendous enterprise will not take place till next year; but we understand that immediately on its completion the bridge will be open for regular traffic. A full description may be found at page 124.

Engraving without an Engraver.—One of the most curious of the many remarkable applications of photography is that of producing by its means copies of engravings and other works of art. The almost perfect reproduction of a drawing or an engraving, without the intervention of an engraver or copyist, would have seemed a few years back almost an impossible thing—yet we know that photography accomplishes it daily. But we have become so familiar with photography that we almost cease to wonder at its marvellous doings. Still the reproduction, true and beautiful as it is, is a photograph and not an engraving. We have now to introduce to the notice of our readers a new process by which it has been found possible without even the aid of photography, in fact, as we may say, by mere mechanical means, to make a perfect fac simile of an engraving—whether a copperplate or a woodcut—and not only to make a copy of it, but to produce a plate or block for surface-printing, that shall yield impressions by the ordinary printing-presses quite equal to the original. But even this is not all. Blocks can by this process be produced, without the aid of any engraver, which shall print these fac simile enlarged or reduced to any extent that may be desired. We have, for instance, seen a whole-page wood-cut from the *Illustrated News*, reduced to half, and enlarged to double the original dimensions, without any loss of sharpness or vigour, and without the smallest distortion being anywhere discoverable, even with a lens. So again with an old and imperfect map: and so with an impression from a steel engraving. But it is equally applicable to original designs made with a peculiar ink and paper. Without the assistance of an engraver, blocks for surface-printing can be prepared from them, either of the same or any larger or smaller size. But further, the blocks for printing can be produced of an altered form as well as of a different size. Thus the normal pattern for printing on a dinner service can be reproduced, say in its original size and round form for the ordinary dinner-plates, half, or any other proportion of the size for desserts or cheese-plates, and twice the size and oval for dishes, &c. All this we have said is a mechanical process, but it is also a scientific one, and to be properly worked out we need hardly say it will require artistic guidance. The textile and the ceramic manufacturer are almost equally interested in this invention with the publisher, but the range of its application seems to be commercially almost unlimited. The process is carried through by means of elastic blocks and electro-metallurgy: all that is required to be furnished the manipulator is an impression of the plate to be copied. The inventor is Mr. H. G. Collins, who has protected his invention by patents. A company called the Electro Printing-Block Company, has been formed for working it. That the invention is regarded by business men as thoroughly practical, may, we suppose, be taken for granted, since the names of some of our leading publishers of illustrated works and ceramic manufacturers are in the list of directors. When the scheme is more thoroughly in working order we may return to the subject, to notice the process itself somewhat more particularly.—*Saunders.*

Curious Property of Cast Iron.—Cast-iron dilates permanently by repeated heating. Cast-iron ferrules for locomotive tubes will remain tight where wrought-iron ferrules might leak, and for this reason the former are used generally in American locomotives.

The submarine telegraph between Malta and the opposite coast of Sicily, at Alga Grande, has been successfully laid. The mid-portion of the cable is of great strength, being equal to sustain a strain of from ten to twelve tons without parting, and the shore ends are of nearly double the strength. The depth of water throughout is within 80 fathoms, so that if any accident should ever occur it might be remedied without much difficulty.

The work of erecting a new Catholic church at Caryville, on Broadway, is being commenced The corner-stone of a new church was laid recently at Malone, N.Y.

A New Joint in Joinery.—The usual process in making boxes has been to dovetail the sides and ends together. Mr. Hine, the fancy cabinetmaker of St. John-street road, London, has completely superseded that process by his patent "improved self-supporting joint." Mr. Hine obtains his joint by making with circular saws two tongues or fillets at right angles to each other; one of these tongues being on the edge, the other on the side of any given piece of wood, thick or thin. By the same process he forms two grooves in another and similar piece of wood, also at right angles to each other. The two tongues are then run into the two grooves, a perfect joint is the result. strong and so complete that it is impossible to pull the two pieces of board apart laterally or in the plane of either one. By merely reversing the position of the tongued bond an angular joint is produced. The process can be adopted in the making of wooden or stone stairs, by which each "riser" would be locked into the "thread" that the stairs would be self-supporting, There is scarcely a thing in the whole range of building or cabinetmaking to which this joint could not be applied with a saving of labour truly surprising; so much so, that one man in making boxes can do as much in five minutes as by the ordinary means he could do in an hour. For ships' decks, railway platforms, flooring, &c., the joint would be invaluable. Mr. Hine thinks of applying his joint to window-sashes, doing away with beads and weights, at the same time preventing draughts and the disagreeable shakings of the sashes whenever there is a little wind. The whole of the process being of the most simple kind, not a plane or joiner's tool is required. Metal can be employed in the same way. Mr. Hine exhibited to us a brass box, air tight, made by his joint, without the aid of solder or rivets; the pieces being simply put together by placing the tongues in the grooves, and as easily taken to pieces. We understand the joint has been submitted to government inspectors, and favourably received.—*Spectator*.

A statue of Notre Dame de France, of extraordinary dimensions, is in course of erection on the Rocher de Corneille, near Le Puy (department of Haute-Loire). The statue is 53 feet high, and a staircase in the inside will give access to the head, whence there will be an extensive panoramic view. The statue is of iron, cast in pieces from guns taken at Sebastopol. The design is by M. Bonassieux.

The deposition of dew, on the glass of windows, arises from the air of the apartment—charged with aqueous vapour by the breath of those within—being cooled on account of contact with the glass, the temperature of which is lowered by the coldness of the external air.

Drinking Fountains.—Few of the social and sanitary movements which have distinguished the last twelve or fifteen years deserve greater attention and encouragement than that which has for its object the establishment in all our large towns of free public drinking fountains. Recently, a man, in passing along the streets, had few means of quenching his thirst, except by a resort to the public house. It might be said that there are the pumps; but pump water is notoriously impure to a frightful extent; besides, many pumps are not even provided with the rough accommodation for drinking of an iron bowl, such as we see in some cases. How often, in the hot days of summer, did we observe a crowd of errand boys and ragged youths clustered about the pumps, snatching insufficient and not very inviting draughts by means of their hands and caps! How eagerly were their solicitations for "a drink of water" addressed to any one who may have come to the spot with a vessel! These poor wanderers of the streets are deserving of consideration in a matter so important. The new drinking fountains are provided with a trough for cattle, and for the comfort of those wretched dogs which run homeless about the streets, and in the sultry weather of July and August not unfrequently go mad, and inflict mortal injury on human beings, for the want of the very fluid which, when rabid, excites their deepest horror. Free public fountains may safely be set against any number of Maine Liquor Laws for bringing people into habits of sobriety.

The electric telegraph has been extended to Tralee, which is now in communication with the metropolis.

The municipal council of Paris has decided on the building of ten new churches, which are to be completed in eight years.

NOTICE.

Orders for Subscriptions to, and Advertisements for, The Dublin Builder, *will be received at the Proprietor's Office*, 17, Lower Gardiner-street. *Wholesale Agents*—Messrs. W. H. Smith & Son, *Sackville-street* (*from whom* "The Dublin Builder" *may be had at every Railway Station*), *and* George Mason, 24, *D'Olier-street.*

Payments (by Post-office Order or otherwise) for Advertisements in this Journal are to be made solely to PETER ROE, at the Printing Office, 42, Mabbot-street, Dublin.

Auctions, Sales, &c.

Auction of Mahogany and other Timber.

JAFFRAY BARCROFT will SELL by AUCTION, at Timber Stores, NORTH-WALL, without reserve, on TUESDAY, 22nd November, 1859 45,500 feet of prime HONDURAS MAHOGANY, direct from the Bay, suited to Cabinetmakers and Coachbuilders. Immediately after the above will offer

200 tons of Crown Memel,
100 „ „ large board Pine,
36 „ „ Birch,
28 tons of Ash,
14 pieces of select Walnut,
1,200 „ „ first quality Pine Deals.

For further particulars apply to J. Martin and Son, Merchants, 10, North-wall, or

JAFFRAY BARCROFT, Broker,
42, Great Brunswick-street.

TO ARCHITECTS, COUNTY SURVEYORS, ETC.

A DRAUGHTSMAN, just disengaged, offers his services to professional gentlemen, on moderate terms. Is fully acquainted with office routine, can design, make working drawings, survey, take out quantities, &c. Address, "Draughtsman," Dublin Builder Office.

A CLERK OF WORKS, having just superintended an important building, and who can produce satisfactory testimonials, wishes for an engagement. No objection to a country town. Apply by letter to Mr. W., "Foreman," Dublin Builder Office.

WANTED, by an Architect, a good Perspective Artist and Gothic Architectural Draughtsman. Salary liberal, and permanent engagement if found to answer. Enclose references, &c., to "F.," Dublin Builder Office.

BUILDER'S CLERK, Indoor or Outdoor.—A middle-aged Man, who can keep books, time accounts, and attend to the general business of a Builder's Office and Yard, desires employment. He would act as collector through town, or as clerk at a large building. Address, for a week, "Builder's Clerk," Dublin Builder Office.

Publications.

NEW WORK ON THE GENERAL IMPROVEMENT OF LANDED ESTATES.
In post 8vo, price 5s., half-bound,

BRITISH TIMBER TREES: their Rearing and Management, from the Collecting of the Seed to all the subsequent Stages of their Growth. By JOHN BLENKARN, C.E.

London: Routledge, Warne, and Routledge, 2, Farringdon-street, City.

TO TIMBER MERCHANTS AND BUILDERS.
Now in the press, price 7s. 6d.

THE CALCULATOR; or, TIMBER-MERCHANT'S and BUILDER'S GUIDE.
By William Richardson & Chas. Gane, of Wisbech.

Containing about 500 pages, 12mo. Should be on the desk of every one connected with the trade, and will be found invaluable for casting and checking invoices, etc., both in reduction of quantity and money, with other information. Order early of

JOHN WEALE, High Holborn.

VALUABLE BOOKS, relating to ARCHITECTURE, BUILDING, and CIVIL ENGINEERING, on SALE, at greatly Reduced Prices, at BRADLEY BATSFORD'S, 52, High Holborn, London, W.C.

Architectural and Scientific Books bought or exchanged. Catalogues sent Post free.

IBBOTSON's Improved OAK STAIN, for imparting to New Deal the appearance of Oak, and to New Oak the appearance of Antiquity.

It is about half the expense of paint, and is easily applied with a brush. Being an Oil Stain, it has the important advantage over all other stains of being impervious to wet. It produces a bright gloss, but if a high polish is required, the proper varnish can be applied. It requires no size or previous preparation of the wood.

The Stain (with the proper varnish, if required), of three shades—Light, Middle, and Dark—is sold in Bottles at 6d., 1s., and 2s. each, or by the Gallon, at 10s.

Sole Agents—BOILEAU and BOYD,
(Late John George Boileau and Co., Mary's-abbey),
92, BRIDE-STREET, DUBLIN.

THE LAMP, a Weekly Illustrated Journal of Literature, Science, the Fine Arts, etc. Edited by James Burke, A.B., Barrister-at-law, Author of "Abridgment of Lingard's History of England," "Memoir of Moore," "Memoir of Edmund Burke" (prefixed to Speeches), "Annual Abridgment of the Statutes," etc.

The Lamp contains deeply interesting Tales; beautiful Illustrations of Places and Events of Interest; Lives and correct Portraits of distinguished Characters; Essays by eminent writers; Poetry of a high character; Reviews of, and Extracts from, the newest and most agreeable Books; Abstracts of important Lectures; entertaining Varieties; and Notes on important Events.

Six Copies sent prepaid for Sevenpence, and the Monthly Parts for Eighteenpence a quarter.

The extensive circulation of the Lamp among all classes (to which that of no other Catholic periodical approaches) offers a most favourable medium to Advertisers. The Terms are—*in the Weekly Number:* Not exceeding 4 lines, or 36 words, 2s.; for every additional line, or 9 words, 4d. *On the Monthly Wrapper:* Not exceeding 4 lines, or 36 words, 1s. 6d.; for every additional line, or 9 words, 3d.

London: The Catholic Publishing and Bookselling Company (Limited), Charles Dolman, Manager, 61, New Bond-street, W., and 6, Queen's Head Passage, Paternoster-row, E.C.; and J. Mullany, 1, Parliament-street, Dublin.

Just Published, price One Guinea,

THE beautiful and highly-finished Chromo-Lithograph (a *facsimile* of the celebrated Oil Painting by Tracy), entitled

"THE PEASANT'S GRAVE."

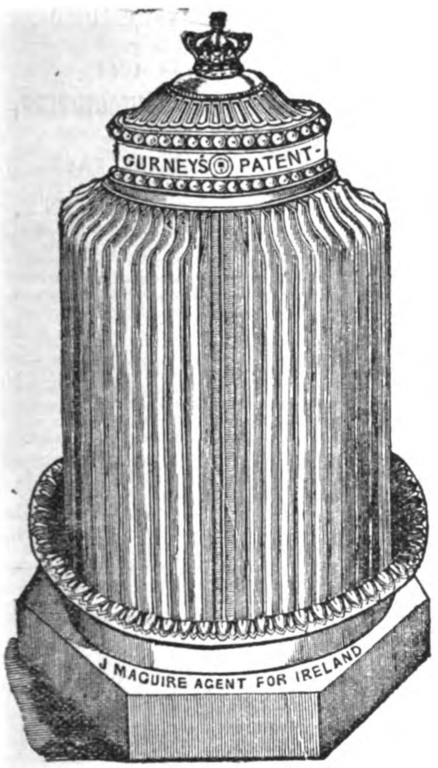
It has been recommended as a prize to Subscribers by the Art Union of Ireland. Copies to be had from

E. J. HARTY, Chromo-lithographer,
9, DAME-STREET, DUBLIN,
Or from any Printseller.

A handsomely framed Copy, with packing case, will be remitted free to any part of Ireland on receipt of a Post Office order for Two Guineas.

TO ARCHITECTS AND BUILDERS.

THE Parents of a Lad, aged 15, wish to place him indoor with a respectable Architect or Builder, in a good country town. State terms required, and advantages offered, by letter, to "Hibernicus," Dublin Buider Office.



GURNEY'S PATENT
J MAGUIRE AGENT FOR IRELAND

GURNEY'S PATENT STOVES AND HOT WATER BATTERIES.

THE above are in successful operation in both Houses of Parliament, St. Paul's Cathedral, Kensington Museum, the New Museum, Royal Dublin Society; Birr Barracks, &c.; and may be seen at work in

JOHN MAGUIRE'S NEW WAREROOMS,
10, DAWSON-STREET.

He has all sizes in Stock suitable for Churches, Warerooms, Halls, and Institutions.

Agent for the following Patented Goods:—

Gurney's Stoves and Hot Water Batteries.

Whitfield's Fireproof Safes & Chests.

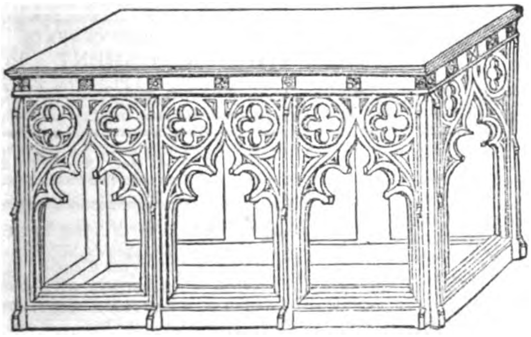
Brown's Improved Close Kitchen Ranges.

Eastwood's compound-action Churns from two to fifty gallons.

Simpson's Ice Machines and Freezing Powders.

Kent's and Worth's Knife Cleaners and Mangles.

JOHN MAGUIRE,
MANUFACTURING IRONMONGER,
10, DAWSON-STREET,
DUBLIN.



Executed for Grangegorman Church.

JOSEPH DIGGES,

ECCLESIASTICAL UPHOLSTERER,
AND
Manufacturer of Church Furniture and Appointments.

COMMUNION TABLES, CHAIRS, LECTERNS, KNEELING STOOLS, BENCHES, ETC.,
In Plain or Carved Woods.

ALTAR CLOTHS, TABLE COVERS, CHANCEL CARPETS, CUSHIONS, AND PULPIT DRAPERIES,
All made to order, with good taste and economy.

Blinds to suit every description of Church Windows. Architects and others can depend on having their Designs carefully carried out.

27, LINCOLN-PLACE, DUBLIN.
(Opposite the Turkish Baths.)

TABLE GLASS—FRENCH SHADES—WINDOW GLASS.

TO LARGE DEALERS, or Private Purchasers, requiring the numerous articles coming under those denominations, the Subscriber offers his fully-assorted Stock, the product of Manufacturers FIRST in their respective branches, at Prices not hitherto offered in the Market, meeting the wish and means of all.

JOHN CARRICK,

5, MARY'S-ABBEY,

DEALER IN ROMAN, PORTLAND, AND MASTIC CEMENTS, PLASTER OF PARIS.

N.B.—The attention of Nurserymen, Gardeners, and Amateur Florists is specially directed to the PROPAGATING GLASSES, etc., etc., with which he is constantly supplied.

MESSRS. JAMES & EDWD. BARKER,
CONTRACTORS
To Her Majesty's War Department, and the Ecclesiastical Commissioners for Ireland.
All orders executed to satisfaction.
32, UPPER ABBEY-STREET, DUBLIN.

MESSRS. O'DUFFY AND EGAR, SURGICAL and MECHANICAL DENTISTS, may be consulted *free* at 75, DAME-STREET, opposite the Lower Castle Yard.

ESTABLISHED THIRTY-FIVE YEARS.

F. SURRIDGE (late of London), Manufacturer of Photograph Apparatus, Scientific Modeller, &c.

67, AUNGIER-STREET, DUBLIN.

SHEILS AND SCOTT respectfully announce their removal to their new and more extensive PREMISES,

29, WESTMORELAND-STREET.

W. B. MICKLETHWAITE, STAMFORD ARCADE, ASHTON-UNDER-LYNE, near MANCHESTER, ENGLAND, and Manx Arms Hotel, 38, Fleet-street, Dublin, Agent for Green and Jackson's Mortising Machines, Mr. Horsfall's Patent Mitering Machine, Mr. Furness' Machinery, Messrs. Greenwood and Batley's Improved Ribbon Sawing Machines, and J. Ellis, jun., and Mr. Cordingley's Steam-engines, and other Machines worked by hand or power, for Builders, Contractors, &c.

THE SUBSCRIBER begs leave to announce to the Noblemen and Gentlemen o Ireland that he has commenced business in BALLINASLOE as AGRICULTURAL ENGINEER and ARCHITECT.

From his extensive experience in the west of Ireand, promptitude in business, and moderate charges, he hopes to merit a share of public patronage.

Lands levelled and laid off for irrigation, and Rivers levelled and laid off for water mains. Drawings and Specifications for Meal and Flour Mills, Threshing Mills, and Saw Mills, given on the most reasonable terms. WM. MAXWELL.

Dunlo-st., Ballinasloe, May, 1859.

TO ARCHITECTS AND BUILDERS.

HENRY E. JAQUES Architectural Carver (late of Myres's, of London), begs to inform the above that he has commenced business at 36, Middle Gardiner-street; and having a thorough knowledge of Architectural Carving, he respectfully solicits their patronage.

N.B.—Plain and Fancy Block Letters on the shortest notice, and at the most moderate terms.

36, MIDDLE GARDINER-STREET.

To Architects, Engineers, Artists, and Amateurs.

WM. M'CLEARY WIGHTMAN,
PRINTSELLER & ARTISTS' COLORMAN,
22, *NASSAU-STREET*,

Has always on hand a large and varied Stock of Drawing Materials, Paper of different sizes, Colors Brushes, Pencils, &c., which professional gentlemen and others will find adapted to their requirements, & moderate in price.

ARTISTS' WAREHOUSE AND PHOTOGRAPHIC GALLERY,
22, NASSAU-STREET.

THEODOLITES, LEVELS, CIRCUMFERENTERS, MATHEMATICAL DRAWING INSTRUMENTS, SCALES, RULES, TAPES, T SQUARES, &c.

JOHN ARCHBUTT, 20, Westminster Bridge Road, Lambeth. near Astley's Theatre, respectfully calls attention to his Stock of the above articles, manufactured by superior workmen. The prices will be found considerably lower than ever charged for articles of similar quality. An illustrated price list forwarded free on application. 8-inch Dumpy Level complete, 6 guineas; 10-inch ditto, 8 guineas; 14-inch ditto, 10 guineas; with compass, 1 guinea each extra. Best 5-inch Theodolite, divided on Silver, 18 guineas.

SURVEYING, ENGINEERING, ARCHITECTURE, &c.—PRACTICAL INSTRUCTION is given in SURVEYING, Levelling, Civil Engineering, Architecture, Building, Draughting, Mapping, Measuring and Valuing of Land, Timber, Buildings, &c., by Messrs. HYDE, SMITH, and LEWIS, Civil Engineers, Architects, Surveyors, etc., in a short Course of Instruction on moderate terms, including FIELD WORK and the use of the INSTRUMENTS. For Prospectuses, apply at the Offices, 24, Guilford-st., Russell-square.

N.B.—An Architectural, Engineering, and Mechanical Class for Architects, Builders, Engineers' sons, etc., on moderate terms, including instruction in Drawing, Coloring, Taking out Quantities, etc.

THE PATENT CRYSTAL WINDOW BARS, adapted for Domestic Windows, Shop Fronts, Conservatories, Skylights, Verandahs, Exhibition and Counter Cases, Aquariums, Fern Cases, etc., etc., combining perfect transmission of light, durability against rust or decay, and economy in the facility with which they are kept clean.

Aquariums with Slate or Marble Bottoms of various sizes, with or without Fountains, also of glass.

Manufactured by LLOYD & SUMMERFIELD, Park Glass-Works, Birmingham.

All kinds of Flint Glass, cut and plain, Coloured Window Sheet, Optical Sheet, Coloured Lenses, etc.

Agents at Dublin—Messrs. SIBTHORPE and SON, CORK-HILL.

TO BUILDERS, SHIPPERS, ETC.

J. JOHNSON informs the above that he is open to supply them with any amount of GROUND WHITE LEAD and COLORED PAINTS, at Five per Cent. lower than the current prices. J. Johnson's Lead and Paints are recommended to the Trade as possessing more body, cover better and easier than any other, and will retain color in any climate. All orders to be addressed to

J. JOHNSON, KEW BRIDGE, BRENTFORD, W.

Building Materials.

SAWING, PLANING, & MOULDING MILLS,
GREAT BRUNSWICK-STREET, DUBLIN,
MICHAEL MEADE,

HAVING nearly completed the extensive Buildings and Machinery for Sawing, Planing, Moulding, Tenoning, Grooving, &c., Timbers at his new works, begs to inform his friends and the public that he has REMOVED his business from Westland-row. In conjunction with his business as Builder, he has now opened a new department for the sale of all descriptions of Materials used in Building. Timber, Deals, Laths, Prepared Flooring, Skirtings and Mouldings of all Sizes and Patterns always on hand. Doors, Sashes, Sash Frames, Shutters, Architraves, &c., made to order on the shortest notice and most reasonable terms. Being the *only* Manufactory of the kind in Dublin, it offers an advantage to persons Building which has not hitherto presented itself in this country.

From M. M.'s long practical experience in the working of all descriptions of Timber, persons requiring their Timber sawn or planed will find a great advantage in sending it to the above Mills.

THE CITY SAW MILLS.

JOSEPH KELLY having purchased the interest in Nos. 66, 67, and 68, THOMAS STREET, which adjoin the Saw Mill Premises, 128, FRANCIS-STREET, begs to inform the Public the principal entrance will be 66 and 67, THOMAS-STREET (opposite John's-lane). The large space acquired will give increased facility, and prevent any complaint as to delay.

Having also erected extra Machinery for Sawing, Planing, Moulding, &c., estimates can be furnished for Architraves, Doors, Sashes, Skirtings, &c.

The SLATE, PIPE, TILE, and BRICK YARD, JOHN'S-LANE, is largely stocked with Wyatt's best Bangor Slates, Doulton's Sewerage Pipes, Bridgewater Fronting Bricks, Oven Tiles, &c.; Chimney Tops and Flue Linings.

The WHOLESALE YARD, SIR JOHN'S-QUAY, contains

10,000 Seven-inch Battens.
4,000 Yellow Miramichi Battens and Planks.
50 Tons of Black Birch of large dimensions.
100 Tons of Memel.
200 Norway Spars.
Norway Red and White Deals.
Which will be sold low, to close Sales.

Now discharging, the "AGNES," from St. John's, with an assorted Cargo of Deals.

Vessels discharging at Sir John's-quay, viz.:—
AGNES, from St. John's, Deals.
YORK, do. do.
CASCADE, St. Stephen's, Deals; and daily expects *Triton*, from Memel.
800 Pieces of Crown Memel.
20 Fathoms of Lathwood.
Also Loading,
SWARTHWICK, Quebec.
SOPHIE, Richabucto, Timber and Deals assorted.

THE CITY SAW MILLS,
66 and 67, THOMAS-STREET
(Opposite John's-lane),
Late 127, FRANCIS-STREET.
Dublin, July, 1859.

TIMBER AND SLATE STORES.

N. J. ANDERSON, is now discharging at his Wharf, 28, SIR JOHN ROGERSON'S-QUAY. Two Cargoes of BANGOR SLATES, *ex the Lady Buckley and Maria*, of Beaumaris; Two Cargoes of superior English Red Fronting BRICKS and TILES, *ex the Elizabeth and Cannet*, Bridgewater; Two Cargoes of FIRE BRICKS and TILES, *ex the Chester and Shifty*, from Flintshire; Doulton's Glazed superior Sewerage Pipes, Bends, Chimney-top Windguards; also for Sale, 30 Tons of best American Ash Mahogany Planks, 30 to 36 in breadth, suitable for Counter Tops; Oak, Birch, &c. Lowest Cash Prices.

TIMBER AND SLATE STORES,
67, GREAT BRUNSWICK-ST., and 28, SIR JOHN'S-QUAY.

MAHOGANY, RIGA & AMERICAN OAK, TIMBER & DEALS, FOREIGN FANCY HARD-WOODS, VENEERS, etc.

JOSEPH BOOTH respectfully invites the attention of Manufacturers, and the Public generally, to his extensive and well-selected stock of above, most of which is thoroughly seasoned and fit for immediate use.

The MAHOGANY STOCK includes the principal varieties, and of size and quality suited for Cabinet-making and Building Works, Shop Counters, Fittings, etc.

DEALS of various kinds, qualities, and prices, sawn into all the usual sizes, and if required will be supplied ready for use, planed and jointed.

ESTIMATES given for the supply of any quantity, and all orders carefully and promptly attended to.

BOOTH'S
TIMBER STORES, AND ARTISTS' TOOL WAREHOUSE,
35, GOLDEN-LANE, DUBLIN.

SLATES, TIMBER, SEWER PIPES, FLUE LINING, PLASTERING, and SLATING LATHS, Fire Bricks, Ridge Tiles, &c., Planed and Jointed Flooring, Mouldings, &c., for Sale, on very moderate terms, at the

LIFFEY SAW MILLS,
12 AND 13, SIR JOHN ROGERSON'S QUAY,
(Corner of Windmill-lane).
HUGH KELLY, PROPRIETOR.

BUILDERS' GOODS, Kitchen Ranges, Ironmongery, Window Glass, Oils, Paints, and Paper Hangings, of the best qualities, at MAURICE BROOKS', SACKVILLE-PLACE, DUBLIN.

THOMAS TICKELL'S TIMBER & SLATE STORES,
193 & 194, NTH. KING-STREET (Corner Green-st.)

Importer of Fire-blocks, Bricks, Kiln, Oven, Floor, Ridge, and Pan Tiles, Bath Brick, Ridge and Sink Stones, Fire Clay, &c. Country Orders attended to.

TIMBER AND SLATE STORES,
SWIFT'S-ROW, LOWER ORMOND-QUAY
(Near the Metal Bridge).

Mahogany, Cedar, Rosewood, Walnut, Birch, American Ash, Pine, Deals, Staves, &c., &c. A large Stock of Staves on hands. Country Orders promptly attended to. GEORGE FINNEGAN.

OFFICE OF THE "CROWHILL, MILTON, AND KENMUIR QUARRY COMPANY (Limited)."
51, RENFIELD-STREET, GLASGOW.

HAVING entered upon a Lease of those extensive and well-known Quarries—Crowhill, Milton, and Kenmuir, near Bishopbriggs—long wrought by Mr. Wm. Neilson, parties desirous of supplying themselves with a first-class Rock, will be served promptly with any quantity, however large.

From our facilities for despatching materials by private Railway to Forth and Clyde Canal, Builders in Ireland will find this a cheap and ready mode of supplying themselves.

Any orders with which we may be favoured, shall receive our best attention.

WILLIAM GRAY, Secretary.

NOTE—We refer for sample of our stone to the new National Practising Schools, at Lower Gardiner-street, Dublin.

BATH STONE OF BEST QUALITY.

RANDELL AND SAUNDERS, QUARRYMEN and STONE-MERCHANTS, BATH.

List of prices at the Quarries and Depots, also cost of transit to any part of the United Kingdom, furnished on application to Bath Stone Office, Corsham, Wilts.

BATH STONE OF BEST QUALITY.

PICTOR AND SON, QUARRY PROPRIETORS and STONE MERCHANTS, BATH. List of Prices of Box Ground, and Corsham Down Stone (loaded in railway trucks at Box or Corsham Station), also cost of transit to all parts of the kingdom forwarded on application to Bath Freestone Works, Box, near Chippenham, Wilts. Dressings (both plain and ornamental) prepared ready for fixing. Vases, Tombs, Chimney-pieces, &c.

Statuary, Marbles, Cements.

ELLIS AND CO.,
PORTLAND CEMENT MANUFACTURERS,
MALONE MILLS,
BLACKSTAFF ROAD, BELFAST.

ALEXANDER BALLANTINE, Stone and Marble Works, Chimney-piece Warerooms, &c., 126, UPPER DORSET-STREET (nearly opposite Granby-row), Importer of Caen Stone, Portland, and Freestone, Monuments, Tombs, Headstones, &c.; Geometrical Staircases and Flaggings executed on the shortest notice, and in a workmanlike manner.

THE M'ANASPIES, Practical, Plain, and Ornamental Stucco Plasterers, Scagliola and Figure Artists, Staturists, and Asphalte Workers, &c.
PHOTOGRAPHIC AND STATUARY GALLERIES,
31, GREAT BRUNSWICK-STREET, DUBLIN.

CHIMNEY PIECES—in Italian, Belgian, Irish, and English Marble; Enamelled Slate, and Cast Iron: suitable for Drawing-rooms, Dining-rooms, Bed-rooms, &c. A very large Stock to select from. MAURICE BROOKS, Sackville-place, Dublin.

Plaster of Paris.
Roman Cement.
Portland Cement.
Patent Mastic Cement.
John's Patent Stucco Cement.
Keene's Patent Marble Cement.

Of the best quality, to be had of

SALMON RICE, AND CO.
3, ANGLESEA-STREET.

Also Crown, Sheet, and Plate Glass; Fire Bricks Tiles, &c; Painters' and Plasterers' Brushes.
Gypsum for Agricultural Purposes
STEAM MILLS AND MANUFACTORY—CROWN-ALLEY.
Established, A.D. 1780.

BEST CEMENTS.

ROMAN CEMENT, PORTLAND CEMENT, and PLASTER PARIS STORES,
10, SIR JOHN'S-QUAY, DUBLIN.

GEORGE HOLMES and Co. are constantly supplied with the above materials of genuine quality, direct from the best manufacturers. Also Sewerage Pipes, Junctions, Bends, &c. Agents for MAW and Co.'s Mosaic and Encaustic Tile Pavements.

SELLING OFF, the largest and best Stock of Waterproofs, Vulcanized India Rubber and Gutta Percha in the Kingdom, at

FERGUSON AND CO'S
103, GRAFTON-STREET, DUBLIN,

who, having taken the large and extensive Premises 105, GRAFTON-STREET, will offer during the period the necessary alterations are being made, the entire of their present Manufactured Stock at a considerable Reduction from First Cost. This is an opportunity well worthy the attention of the Trade, Country Dealers, and the Public, to obtain First-class Goods.

All Garments warranted not to stick.

Vulcanized Oriental White Coats, Capes, and Hoods.
" Black Coats specially for Clergymen.
" Heavy Beaverteen & Swansdown Coats.
" Ladies' Cloaks, Capes, and Hoods.
" Leggings and Trowsers.
" Reversible Coats.
" Car & Travelling Aprons, Railway Rugs.

OIL GOODS,

Coats, Leggings, Trowsers, Jackets, Sailors' Hats and Sou-Westers, Capes and Coats for Farm Servants, 42s. per dozen.

VULCANIZED CART, RICK, & DRAY COVERS. Vulcanized India Rubber Machine Beltings, Socket and Flange Washers, Engine Sacking, Pump Valves, Buffer Springs, Hard Vulcanized and every article of Rubber in connection with Mechanical, Engineering, Railway and Manufacturing purposes. Gutta Percha Beltings, Tubings, Sheet for Tanks and Medical Use, Shoe Soles, Bottling Boots, Chamber Utensils, and a variety of fancy articles.

FERGUSON AND CO.,
Patentees and Manufacturers of Vulcanised Waterproofs, India Rubber, and Gutta Percha,
103, GRAFTON-ST., DUBLIN.

N.B.—A Lot of Youths' Waterproofs, 8s. 6d. each.

ASPHALTIC ROOFING FELT, a light, clean, economical, and durable roofing, price 1d. per square foot. Samples and instructions may be had gratis in answer to letters from any part addressed to MAURICE BROOKS, IRONMONGERY, GLASS, & ROOM PAPER WAREHOUSE, SACKVILLE-PLACE

The Dublin Builder.

VOL. I.—No. 12.

IRISH TRANSATLANTIC HARBOURS.

THE relative pretensions of "the Cove"—for such we must still term it—though, like others, "yielding to no man in loyalty to her Majesty"—and Galway, as a great Transatlantic seaport, have been urged with an earnestness and enthusiasm so nationally creditable—and, we may add, so nationally unusual—that, despite the political tendencies of the subject, being somewhat outside *our* province, we cannot silently permit the absorbing topic to pass without notice. Working, not talking, has characterized the respective promoters of these rival routes *ab initio*; and while the projects were deemed mere embryo possibilities throughout our kingdom, the machinery of good faith, enterprising spirit, and love for national advancement had matured them at home in a twinkling. Into all new undertakings occasional errors will creep—errors, perhaps, more the result of inability than want of foresight—and if there be a matter for regret so far, it is, that the test was not applied with sufficiently practical force to meet counteracting influences, and decide the championship definitely on the first trial. "Out of evil, however, sometimes cometh good," and, while harm is being repaired, a new field may be laid open as a stimulant to emulation in other quarters; and so it has proved in this instance. As yet the positive capabilities of Galway harbour have to be proved by a heavy outlay; she labours under disadvantages which may be lessened artificially but withal, and making just allowance for unavoidable mishaps, she has demonstrated facts in connection with this enterprize that *must* lead to great results.

With "Cove"—or Queenstown—it is different; her natural advantages, the perfect shelter afforded to vessels in severe weather by the hilly breakwaters enclosing her harbours; the facility of approach thereto under every circumstance, and the comparatively trifling outlay requisite to fit that port for transatlantic packet purposes, must bring their own weight to every mind; and her promoters, no doubt, will urge that, placing *these* in the scale with the facilities possessed by her rival, they infinitely counterbalance natural disadvantages, commanding geographical superiority. To competition the enthusiasm displayed in these projects may, to a certain extent, be traced, but now that the battle of the railways—the Midland Great Western and Great Southern and Western Companies—is fairly over, and all the points at issue amicably adjusted, it would ill become us to open up old sores or cast the apple of discord. Such is not our purpose, but *the reverse!* We believe that each may assist the other, and benefit its own interest simultaneously; for, once the principle is established that Ireland must, *de necessitate*, be the transatlantic highway, there will be opportunity enough for Cove and for Galway likewise to become important commercial depots. Whatever may result from *private* speculation towards the furtherance of these objects, there is one fact tolerably defined that little may be expected elsewhere. If the companies work hand in hand, there seems to us much greater probability of the goal being successfully reached, than should disunion and opposition prevail in the camps. We see no reason why Galway should not maintain an independent line of packets, by her Atlantic Royal Mail Steam Navigation Company, without clashing in any one respect with Cove as a port of call for the Cunard steamers. But these considerations we leave to heads more speculating than ours, for it suits us to adher to matters of fact.

The construction of the new line of railway from Cork to the harbour, the commencement of which was honoured with the prestige of his Excellency's manual assistance, "in truly workmanlike style," in turning the first sod, is a token of earnestness on the part of the Corkonians; and the proposed construction of the branch goods' line from the Broadstone Metropolitan Terminus to the shipping at the North Wall, so as to connect the English seaports direct with Galway at another side, also evidences a determination to secure a preference for the Western route. Let us hope that each are equally sincere; that no future misgivings may intercept the laudable emulation now manifested, and that to what extent energies may be taxed they will have but one end in view—viz., NATIONAL ADVANCEMENT.

Those who know the capacity of the Corkonians in matters of enterprise when once earnestly entered upon, cannot doubt but that every sinew will be strained by them towards the successful accomplishment of this end; and those who have heard—as who now has not—of the indefatigable Father Daly and the spirited Mr. Lever, will not entertain any apprehension that the capabilities of Galway will be put forward in such channels as may prove most likely to benefit the scheme, and be demonstrated by every possible practical experiment. The railway companies named above—the great arteries of traffic, South and West—will vie with each other to assist the respective projects, knowing full well that in so doing—taking the business view of the question, though allowing them some pretensions to nationality likewise—they enhance the value of their lines by a considerably augmented passenger and goods traffic. Poor as Galway may be at present, insignificant her buildings, her harbour works, &c., she can nevertheless point as an example for possibilities *in futuro* to Holyhead, which, when the new breakwater shall have been completed, may be fearlessly designated the greatest harbour in the world. But we hope to see Galway and Cove likewise more than mere packet stations *in transitu*, as they possess the elements for great commercial and naval depots *in situ*. The course now to be run, is wide enough for both ports to exert their energies in developing their respective capacities, and while the desired object is sought temperately and in the fair spirit of emulation, we repeat that the probabilities of success are *tenfold*. While writing these lines our notice is coincidently directed to an article in the last number of the *Cork Examiner*, the tone of which so singularly corresponds with our own views, that we give the following therefrom:—

> "There are, no doubt, persons who imagine that, here in Cork, we feel something like jealousy of our Galway neighbours, and that it would gratify us to find their efforts to establish transatlantic communication with their port abortive. We can assure them that no such sentiment is entertained here, and that the success of the Royal Atlantic line will be hailed with pleasure by our local community We want nothing for Cork but fair play, which we feel we did not receive from the late government. We could, however, attach no blame to Galway for her share in the transaction, and admit she was quite justified in managing as best she could, to advance her own interests. Now, that she has the subsidy, we wish her every success, and we are glad to find that the company which

is to derive the benefit of it is largely Irish, and has had so much of the Irish element infused into its directory."

As for ourselves we reserve our opinion upon the engineering topics connected with these respective projects for a future time, when matured circumstances will demand their more complete investigation.

We promise, however, that they shall receive in early numbers our impartial and special attention.

HORSE PASSENGER TRAMWAYS, AS IN AMERICA, APPLICABLE TO OUR LARGE TOWNS.

From the benefit to the public and profit to the proprietors of the American city railways, we are induced to give these statements, as the Corporations of London and Dublin opposed them, not being aware of their use and utility.

New York has five lines, about four miles long each, in operation since 1852 and 1853. At present the shares are 30 to 40 per cent. premium. In 1856 they paid dividends from 8 to 12 per cent., but as the increase in 1858 was 17 per cent. over 1856, with the same working expenses, the dividends or bonuses must be comparatively greater. From the *London Times* of 12th April, we find the number of passengers in 1858 were 27,057,802 (receipts, 1,352,887 dollars) in New York, and 7,575,828 in Brooklyn, making a total of 34,633,525; amount, 1,731,676 dollars, or £846,335; being a daily average of 94,882 persons, and of receipts of 4,744 dollars. The Dublin *Evening Mail* compared these lines, about 45 miles long, with the passenger receipts of all the Irish railways, 1,070 miles, for the same year, with the remarkable results that, at 2½d. fares, the receipts of the tramways are more than half those of the passengers of all our lines, while the number carried by them was as four to one.

Taking the Dublin and Kingstown, Cork and Passage, Waterford and Tramore lines—exclusively passenger—we find that the tramways carried eleven times the number, with nearly five times the receipts of these three railways. In Scotland, in 1855, all the railways carried 12,206,926 passengers, or less than one-half the number of the New York city lines.

The shares of the New York lines are 100 dollars, or £20 each; as the iron masters, timber merchants, car builders, and contractors took them at par, little ready money was required to complete them.

Four of them run 252 cars, have 1,857 horses, employ 826 persons, going over 4,222,855 miles per annum; starting from 2 to 10 minutes by day, and 15 to 30 minutes at night. Out of the vast number carried four were killed, the juries finding "no blame to the companies."

In the charters of some of the New York companies there was a reservation clause, to enable the city to purchase them, paying 10 per cent. over all cost; some parties are urging the corporation to do so, as they are 30 to 40 per cent. over par, but the propriety of this course is questionable though it may be legal, "*jus summum est sæpe summa malitia.*"

The Boston lines, about eight miles long, pay 10 per cent. dividends.

In Philadelphia the success has been most astonishing. The New York *Tribune*, of 27th May last, stating—"The first road went into operation sixteen months ago, eight or nine now running over 80 miles through city and suburbs, employing 250 cars, 1,600 horses, 1,000 men; most of them 200 to 300 per cent. over par. Fashionable women always shunned the omnibusses, but the ample passenger car gives room sufficient for adjusting the widest crinoline, hence all the women use them, these conveyances being filled with a different class from the omnibusses of five years ago."

It may be well here to give an extract of the *Times* on the New York rails:—"These, which are tracks laid down in the streets, are made of a peculiar form to avoid the objections to the ordinary rail, all concentrate in the business part of New York, and take most of the travel to and from it."

New Orleans—as well as many other cities—is now getting them laid, with the support of the corporations and state legislatures. In New York, in 1852, the opposition was very great, but the present state of public feeling in that city is well described by the secretary of one of the roads—viz., "As to the opposition to our road, it has entirely disappeared. During the three years I have been charged with the general business of the road, it has been steadily decreasing, and if the question of removing our rail were now mooted, almost every resident and property holder along our line would oppose it. They, on the contrary, annoy us and the other companies to extend our rails, with the view of developing and bringing into market for building purposes, lots lying outside, which would be valuable if accessible. We carry a man for 5 cents (2½d.), from his business to his home day after day, with the regularity of clock-work, and his ride in our car is as much a matter of course as his newspaper and his breakfast. On the question of the utility and advantage of city railroads, the strongest testimony we could give will be corroborated by every disinterested citizen, and they have only to be introduced in any city to be both popular and permanent."

Labour in the United States is double, and iron about 40 per cent. higher than in Great Britain, owing to the duty, freights, and other charges.

The Corporation of Limerick has been the first in Ireland to grant permission to lay them; Cork and Belfast are advocating their use, the latter city applying for a private bill. But as soon as the Irish Tramway Bill introduced by Sir Robert Ferguson, Col. French, and Col. Greville will become law, Dublin and the rest of the country will have the benefit of cheap communication; there is no measure so popular or likely to do so much good. No doubt Leeds, Manchester, Glasgow, Liverpool, Birmingham, and the other large towns, seeing the benefit New York, Philadelphia, Brooklyn, and other American cities, as well as Paris and Nantes, have derived from the horse passenger railways, will soon follow the example. The secretaries of the American companies do not act on the "no admittance except on business system," too prevalent here, but are willing to shew the advantages and profits of their lines to others, that they may benefit thereby. Mr. George Law, a prominent citizen of New York, and some years ago a candidate for the presidency, owns 9-10ths of the 8th Avenue tramway (capital, 800,000 dollars, paying in 1857 12 per cent. dividend, but now much more), and nearly all the stock of the 9th Avenue, a much longer line, running parallel with the other at a few hundred yards distance, which is now laying. The Paris lines were made by a French gentleman, long a resident of New York, who saw their benefits and profit in that city. The Nantes tramways run from the Orleans railway station to the quays, through the city, of which 1,370 yards are single, and 2,365 double lines, traversing the most crowded streets and crossing the bridges. The Dublin lines, with equipment of horses, cars, &c., and a double track, will cost about £4,000 a-mile, and single, £2,800; a mere trifle when compared with the Dublin and Kingstown Railway, of £62,000 per mile. The cars 25 feet long, 8 feet wide, and 8 high, carry 26 inside and 24 out. The one-horsed ones carrying 12 in and 12 out.

BABYLONIAN ARCHITECTURE.

An account of this style of architecture must needs be very imperfect, when the very situation of the ancient Babylon remains uncertain. This once vast city, the metropolis of one of the great empires of the world, is now but one mass of undistinguishable ruins. Herodotus gives us a very exact and lengthened description. He says the city was of a quadrangular form, four hundred and eighty stadia in circuit, divided into two districts by the river Euphrates; it was defended on all four sides by a deep trenchand wall. The wall on each side was 120 stadia in length, fifty royal cubits in thickness, and 200 in height: on the top, and on each side of it, was erected a row of houses of one story in height, facing each other, and leaving a space or roadway between them, wide enough to allow four horses to be driven along it abreast. Where the outer walls met the river, a return wall was carried along each opposite bank to fortify the city against attacks from this quarter, and behind this again another, but of smaller dimensions. In the four walls surrounding the city, were a hundred apertures or entrances closed by means of brazen gates, from each of which was continued a street to the corresponding ones on the opposite side, intersecting the roads which led from the transverse walls at right angles. Where the streets met the return wall along the banks, an opening was made down to the river, provided with brazen gates. The city was filled with houses of three and four storeys in height; and among the most remarkable buildings, were the temple of Belus and the palace, one in each of the principal divisions on either side of the Euphrates. The former is a very remarkable building on account of its supposed connection with the tower of Babel mentioned in the Mosaical account of the colonization of the earth. Herodotus gives the following description:—The tower was of a square plan, surrounded by a wall of similar form, having each of its sides two stadia in length: the sides of the structure itself were only half this length, or one stadium. He states that the tower consisted of eight tiers, which gave to it the appearance of being composed of eight towers, placed one above the other; but this in reality was not the case; such resemblance being occasioned by an inclined platform winding round outside the building, and thereby making eight revolutions: this platform formed the only means of ascent. About halfway up the incline, was a resting place, and at the highest extremity a large temple dedicated to the god Bel, or perhaps Baal: there was another chapel in this building, containing an image of the god, of which we have no particular description. Nitocris having temporarily diverted the waters of the Euphrates by a course outside the city, embanked a part of the river, and made a descent into it from each of the gates in the return wall. This embankment was constructed of baked bricks in the same manner as the walls; a different material, however, was used in the construction of a stone bridge or (perhaps we should more correctly say) piers of a bridge, as the road-way was formed of horizontal timbers, laid, as seems probable, from pier to pier. The beams were taken up at night, thus forming a kind of drawbridge. In the piers, hewn stones were employed, which were securely connected together with iron and lead. Another remarkable work of this reign, was the erection of a building over the principal gates, to be used as a place of sepulture. Let us now turn to the investigations on this subject by modern travellers, and in doing so we shall lay before our readers the account given by Mr. Rich, who has examined the ruins of this city with perhaps greater care than any other person. We must premise that the site of the ancient city is a matter of dispute, but is allowed to be situate somewhere in the neighbourhood of Hillah and Mohawill. This position has been determined upon, on account of the mounds and heaps of ruins which are found dispersed about this quarter, on or near the banks of the Euphrates. On taking a view of the ruins from south to north, the first object that attracts the attention is the low mound connected with the ruin on the south-west of the tomb of Amram: on it are two small walls close together, and only a few feet in height and breadth. This ruin, which is called Jumjuma, and formed part of a Mohammedan oratory, gives its name to a village a little to the left of it. To this succeeds the first grand mass of ruins, which is 1100 yards in length, and 800 in its greatest breadth; its figure nearly resembles that of a quadrant; its height is irregular, but the most elevated part may be about fifty or sixty feet above the level of the plain, and it has been dug into for the purpose of procuring bricks. Just below the highest part of it is a small dome in an oblong enclosure distinguished by the name of Amram Ibin Ali. On the north is a valley of 550 yards in length, the area of which is covered with tussocks of rank grass, and crossed by a line of ruins of very little elevation. To this succeeds the second grand mass of ruins, the shape of which is nearly a square of 700 yards length and breadth, and its south-west angle is connected with the north-west angle of the mounds of Amram by a ridge of considerable height, and nearly 100 yards in breadth. Not more than 200 yards from the northern extremity of this mound is a ravine, hollowed out by those who dig for bricks, in length 100 yards, and 10 feet wide by 40 or 50 deep. On one side of it a few yards of wall remain standing, the face of which is very clean and perfect, and appears to have been the front of some building. Under the foundations, at the southern end, an opening is made, which discovers a subterranean passage, floored and walled with large bricks laid in bitumen, and covered over with pieces of sandstone a yard thick and several yards long; the weight above has been so great as to have given a considerable degree of obliquity to the side walls of the passage; the opening is nearly seven feet in height, and its course is to the south. The superstructure over the passage is cemented with bitumen, other parts of the ravine with mortar, and the bricks have all writing upon them. The souterrain widens considerably as you proceed farther. This passage seems to form part of the *kasr*, or palace, and may have been perhaps the tunnel alluded to by ancient authors. The principal portion of this ruin, to which alone the term *kasr* is applied at present by the natives, is situate a little to the west of the ravine, and presents a remarkably fresh appearance. A mile to the north of the *kasr*, or palace, five miles from Hillah, and 950 yards from the river-bank, is a ruin called *Mujelibè*, meaning *the overturned;* its shape is oblong, and its height, as well as the measurements of its sides, irregular. The only ruin of any consequence to be found on the western side of the Euphrates is that which is termed by the Arabs the *Birs Nemrond*, and by the Jews *Nebuchadnezzar's Prison;* it is situate about six miles to the south-west of Hillah, and is perhaps the most remarkable of all the ruins. The Birs Nimroud is a mound of an oblong form, the total circumference of which is 762 yards. At the eastern side it is cloven by a deep furrow, and is not more than fifty or sixty feet high; but at the western side it rises in a conical figure to the elevation of 198 feet, and on its summit is a solid pile of brick, thirty-seven feet high by twenty-eight in breadth, diminishing in thickness to the top, which is broken and irregular, and rent by a large fissure extending through a third of its height. It is perforated by small square holes disposed to rhomboids. At a trifling distance, and parallel with its eastern face, is a mound not inferior to that of the kasr, in elevation, but much longer than broad; on the top of it are two *koubbes*, or oratories; round the Birs are traces of ruins to a considerable extent.—*Nicholson's Architectural Dictionary.*

We understand that Alderman James Martin, of the eminent firm of Messrs. John Martin and Sons, will be one of the aldermen to represent the Corporation at the Ballast Board after New Year's day, and that further civic honours are in store at no very distant period for this gentleman, "the noble scion of a noble house."

DOINGS AT CORK.

THE good people of Cork had some gala days last month on the occasion of the Lord Lieutenant's visit to their *ancient citie*, and right loyally and right hospitably did they welcome the representative of her Majesty, and the Dublin folk who accompanied his Excellency. Three important events came off with considerable *eclat*, and will redound to the credit and the commercial advancement of a people who yield to none in ability, acumen for business and enterprising spirit. Cork has produced some of the most eminent masters in every branch of art and science, and though many of them are now numbered with the dead, a few yet remain of whom she may justly be proud. The laying of the first stone of the new bridge across the northern branch of the river Lee, to replace the temporary structure placed there since the destruction by floods in 1853, of the old bridge, was the first ceremonial in the programme; the opening of a portion of the Cork and Youghal line *second;* and the turning of the first sod of the Cork and Queenstown railway *the third*, all of which his Excellency performed in his usual *suaviter in modo* and happy style, and to the extreme satisfaction of all beholders. We should not omit to mention that a banquet also took place, at which the "good things of this life" were discussed right jollily, and that the worthy mayor, now Sir John Arnott, M.P., was dubbed a knight. The new bridge will connect the city of Cork, by its main artery—St. Patrick-street—with the terminus of the Great Southern and Western Railway at the other side of the river, and with the important towns of Mallow, Fermoy, Middleton, Buttevant, Youghal, &c. No less than 50,000 foot passengers, and between four and five thousand vehicles of all kinds pass over this point within the space of twelve hours each day. The old bridge stood for sixty-four years, and the contractor for the new bridge, Mr. Hargreave, is the grandson of the man who built the former in 1789. The cost of the new structure will be about £16,000. It will have three arches, and be 62 feet 6 inches in breadth, with a carriage way forty feet wide, and an ample footpath at either side; it will thus be one of the widest bridges in Great Britain. The material principally employed is local white limestone, the portions only most constantly exposed to the action of the water, and those requiring to be constructed with stones of a larger size, will be of Foynes limestone; but the superstructnre will be of Cork stone. The foundations of the piers are fourteen feet below low water spring tides. For the purpose of sinking the foundations of the abutments, which was performed by Sir J. Benson, assisted by Mr. Hargrave and Mr. Barnard, excavations were made to a depth of ten feet below low water mark, and a huge iron casting was lowered down into the cavity, and the exterior and interior filled and surrounded with hard concrete. The iron casting, which weighed nearly ten tons, is of a shape adjusted to that of the piers, the interior being strengthened by transverse bars. This is packed with concrete, and the same material is filled in tightly around the exterior, so as to render it perfectly firm and solid, and capable of sustaining the superincumbent masonwork, the outside concreting bringing it up to the future bed of the river. Sir John Benson engineer; Joshua Hargrave contractor; William Barnard clerk of works.

The first sod of the Cork and Queenstown railway being turned, so far establishes the earnestness of the promoters in making this project *un fait accompli*, though without the accessory transatlantic traffic it would hardly prove a lucrative investment for a time—a question still open for decision, and likely to remain so for some time as far as the Government are concerned, if we may judge from his Excellency's diplomatic words—"it certainly affords room for speculations of far wider extent and significance, and I leave it to them to decide how far they may safely indulge their hopeful anticipations." We shall shortly revert to further doings in Cork, after an expected personal visit.

MAGEE COLLEGE, LONDONDERRY.—This beautiful edifice rapidly approaches completion. When finished, it will be one of the handsomest architectural edifices in the North of Ireland, and will reflect much credit on the designer, Mr. Gribbon, of Dublin, and on the builder, Mr. Matthew M'Clelland, who has so efficiently carried into execution the details of the plan. It is expected the building will be open in July next. The trustees, we observe, had a meeting lately, to arrange as to the laying out of the College grounds. As to the building itself, they look to the Irish Society to endow it liberally, and we have no doubt that honorable body will give due attention to the subject.—*Derry Journal.*

THE INVENTORS' ASSISTANCE COMPANY AND PATENT AGENTS.—This company, whose prospectus appears in the advertisement columns of this journal, has notified to us by special circular, to prevent misunderstanding, that, "the object of the company is simply to grant assistance to the inventor, so as to enable him to carry his designs into practice through the medium of its manufactories," &c.; and not in the capacity of patent agents, or "to infringe that branch of professional business;" and neither to purchase patents, nor lend money to patentees.

THE GOLDSMITH MEMORIAL.

The committee of this memorial have unanimously decided that the execution of the statue should be confided to Mr. J. H. Foley, R.A., an artist who, we believe, graduated in Dublin, and has acquired a well-earned reputation, by his beautiful work of "The Boy at the Stream," the equestrian statue of Lord Hardinge, and figure of "Caractacus." Mr. Foley has now a glorious opportunity of adding to his fame by a successful effect to perpetuate *faithfully* the *personnel* of "poor Goldie," whose early career was so intimately identified with the precincts of the "Alma Mater," where his effigy is now to occupy a conspicuous place.

THE CALORIC ENGINE.

These engines are largely used in the United States, for saw and planing mills, printing-presses, thrashing mills, and almost all purposes, varying from two to twenty horse power. They are easily heated, require little fuel, take up small room, any one can work them, and, having no boiler, are not liable to burst. In this country, where gas is cheap, small engines could be worked by it. In large mansions, dairys, &c., they would be found very useful. Mr. Ericson is the inventor; the patentee and agent for the United States, Mr. J. B. Kitchen, of New York.

GAS IN THE PROVINCES.

It is proposed to erect gas works at Tuam. It is said that the railway company and the town commissioners are pressing the project warmly and liberally.

Mullingar has been lighted with peat gas obtained from the material in the bogs of Rathconnell, Marlinstown, Wooddown, &c., under Mr. R. L. Johnson's patent; the first application of this valuable invention to public purposes, and said to be eminently successful.

THE ARCHITECTURAL INSTITUTE OF SCOTLAND.

We feel pleasure in directing the attention of our readers to an announcement that appears in our advertisement department from the council of management of this institute, as evidencing an earnestness in pursuit of its mission, and a practical application of the means at command to foster art education amongst the younger branches of the profession; means equally available in this country, and if turned to account by kindred societies, much good to the cause might have been effected.

Obituary.

It is our painful duty to announce the death of Mr. Mahony, artist, which took place at Cork recently, where, for some time past, he had been suffering from severe illness. Cork has lost another of her talented sons, gifted with a high order of genius as an artist. Mr. Mahony for some years past had resided in Dublin, where he held the honourable position of consul for Monte Video and Honduras, and was an associate of the Royal Hibernian Academy.

Monumental.

The friends and admirers of the late Mr. Brunel propose to determine immediately on the steps to be taken for erecting a suitable monument to his memory.

A monument is about to be raised to the late Dr. Lanigan, and the subscription list is rapidly increasing, Dr. Lanigan died in 1828, at Finglas, since which time his remains have been permitted to remain interred in the parish graveyard without even "a single rude stone to mark the place of their deposition." Dr. L. was a distinguished ecclesiastical scholar and archæologist.

The New Corn Exchange in Dundalk.—We observe the steady progress of this important building towards completion. The second roof is now being put on, and all that seems necessary to bring this undertaking to a successful issue is a vigorous effort on the part of the company. The stone used for the dressing of this structure is the same as that adopted by the Board of Public Works for the practising schools in Lower Gardiner-street, in this city; and is from the quarries of the Crowhill, Milton, and Kenmuir Company, of 51, Renfield-street, Glasgow, who are also supplying the same for alterations at Brownlow House, Lurgan.

Competitions.

THE ULSTER HALL, BELFAST.

The first prize (50*l.*) for the best plan for the building of the Ulster Hall, in Belfast, was awarded to Mr. W. J. Barre, of Newry; the second prize (25*l.*) to a London firm, Messrs. Finch, Hill, and Paraire. There were in all forty-one competitors. As a view of this building will be given in an early number, we reserve descriptive particulars to accompany illustration.

The Board of Superintendence of the gaols and bridewells, Co. Monaghan, offer a premium of £40 for the best plan to adopt the county gaol to the carrying out of the separate system. Time limited to first Monday in January.

THE SHANNON AND THE GRAND CANAL.

Canada may boast of her noble St. Lawrence, and the United States of the Mississippi; but Ireland for its superficies has a river equal to either—navigable for steamers from Lough Allen to the ocean, and connected by the Royal and Grand Canals with the metropolis and the south, and by the Erne and Ulster with Belfast, Newry, and the north. The government have expended nearly one million to improve it, and yet with almost free tolls, owing to the monopoly of the Royal and Grand Canals, under the blighting influence of the Midland Railway Company and their prohibitory rates, the finest river in the United Kingdom is comparatively useless, and the million of money thrown away. Let the Grand Canal be freed from all railway management and monopoly, and worked independently, with moderate freights, steam-tugs, and all modern improvements, and then this noble river would be the highway of Ireland, as intended by nature. Petitions against the lease of the canal to any railway must be sent to the legislature. We are glad to find the town commissioners of Ballinasloe first in the field, to be followed by Limerick, Parsonstown, Tullamore, Boyle, Carrick, and most of the towns in the west and midland districts. Poorlaw boards and all public bodies should exert themselves at once. For agricultural and mining produce, the canal is superior to the railway, which has its stations at nine or ten miles distances, while the farmers can load and unload their stuff at any part of the canal; besides their freights ought to be only one-sixth or one-fourth of that by rail. Why should the citizens of Dublin pay double the price for potatoes here, compared with the inhabitants of Carrick, Boyle, and Athlone? Both producers and consumers suffer. The Royal Canal is become a ditch under railway rule. The boat-owners and others interested in the trade of the canals and west ought to be up and stirring, the Chamber of Commerce taking a leading part, against this injurious monopoly.—*Dublin Evening Mail.*

A prospectus has been circulated of a project termed the City of Dublin and Suburbs Tramway Company, with a capital of £100,000 to establish a series of tramways in the city. We rather apprehend, though the plan may be successful in large cities like New York, no parallel can be drawn between them and a small compact city like Dublin, which only affords a feeble support to about a dozen omnibuses. At any rate, the feeling of the several governing bodies is strongly against the idea; that formerly projected to Rathmines having been opposed alike by the corporation and by the Rathmines commissioners. We think it exceedingly probable that a moderately-constructed line along the quays might be successful in relieving the streets of a good deal of heavy traffic, and we would like to see the principle tried there in the first instance.

A practicable project, and one that would become very desirable if the proposed through transmission of the mails to Cork and Galway be carried out, would be a circular railway, similar to the successful North London line in that city. For example, to commence at the Kingstown line at the Grand Canal docks, and following the course of the canal round the city to King's bridge station, then crossing the river to the Broadstone station, and forming a junction with the new line from thence to the quays.[*] A short branch to Amiens-street station and another to Harcourt-street would complete the union of all the existing lines of railway, and as peace is now to reign among them all, the cost would, by mutual co-operation, be moderate. A train could then proceed direct from the steamer at Kingstown to the steamer at Galway or Queenstown.—*Freeman.*

The idea of connecting Calcutta with London by an electric wire, is about to be realised, a portion of the cable 900 miles in length, having already reached Table Bay.

---

[*] This would appear to obviate the necessity of constructing the proposed Liffey Branch line for locomotives, as the trams could be arranged along these routes for "goods" traffic likewise.—Ed.

THE WATER SUPPLY OF DUBLIN.[*]

OUR readers are already aware that the Corporation have abandoned the whole of their plans, and are about to commence *de novo*. Five or six years have gone by since their proposition for the catchment basins in the Dublin mountains was promulgated officially, by an elaborate and expensive report printed and circulated widely. Reports have since succeeded reports; but the whole have gone to "the tomb of the Capulets," at the cost of some £1,000 or £1,200.

About £300 of this was paid to the consulting engineer, Mr. Hawksley, for a report specially recommending the plan of "the Sanitary Association," for taking the supply from the Grand and Royal Canals, which he condescendingly proposed as his own. We believe, however, as expressed in our last article, that the Corporation did not like to avail themselves of Mr. Hawksley's plagiarism; and after an attempt to amalgamate their original proposition with the canal supply, and thus avoid the wrong, it was thought better to submit to the loss of the money and the time, than to persevere in the amended project, which could not be justified.

Hence, we imagine, the cause of the present proposition. But we confess our fears that "it is only out of the frying-pan into the fire;" and if the preliminary expenses of the abandoned plans cost £1,000 or £1,200 (which is about the mark), the citizens will get off well indeed if the parliamentary and other preliminary expenses of the present plan come to less than *three times* that amount. Our full conviction also is, that the supply will be eventually drawn from the canals, notwithstanding the proposed act of parliament to take it from the Liffey. This, in fact, appears to be the *arrière pensée* of those at least who proposed the notice for the Bill; for they have introduced into it powers to treat for and take the waters of the Grand and Royal Canals. If the Liffey be so super-excellent, why legislate respecting the canals? But doubly why? when the existing Canal Acts give the directors absolute power to deal with the waters as they please, without the interference of parliament.

But how much it is to be regretted that the £1,200, now totally lost, had not been devoted to improving the present supply, by filtration and other means within easy reach, in place of seeking for another. Had a simple *charcoal* or *hair-cloth* filter been erected within each of the present reservoirs—which might have been done at the cost of some £500—the impurities now complained of would have been intercepted. *Hair-cloth* alone — a substance almost imperishable in water — would have checked, if not prevented, the ingress of that special organic matter which deposits itself within the pipes, to receive and germinate the seeds of spongelli, and to which, in fact, the complained of *taste*, &c., of the pipe-water of Dublin is due. But the bogs of Ireland could have supplied charcoal at but little cost, to perfectly purify the water of the canals, even when taken from their present impure points of supply.

We are indebted, so far back as 1849, to the Sanitary Association for the promulgation of Mr. Jasper Rogers's patented plan for "upward filtration," the principle of which has been recently brought forward at the Chemical Society by Dr. Rawdon Macnamara—and the effect cannot be doubted; but it is an Irish plan, proposed by an Irishman, and the material is "*Irish!*" Hence probably why the Corporation would not adopt it. So we shall possibly have to wait for the benefits of *upward filtration by Irish charcoal*, till some English engineer calls it *his* plan, and proposes its adoption.

We shall now endeavour to contrast the *last* plan of the Corporation with the *first* and only plan of the Sanitary Association, and nothing extenuate, nor set down aught in malice.

The Corporation propose to take their supply from the Liffey, at Coyford. The natural waters of the Liffey are exceedingly pure, and quite deserving of the very favourable analysis given by Dr. Apjohn; but it is to be recollected that that analysis is of the *natural water*, which is derived entirely from powerful springs, and which is only to be found in the river at such periods of the year as the committee and Dr. Apjohn made their surveys, and took it for analysis. It was then, in fact, a stream of spring water, scarcely to be exceeded in purity.

But let Coyford be visited, as we have recently, after some days of rain, and the water then analyzed. We found it, as for years we have known it under such circumstances, a muddy mountain stream, filled with organic impurities; and perhaps it is not far from the fact to say, that for six months of every year it is turbid and impure. Hence the imperative necessity for the vast "settling basins" recommended by the engineers, and without which the water could not be used as a source of city supply. Then come "the filtering beds of sand and gravel," several acres in extent, and, finally, "reservoirs"—for all of which, land must be purchased at a considerable cost.

Now, what are the sources of supply recommended by the Sanitary Association? 1st — Lough Owel — it may be said inexhaustible — itself a magnificent "settling basin," where almost all organic impurities are deposited before it gives its water to the canal. The canal is also a settling basin; whilst, as the water passes along the line, the atmosphere *softens* it throughout the entire course; and as it dashes down from the lock to the level below, each descent makes it still softer and purer. In this way it traverses, in easy motion, some 20 miles, leaving its impurities behind; and then (according to the proposition of the Sanitary Association) a purifying basin, similar in construction to the canal itself, within the canal boundary, and needing no Act to make the purchase, would finally receive it. There a very moderate share of scientific knowledge might divest it of any objectionable inorganic matter, if such there be; but which, in our belief, would be found to exist infinitely more in the imagination of the opposers of the proposition, than in the water itself, if taken at *Blanchardstown* on the Royal Canal, and above the 11*th Lock* on the Grand Canal.

Now, whence the source of the latter?

It is nature's purest—best—the brilliant spring which gushes up, sparkling in its brightness, till one longs to drink of it. Could we have a better proof of its fitness for our use?

St. James's Well — so called — one amongst the many springs which supply the Grand Canal, like other of Nature's munificent gifts, if not now sufficient, requires but a little help to make its own bounties alone more than so for the whole water supply of the south side of Dublin; the other supplies being more than ample for all the traffic of the canal.

---

[*] See page 141 *ante*, and previous numbers.

And as if to show the needlessness of expenditure elsewhere, in constructing reservoirs, there lies between the 11th and 12th Lock, at either side of the Grand Canal, an extent of land belonging to the company, now excavated to a depth averaging some 7 feet, and in breadth about 60 feet, extending to about 300 yards of *two miles.* This, by a little addition, could be made available, at a comparatively inconsiderable cost, as a store basin, to hold a supply of water for five or six weeks, at the maximum quantity *assumed* to be necessary for the city, but which we believe is infinitely beyond the reality.

Such a reservoir and the canal itself, extending from St. James's Well to the 11th Lock, a distance of about 15 miles, we need scarcely say, would present more than ample space for the settlement of organic impurities; and within the reservoir a filtering chamber, such as we have named, would, we believe, readily accomplish perfect filtration.

Thus it would appear that so far as sources of supply, and means for settlement and purification of the water, the canals possess the superiority, vastly, over the Liffey.

In our humble judgment, it would be about as wise to insist that we should purchase our porter from the vat in fermentation, and bring it home to fine and settle in our cellars in vats provided by ourselves, as to take the turbid waters of a mountain river, to be made pure by settling basins, and filtering beds, and reservoirs, contrived at some enormous cost; whilst water, originally pure and wholesome, deposited in settling basins already provided, and needing but the simplest filtration to rid it of inorganic impurity, is offered to us almost at our doors. And with this conviction, we would hope that before further expense be gone to, the whole question will be reconsidered.

In our next publication we hope to give estimates of the cost of each proposition, and such details as will enable our readers fully to judge for themselves. We cannot but feel that the Corporation, as a body, has been placed in a very awkward position, by naturally relying on propositions coming from their constituted authorities, which have proved erroneous.

Unhappily, when the steps taken by the Sanitary Association brought out facts which opened the eyes of some members of the Corporation, the question was made a party one, and the direct recommendation, subsequently, of the consulting engineer, to adopt the canals, was, as it would appear, considered to be a full acknowledgment that the Sanitary Association was right and the Corporation wrong. This was certainly hurting—*amour propre* was offended; and—just like what we see in individuals and public bodies every day—although knowing themselves to be wrong, they would not admit it. It is, we believe, our nature, which is much to be regretted. If we could only, in this case, as in all others, calmly investigate and ascertain what are the real facts, and admit them whatever they be, it would, we think, be the wisest and best course.

In proof of our sincere desire "to practise what we preach," we throw open our columns to all who may desire to show that we are wrong in anything we have written on the subject; and if we be, we shall honestly admit our error, and make all amends within our power.

We said in our last article on the subject, that the public owe a deep debt of gratitude to Dr. Gray and Mr. Codd, for saving them from the infliction of the catchment basin plan. We believe that as regards cost it would have been a public waste of money; as regards purity and extent of supply, a thorough failure; and as regards science, a public discredit. When those gentlemen took up the question they had much to contend against. They found on record the reports of their own and their consulting engineer, unequivocally stating that, under all circumstances, the supply from the canals was the best that could be adopted. They, of course, knew the feelings of the Corporation as to the Sanitary Association plan, and still their better judgment made them condemn the catchment basins. What could they do? The directors of the canals solved the problem. They refused to be bound under heavy pecuniary penalties to supply to the city of Dublin ten million gallons of water daily, *whether it pleased Providence to grant that supply or not*; for that was the literal meaning and wording of the demand of the Corporation.

The directors could not assume a power beyond that of mortals at the bidding of the corporate authorities; and as they did not, the door was opened, out through which Dr. Gray and Mr. Codd most cleverly led the whole Corporation. That body, therefore, as well as the public, owes them deep gratitude. But somehow we have the feeling that the public will still be more indebted to those gentlemen. We have the *presentiment* they will yet be satisfied that the canals *have* the power to give an ample supply to the city; and if the directors but prove that fact, as we believe they can, we do not for a moment doubt that either Dr. Gray or Mr. Codd, *if convinced on that point*, would for one instant hesitate to support, in place of oppose, that source of supply. Men of really independent minds fear not to allow themselves to be convinced, and thus do honour to their independence and probity.

AMERICAN NOTIONS OF WHAT STEAMSHIPS MAY YET ACCOMPLISH.

A PUBLIC lecturer, at Buffalo, by name Germain, stated, that seeing the steamer Oregon plying on the Sound, he felt convinced that her superior velocity was not due to superior steam power, but to her model—and that 19 or 20 miles an hour was not the maximum of velocity to be obtained; that the only limit of velocity was the principles of steadiness and strength—and that limit could not be fixed at 50, 60 or even 100 miles an hour. Therefore economy should follow velocity, when velocity was the result of this cause.

He made long and elaborate calculations, and numerous drawings; consulted with experienced engineers, steamboat and vessel captains, and all commenced the examination with the greatest incredulity, but they found in the designs a corroboration of their own experience, and all have come to his conclusion in reference to the practicability.

He stated that a steamer can be constructed that can run over *one hundred miles an hour*, and so strong, that the oceanic forces cannot destroy her equilibrium or peril her safety. The economy of movement also, will be such, that that which would cost for the same power and strength *one dollar*, in this would cost but *twenty cents.* She would not draw more than twenty feet—a draught less than the Great Eastern when light—and could carry a large amount of freight and passengers, with coal enough to bring her around the world. He then exhibited diagrams by which he explained the decrease of resistances of bodies moving in fluids, in the ratio of the square of the sine of the angle of inclination. The great resisting force to bodies moving at high velocities is *friction*—in low velocities, *inertia*—and the amount of these forces is not known. Fish overcome friction, not only with their smooth covering, but with a perfect lubrication. Birds also spread over their bodies an oleaginous substance, to overcome this force in the air. The great Architect in this exhibited the importance of smooth surfaces in bodies that attain rapid velocities. By making vessels smooth and polished, we also, in a measure, overcome the friction to be met with under other circumstances."

HINTS FOR WORKMEN.

The faults of well-paid workmen are not deficient industry, but excessive, or at least irregular, exertion. When liberally paid by the piece, they are tempted to overwork themselves, and to ruin their health and constitution in a few years. This is the case of porters, coal-heavers, and many common labourers in London, Dublin, and elsewhere. A carpenter is not supposed to last in his utmost vigour above eight years (?). The double wages paid to country labourers during harvest, or to tailors during a general mourning, are frequent sources of permanent injury, from the inducement they offer to over-exertion. Almost every class of artificers is subject to some peculiar diseases, occasioned by excessive application to their peculiar species of work. Ramuzzini, an Italian physician, and Thackrah, an English surgeon, have written treatises concerning such diseases. Excessive application during one part of the week is frequently the cause of the idleness complained of during the remainder. "Great labour," Dr. Smith remarks, "either of mind or body, continued for several days together, is in most men naturally followed by a great desire for relaxation, which, if not restrained by force or some strong necessity, is almost irresistible. It is the call of nature, which requires to be relieved by some indulgence," or change of occupation. Relaxation does not always imply idleness, but, as Locke expresses it, "easing the wearied part," by exchange of employment. If not complied with, the consequences are often dangerous, and sometimes fatal; and such as almost always bring on, sooner or later, the infirmity of the trade. If masters would be more humane, and journeymen more reasonable, both would see the utility of temperate exertions of industry. The man who works so moderately as to be able to work constantly, not only preserves his health the longest, but, in the course of the year, executes the greatest quantity of work. Labour, without reasonable intervals of rest for meals and relaxation, exhausts the energies of both body and mind, and is of the two more hurtful than low wages, which abridge diet and physical comforts.

Mr. Thackrah, to whom I have just alluded, from his residence in Leeds—which is literally one great manufactory, subdivided into various departments of industry, places of refreshment, abodes varying in their comforts, according as the occupiers are masters, overseers, or workmen—has had favourable opportunities for observing not only the effect of different occupations on the human constitution, but also of different degrees of exertion. Some of this gentleman's conclusions in his work on *The Effects of Arts, Trades, and Professions*, are contrary to what might have been anticipated. For instance, wet, vapour, and changes in the humidity of the local atmosphere, appear not so detrimental to health as is generally supposed; in temperate persons these agents produce little injury. Sudden transitions from heat to cold, as experienced by smiths, iron-founders, and glass-men, are not productive of acute disorders. The exhalations from vegetable matter are not found uniformly injurious; but on this point the writer declines giving a decided opinion. The natural odours of manufactured vegetables, with the exception of coffee, are little noxious. Tobacco workers do not sensibly suffer from the fumes of their material; and the crushers of rape and mustard benefit by the odours which these seeds exhale. Members of parliament and persons of fashion will be gratified to learn that the influence of change in the hours of sleep is less than might be expected: millers, watchmen, and coachmen are not sensibly affected by night-work. Horses, however, suffer from nocturnal labour, and men, too, I apprehend, unless the change, by perseverance, has been made habitual.

Some agents or circumstances connected with employment are favourable to health. Such are the animal exhalations to which slaughtermen, butchers, poulterers, fishmongers, gluemakers, buckram-stiffeners, tanners, tallow-chandlers, curriers, and grooms are exposed. Oil or grease applied to the skin is a preservative, as experienced in slubbing, carding, and pieceuing, in the woollen manufacture.

The chief agents included under the denomination of deleterious, or unfavourable to health and longevity, are excess or deficiency of food, bent-sitting posture, long standing or sitting, great muscular efforts in lifting weights, steam, artificial heat, impure air, dust and gaseous impurity of the atmosphere, anxiety and mental application, and delay of micturition, compression of the chest, bending of the head for long periods, close application to minute objects, as in watchmakers, engravers, tambourworkers, and dressmakers; poisonous substances acting through the skin, as lead, printers' type, and mercury; or on the eyes or ears, as scarlet-colour, lime-dust, and the noise of machinery.

One satisfactory result may, I think, be safely deduced from the inquiries of Mr. Thackrah—namely, that there is hardly any employment which is not compatible with the enjoyment of tolerable health, when exercised subject to the three following conditions:—1. Moderate hours of labour, according to the greater or less exhausting nature of the employment; 2. Temperate, wholesome, and regular living; 3. Reasonable meal-times, and holidays occasionally, for purer air and exercise.

Next to keeping up the price of labour and the preservation of health, a cardinal point with the working classes is to establish and maintain a high standard of comfort and enjoyment in their habitations, clothing, and food; to eschew whatever brings them to the verge of existence, to their last resources in diet, dress, and lodging; and as casualties of health and fluctuations in employment are inseparable from every occupation, a provision should always be made, if possible, for slackness, sickness, old age, and infirmity.

It is a disadvantage to the industrious orders that they cannot more easily adjust the supply of labour to the demand. When wages are depressed by competition for work, they are compelled to submit to coarser and scantier fare; and the danger is, that a mode of life at first repugnant to their feelings, and forced on them by necessity, may become habitual. Should this be the case, it is not likely they will make an effort to check the over-supply of labour which has caused their degradation; and as a lower rate of wages is found sufficient for their maintenance, an evil that might have been temporary is made permanent.

Labour, like gold and silver, can be made valuable by its scarcity only, and no other contrivance. All the acts of legislation, all the combinations and devices among workmen themselves, must fail in rising to a high price that which is redundant, which every where abounds, and which may be indefinitely, and by any one produced: we might as well seek to give a value to water or the atmosphere that surrounds us. A scarcity of the employed, and abundance of employers—a population that follows, and not precedes, the augmentation of national wealth, is the great secret of popular amelioration. Without this, the advantages of increasing opulence, civilization, and commerce, can never be participated in by the working classes; social improvements, in every shape, may advance over the land, but it will never touch the low and stagnant pool in which they are immersed.

As the high price of labour produced by scarcity of workmen is the fortress that protects all their comforts and conveniences, they ought never to yield an inch of the "vantage ground" without dire necessity. The remarks of Mr. M'Culloch on this point are dictated by sense and humanity, and well worthy of attention. "The example," says he, "of such individuals, or bodies of individuals, as submit quietly to have their wages reduced, and who are content if they get only the mere necessaries of life, ought never to be held up for public imitation. On the contrary, every thing should be done to make such apathy esteemed disgraceful. The best interests of society require that the rate of wages should be elevated as high as possible—that a taste for the comforts, luxuries, and enjoyments of human life should be widely diffused, and, if possible, interwoven with national habits and prejudices. Very low wages, by rendering it impossible for any increased exertions to obtain any considerable increase of comforts and enjoyments, effectually hinders them from being made, and is, of all others, the most powerful cause of that idleness and apathy, that contents itself with what can barely continue animal existence."—*Principles of Political Economy*, second edition, p. 394.

The father of economical science had inculcated the same philanthropic doctrine. "Is this improvement," asks Smith, "in the circumstances of the lower ranks of the people to be regarded as an advantage, or as an inconveniency to society? The answer seems at first abundantly plain. Servants, labourers, and workmen of different kinds, make up the far greater part of every great political society. But what improves the circumstances of the greater part can never be regarded as an inconveniency to the whole. No society can surely be flourishing and happy of which the far greater part of the members are poor and miserable. It is but equity, besides, that they who feed, clothe, and lodge the whole body of the people, should have such a share of the produce of their own labour as to be themselves tolerably well fed, clothed, and lodged."—*Wealth of Nations*, b. i., ch. 8.

Government is interested not less than the people in the diffusion of such sentiments. It can never be the pride of authority to rule over an ignorant, ill-fed, and degraded population. The diffusion of political power has assimilated society to the nature of a joint-stock association, in which the rulers and ruled have a common interest. Government cannot be rich while the body of the community is indigent; it cannot be safe, while that on which it mainly rests cannot be depended on for support. It is not the opulent who demand legislative attention; they are exempt from want, and as they assume to be educated, they ought to be exempt from crime; they form that part of the social waste which has been reclaimed and cultivated; but the poor, if not still in the wilderness, are only on its verge, and require to be brought forward by the application of those practical truths I have endeavoured to explain and enforce.*

OUR SECOND YEAR!

THE PROPRIETOR TO HIS PATRONS.

Few who plunge into the Rubicon of newspaper speculation ever attain the opposite bank in safety; so rapid is the current of *distrust*, and tempestuous the sea of *opposition* to be contended with. Those so favoured must, therefore, *doubly* appreciate the encouraging kindness of all, who, "throwing oil on the troubled waters," and contributing the wherewith to float them freely on their perilous voyage, enable them successfully to accomplish a task originally deemed impracticable. Such *was*, and such *is* now our position; and we cannot allow the *first year* of our vitality to pass without thanking our patrons—*which we do most heartily*—for the substantial aid afforded, without also submitting a brief *resume* of past proceedings, and saying a few words respecting our intentions for the future. In starting this journal—after the premature cessation of previous similar attempts—we had more than ordinary distrust to combat; but nothing daunted by untoward circumstances, and bracing up all our energies for a determined push, we have, with your co-operation, succeeded in establishing one fact, which, however, *we* never doubted—viz., *that there is not only ample room, but positive necessity for a journal in Ireland devoted to Architectural, Engineering, Building, and kindred pursuits.* We preferred rather to creep at first, and feel our way cautiously, than to embark in too much; but we point with some degree of satisfaction to the manifest and progressive improvement in each succeeding number of the present volume.

In evidence of the success attending past operations we may state, that although our subscribers' list was unusually important during the first three months, IT HAS SINCE DOUBLED; our advertisements have TREBLED IN VALUE, and with our fourth—the May—number we were necessitated to ENLARGE the journal by ONE HALF—viz., 8 pages. If our anticipations be correct, we *expect* that with an early number we shall be enabled again TO ENLARGE FURTHER from the present 24 PAGES to 32 PAGES, exactly double the original size. "THE DUBLIN BUILDER" is largely and steadily patronized in the advertising department by some of the most eminent hardware, cement, and fire-clay manufacturers, machinists, &c., &c., in both England and Scotland (as may be noticed by reference to our advertising pages), and our subscribers' list embraces, with very few exceptions, all the Architects, Civil Engineers, Surveyors, Builders, Clerks of Works, Foremen, Mechanics, &c.; likewise Reading-rooms, Hotels, Mechanics' Institutes in every town in Ireland, very many throughout the United Kingdom, and in the Colonies; the Officials in the War Departments of London, Chatham, Aldershot, the Curragh, Glasgow, Dublin, &c., &c. In addition to these, our free list embraces numerous firms in the manufacturing towns of Glasgow, Paisley, Leeds, Bradford, Bolton, Manchester, Liverpool, Sheffield, Stafford, the Potteries, Birmingham, Wolverhampton, Bristol, &c., &c., thereby securing an extensive and choice circulation not obtained by any periodical out of London.

On the 1st January, 1860, we commence a new era, and "THE DUBLIN BUILDER" shall appear as an ILLUSTRATED JOURNAL (a course which, from prudential motives, we refrained from *this* year), for which purpose blocks, with a variety of subjects thereon, are at present in our engravers' hands, and will be produced in a style commensurate with the *resources* at command. Lithographs will also be occasionally substituted for woodcuts, and irrespective of the copies thereof circulated with the journal, proofs on superior paper, and suitable for framing, will always be obtainable from our Publisher. To meet the expense attendant on these arrangements we have resolved *slightly* to increase the price, to which, no doubt, in consideration of the greatly-increased advantages derivable, all will approve and gladly accede.

The Proprietor hopes shortly to wait on *all* his subscribers in the metropolis and the chief provincial towns, as also on his local and English and Scotch advertising patrons, with a view of personally acknowledging *past* kindness and further enlisting their support.

Meantime his Publisher shall thankfully receive at the Office orders for, and amounts of, renewal subscriptions—PROMPT *commands being respectfully requested.*

RATHFARNHAM.

This village, in the environs of our metropolis, so celebrated for its pure air and mountain scenery, and formerly the residence of most of Dublin's gentry, is again retrieving the position it lost by the rapid rise of Kingstown neighbourhood. A new episcopal church and schools are in progress in the parish, and a road from these buildings to Willbrook, passing Rathfarnham village, is contemplated, with a bridge over the Dodder, already noticed. The new Scots church of Rathgar will be in this parish, and an intended Catholic church is likewise spoken of. New residences are being built, and older ones improved; conspicuous amongst the latter is Fonthill Abbey, formerly Willbrook House, the property of Mr. E. P. Gribbon, architect, and government surveyor, who has considerably enlarged and improved the building, raising the tower, and adding a carriage porch to the front, rebuilding a postern, and improving the gate entrance and offices, &c. The house forms a pleasing feature in the landscape. The new road, if made, would pass through Lord Justice Blackburn's demesne, and render part available for building ground, but without cutting up this demesne; likewise another road might be made by following the river bank from the proposed new bridge to Willbrook chapel, avoiding Rathfarnham Hill and village, and opening up the neighbourhood; and Sir Robert Shaw might run a new road across the end of Bushy Park from Rathfarnham, to meet this and present desirable villa lots. Another great improvement would be a good modern road or avenue direct from Willbrook to Dundrum, starting above Willbrook village across the end of Mr. Gribbon's ground from the Ballyboden-road, and crossing Whitechurch-road and the Grange-road, it would keep clear of Mr. Hodgens' park and of the convent, and passing Nutgrove-school, two miles of villa sites to Dundrum would be obtained, and a branch railway or tramway might in time be added; Rathgar-road also could run on across the Dodder and intersect with this Dundrum-road.

OUR MONSTER HOUSES.

Tenders are being received for further additions and improvements to the monster warehouse of Messrs. Todd, Burns and Co., according to plans prepared by Mr. E. P. Gribbon, architect. Messrs. Cannock, White and Co. are still adding to their premises, every inch of available room being apparently eagerly caught at; Mr. Anthony, architect; Mr. Wm. Hughes, builder. The façade recently erected by Messrs. Pim, Brothers and Co., South Great George's-street, after designs by Mr. Symes, architect, and excellently executed in the plastering department—which is very elaborate and consistently ornamental without being too pretentious—by Messrs. Hogan and Son, is a handsome addition to the locality, and might fairly stand the test of comparison with the architecture of many warehouses in cities of greater commercial importance. Enemies to the monster house system must in justice admit that, as far as the building profession is concerned, there is some truth in the proverb "it's an ill wind that blows nobody good."

PRESBYTERIAN CHURCH, ORMOND-QUAY.

This building being found too small for its increasing congregation, Mr. E. P. Gribbon, the architect, who designed and superintended its erection, is making plans for additions, by removing the schoolhouse at the rere in Strand-street; and for altering the internal arrangements.

ARCHITECTURAL PHOTOGRAPHIC ASSOCIATION.

On the 23rd ultimo this body held a special general meeting at their rooms, Conduit-street. Mr. Haywood moved the adoption of the report, and Mr. Lockyer seconded it. Mr. W. Lightly was appointed honorary secretary in the room of Mr. R. Hesketh, resigned, whose valuable services the Association deeply regretted. There will be no exhibition of photographs this year. Another special general meeting will be held to receive the report of the Committee of Inquiry into the accounts and present position of the association.

FIRE ! PRECAUTION AGAINST ACCIDENTS.

The recent fatal occurrence in Mary's-lane, in this city, as well as the many others elsewhere from time to time, furnishes a salutary lesson to those engaged in house building, of which however, though at the cost of the lives of their fellow creatures, they seem ill-disposed to take advantage. Our architects, in designing buildings, usually pay strict attention to internal accommodation, external effect, aspect, sanitary arrangements, &c., &c. ; but not *one* out of one *hundred* ever thinks of guarding the lives of the intended occupants against the possible outbreak of "fire," so fearful in its consequences. Sooner or later—surely *too late* in many instances !—the authorities *must* make a move in this matter ; why *not at once ?* why not peremptorily insist that the plans of all proposed structures of a commercial and domestic class especially—and however insignificant—should be subjected, under penalty, to the inspection of a competent surveyor, whose chief duty would be to see that a facile means of egress be provided in case of fire. In various cases this could be effected most inexpensively, and *in all* for an outlay that would be amply reimbursed by the security afforded, and the pleasurable reflection of saving even *one* life annually. Hereafter the applicability of precautions under *any* and *every* circumstance shall form a subject for special treatment in our columns.

AIR-TIGHT DOORS AND WINDOWS.

Many of the fatal maladies "to which flesh is heir," are traceable originally to colds ; and "colds" again in *their* turn are almost invariably to be attributed to incautious or unavoidable exposure to draughts of air, damp clothes, &c. In the latter instance, prevention is not always as easily obtainable as in the former ; for, by a very simple and comparatively inexpensive invention, doors and windows "through which the wind whistles," causing a draught terrible and treacherous, may be made perfectly air-tight in their joints and arises. Badly-executed carpentry work, and fresh timber employed in doors and windows, soon develop their defects, and a proprietor discovers that his building which has *pretty well lightened his purse*, is not habitable by those whose constitutions will not stand proof against perpetual perishing and sharp cutting draughts playing about their persons. Being recently invited to inspect a model of Mr. Greenwood's patent india-rubber stops and slides, at the establishment of the patentee's sole agents, Messrs. Ferguson and Co., 103, Grafton-street, and, having examined it, we can testify to its effecting perfectly the desired purpose. Though we should much prefer that our readers would personally inspect the model, and judge for themselves, we may, for those unable to do so, add that the invention consists simply of a narrow vulcanized india-rubber slip, fixed angularly in a moveable beading, to be screwed and hinged to the door or window frame or casing, so as to press closely to the door or sash when shut, and prevent the possible ingress of air or dust. To French casements—so unusually constructed water or air-tight—this invention appears peculiarly applicable. Self-acting slides, either in oak or mahogany, with brass plates and springs, are likewise applied to the bottoms of doors, and make the saddles perfectly air-tight. The invention must, from its importance and simplicity, command extensive adaptation.

RESPONSIBILITIES OF ARCHITECTS.

The new Town Hall at Folkestone, which we had an opportunity of inspecting some months ago, is an attractive looking building, but being discovered to be insecure in its construction, the Town Council have ordered that the architect, at his *own expense*, shall deliver up the ground very nearly as he found it—viz., that the side walls are to come down to the sills, the back wall altogether, and new walls with foundations ten feet deep—and three instead of two bricks in thickness—to be substituted. We learn from the *Building News* that "the architect has been under the painful necessity of tendering his resignation."

Church-road.—In addition to the domestic dwellings already noticed as in course of erection for Mr. Philip Brady in this locality, Mr. Bollands, an English resident, is about building six cottages on his property adjoining Wharf-road. Mr. Lyons, architect.

"STRING" *VERSUS* "CALLIPER."

The *vexata quæstio* of the day appears to be timber measurement ; the memories of the strike have been consigned to oblivion, or have dwindled into comparative nothingness, in the face of the controversy recently commenced, by the advocates of the *string* versus the *calliperites*, and which has already assumed proportions which savour strongly of the ever-memorable "big endian heresy of Blefescu." As *we* may be considered impartial observers between the belligerents, we flatter ourselves our remarks may in some measure tend to smooth differences between the contending parties.

It has always been the custom in this market to purchase timber by string measure, which, to the uninitiated, requires some explanation. String measure consists in girthing the log in the centre, and multiplying a fourth of this dimension by the length, which gives the cubical contents ; this mode is generally correct, but it is not so in all instances, as may easily be proved by trying it with unequal-sided logs ; but as these form the exception, and not the rule, string measure has been invariably adopted in Dublin, both by importers and purchasers as the heretofore best mode of sale.

We are no sticklers for antiquated customs, because they happen to be in use for time immemorial, nevertheless we freely acknowledge "string" measurement as open to little disputation, as we shall presently show.

Timber importers never purchase by string measure. In America the sales to them are by calliper, and in Europe by the running foot ; freights are charged to them by the same mode, and duty exclusively by calliper. As the objection to calliper measurement applies chiefly to American wood, they not unreasonably suppose their customers should suffer the same inconvenience as they do themselves.

Shipowners charge by calliper because an unsquared log takes up as much room in the hold of a ship as a squared one. The Government charge duty by calliper, because, in the first place, it involves by far a less amount of trouble in measuring—which is almost invariably done while the timber is in rafts upon the water, and easily adjusted to the calliper, whereas it would be extremely difficult, nay, almost impossible to girth it—in the second place, because they are not unwilling to make the most of the duty.

If all imported timber arrived in the market squared, it occurs to us that calliper measurement would afford the nearest possible mode of ascertaining the contents with accuracy ; but as only Memel, Dantzic, and European red woods, with American oak, are fully squared, we think builders and retailers of timber have much reason in their preference for the string. Pine, both red and white, birch and mahogany, are never squared, or so partially so, as to be designated what is technically called "wany"—that is, they are of much less dimension on the outsides than in the centre ; so that in sawing up the timber, the outer planks vary very considerably in depth from the central ones, often as much as from four to six inches. With these descriptions of timber, how can the calliper give the correct contents ? Timber of this description measured by calliper in contra-distinction to string should be sold at a reduction in price, varying according to circumstances which, in many cases, may amount to a difference of from ten to twenty per cent.

Impartially speaking, the change in measurement contemplated by importers would appear to arise wholly or in part from the great competition of the present day. Merchants are naturally anxious to spare themselves trouble, and save the additional cost of remeasuring, which amounts to nearly an additional shilling per ton, and which must eventually fall on the consumer. But the remedy, if such be required, lies in the purchasers' own hands. By far the greater amount of timber sold is purchased at the periodical auction sales, and here the builder and retailer can act as he sees fit. If the importer insists upon selling unsquared logs by calliper, we see no reason why he should not do so, no more than a builder should insist upon making a contract according to his own views. Here the judgment of the purchaser is at once called into requisition, and we will not so far libel him as to say he cannot bid according to the average squareness of the lots offered, and how much easier is it for the small consumer to purchase his single log, according as it may be squared or unsquared.

We freely give place in the present number to all the correspondence which has appeared on this subject in the local journals, anxious that *both* sides of the question may be calmly and fairly considered. In giving our own views we admit it is more for the purpose of inviting discussion than of eliminating opinions in opposition to our own preconceived ideas.

The following is the correspondence alluded to as having taken place in the local journals, and which probably may be assumed to represent the tone of feeling at present entertained by the respective bodies on the question at issue:—

SIR—I see by this morning's *Saunders's News-Letter* a resolution was passed at the "Monthly Council Meeting of the Builders' Association" disapproving of the mode of measuring timber by calliper. The proper mode of measuring timber is one of great importance to all consumers of it, and some years ago the government adopted calliper measure as the best mode for levying the duty upon it. Contracts for freight are made for the same measurement, and the government have adopted a system of check on the measurement by a superior officer remeasuring about every tenth piece of wood, which is calculated to insure accuracy. In every market in Ireland, that I am acquainted with, calliper measure is that used in selling to the consumer, excepting in the city of Dublin, where the old system of string measure was retained for the local trade. Now, the importer of 1,000 tons of timber pays duty and freight by calliper measure, he pays nothing for obtaining this measurement save the trifling expense of keeping a smart boy to attend the custom-house officer, and make up his book of numbers, lengths, squares, and contents, as called out by the officer as each piece of wood is measured. On the contrary, if he sells by string measure, he has, when the cargo is landed, to get it remeasured, at a cost of about one shilling per ton, including porterage, thus increasing his cost of landing 1,000 tons by a sum of £50, which, of course, the consumer has to pay. It is said that there is more wood in a ton of timber by string measure than by calliper; if so, the selling price will be higher, as if a cargo of 1,000 tons calliper measure turn out only 900 tons string measure, the seller must have as much for the 900 tons of one measure as the 1,000 tons of the other, plus the cost of remeasurement. The advocates of string measure say there is a gain of 10 per cent. by that mode, but I never got an importer yet to guarantee me over 5 or 6 per cent., whilst they always asked 8 or 10 per cent. more money, and on remeasure I found the usual difference to be about 4 or 5 per cent. Parts of feet in the contents are charged in string measure, and no parts of feet are charged on sales by Queen's calliper measure. It is obvious to anyone who reflects on the subject, that calliper measure is the best mode to obtain the cubic contents of timber, and let all timber be properly squared. There is no doubt that if an importer of timber has to pay one shilling per ton for remeasuring his cargo, he will charge this indirectly to the buyer, and that if his 1,000 tons calliper measure timber should, on remeasure by string, turn out only 900 or 950 tons, that he must get the larger price for the smaller number of tons than for the greater. The true question, then, for the consumers of timber in Dublin is, whether they will take timber by calliper measure or continue to pay one shilling per ton for its remeasure by string.—I am, sir,

A LARGE BUYER OF TIMBER IN THE DUBLIN MARKET.

SIR—Having read a letter on the subject of the measurement of balk timber, in your paper, signed "A Large Buyer," &c., and believing that the statements contained therein are incorrect and calculated to mislead the public, I wish to make a few observations in reply. From time immemorial, the uniform rule of the trade in the port of Dublin was, and is, to take the girth of each log in the centre with a string, and to multiply the length by one-fourth of this girth to ascertain the true cubic contents. A very slight amount of consideration is required to see that this is the fair and honest mode, and charges the purchaser with only what he actually receives. The measurement, by calliper, which is an instrument made to register the largest width and depth of a log, would be honest, if all the timber imported had been sent over die square; but such is very far from being the case; every piece is more or less round, and the calliper taking the breadths and depths, charges the purchaser with what would have been the contents had the timber been truly squared to the largest dimensions From the above considerations, it is evident that calliper measure, along with being unjust, can never be steady or uniform, but must vary in proportion as the several logs are square or round. It is only those who pay particular attention to the return of the timber they cut up who can form any adequate judgment of the injury inflicted by calliper measurement; and, therefore, I think I am safe in hazarding the opinion that the person styling himself "A Large Timber Buyer," must be one whose large purchases little affect himself, and have not to be cut up for building or retail purposes. In any case, his statement that the difference between calliper and string measurement is only from 4 to 5 per cent. differs greatly from my experience for fully 20 years. I have found that the difference, even in the best squared timber, amounts to from 6 to 8 per cent., while on badly squared logs it amounts to from 25 to 30 per cent. As to the cost of measuring the timber properly, surely it is better for the purchaser to pay even a shilling per ton more than to pay for one-eighth or one-fourth greater measurement than he receives. Further—the government measurer generally takes the measurement while the timber is in the water, where no allowance can be made for defect or unsoundness; nor is there any responsible person to act as measurer between the buyer and seller The fact mentioned, that the government has adopted calliper measurement as the best mode of levying duty proves nothing as to its justice. They found it the best and easiest way they could devise for charging a large amount of duty, and string measurement was impossible when much had to be measured in the water. I should also mention that in Liverpool, where the largest timber trade is carried on, string measurement is the rule, and liberal allowances made for defects. It seems strange that any merchant would think it wise to run counter to the wish of the whole local trade. The builders have already published their opinions and intentions, and the retail timber merchants and cabinetmakers are about to have a meeting of their trades to protest against this innovation. So universal is the disapprobation expressed by every branch of the timber dealers, that it is hoped the established rule will remain undisturbed; but should this hope fail, the public and the trade may rest assured that there is sufficient private enterprise and public spirit to prevent the beneficial rules and customs of this port being at the mercy of any parties who would change them to suit their own convenience.—I am, sir,

A BUILDER.

SIR—"A Builder" has replied to my letter, which appeared in your paper a few days ago, but he has not attempted to overturn a single statement contained in it. He simply confines himself to general assertions, based in his experience of 20 years, and a general denial of some of my statements as to the gain on measurement between string and caliper measure. I reiterate my assertion, that I never got a seller of timber to guarantee me more than 5 or 6 per cent. gain, and that I usually found it to be from 4 to 5 per cent. I shall by a few lines make my former letter a perfect "Reading made Easy." An importer of 1,000 tons of crown Memel, calliper measure, can sell his cargo at say £4 per ton (£4,000). If buyers require to have this timber by string measure, the importer has to get it remeasured at a cost of say 1s. per ton, and the measurer returns him by string measure a quantity of tons less than calliper measure. I shall assume this to be 950 tons. The importer stands thus—he can sell his cargo of 1,000 tons calliper measure for £4 per ton—£4,000. He has 950 tons of string measure, to obtain which result he had to pay £47 10s.; and in order to obtain his £4,000 for the cargo of timber, and to be re-couped his £47 10s. paid for remeasure, he must get £4 5s. 2d. 10-19ths per ton, string measure. Having now shown the commercial advantage to the consumer of buying timber by calliper measure, let me show the correctness of the calliper for ascertaining the cubic contents of a log of timber. "A Builder" says, "A very slight amount of consideration is required to see that string measure is the fair and honest mode, and charges the purchaser with only what he receives." Notwithstanding "A Builder's" assertions and experience of "fully 20 years," I must say that measuring timber by calliper, when fairly squared, is mathematically correct, and that measuring by string is mathematically incorrect when timber is not equal sided. For instance, a log of 40 feet long, 12 inches by 18 inches, contains 60 cubic feet, the one-fourth of the girth of such piece gives 15 inches, called the square by the "Builder's" indispensable measurer, and gives a result of 62½ cubic feet. This incorrectness must always exist where timber is unequal sided and measured by string. "A Builder's" experience may be very large, but his consideration of the true mode of measurement of timber is very small indeed. As to the "Builder's" statement about the measurer by string making allowance for defects and unsoundness, I maintain this allowance should be made in price as well as where timber is defective in square. The intelligence of buyers and sellers can readily adjust this without the intervention of a third party at the cost of 1s. per ton. I do trust that calliper measure, as the just and true, will soon be the only measure for timber known in any market; and any old-fashioned buyers of timber wishing to pay for its remeasure by string, at a cost of 1s. per ton, and a nominally higher price for it, will, no doubt, find plenty of intelligent sellers to meet their views, but they will take care to have the same amount of money for the wood as if it was sold by calliper measure.—I am, sir,

A LARGE BUYER, &c.

SIR—With the greatest deference to "A Builder's" experience of 20 years in the measurement of timber, I do not think the difference between string and calliper so great as he states, and I am quite sure the change, if accepted in a proper spirit, will be found to work fairly for merchant, builder, and retailer. Though my experience does not extend beyond seven years, I can safely say that very few persons have had more experience of the two modes of measurement, or more opportunities of ascertaining the difference between them. The result of that experience enables me to say, that on timber in general the difference between string and calliper averages 7½ per cent.; on well-squared timber it does not exceed 4 per cent., and in no case does it exceed 15 per cent. It is very easy to test the accuracy of the "Builder's" experience with mine, and I am quite satisfied the result of such a test would be to establish the truth of my statements. Taking the extreme case of timber badly squared, and where the difference is greatest, is not the "Builder" aware that the merchant selling by calliper measure takes the difference into consideration, and regulates his price accordingly? If the sale of timber by calliper measure be so disadvantageous to builders and retailers as "A Builder" states, how is it that the builders and retailers of Belfast, Cork, Waterford, and Limerick tolerate calliper measure, though no other is used in these ports?—and I think he can hardly say they are less deficient in public spirit and attention to their own interests than their Dublin brethren. I submit that their experience of calliper measure has shown them the advantage of it, and that the favourers of it in the Dublin market are entitled to the thanks of the trade and public in establishing one uniform mode of measurement for timber throughout Ireland. Travellers in petty German States are annoyed with the different systems of coinage in each, and I think the Irish public have no reason to be pleased with the system that allows one mode of measurement in Cork and Belfast and another in Dublin.—I am, sir,

ONE IN THE TRADE.

SIR—In reply to the letters on this subject, signed "One of the Trade," and "A Large Buyer," both of which call in question my statement in a former letter—viz., that the difference between string and calliper measure amounts from 6 to 8 per cent. on fairly-squared cargoes, while on badly-squared ones it reaches from 25 to 30 per cent. I am sure it will please both the builders and the retail trade to have an early opportunity of submitting the question to the best opinion in Ireland on the subject. There is advertised an auction of a cargo of timber, to take place on the 1st of December, on Sir John's quay. Mr. Barcroft is to be the broker and measurer (thereby proclaiming that all the trade are not going to be bound down by one firm). No one in Ireland has had so great experience, having measured nearly all the timber coming into this port for more than 30 years, and his straightforward conduct has gained for him the confidence of the trade. Let them, "The Large Buyer," or "One of the Trade," ask him to state publicly what has been his experience of the difference between string and calliper measure, if they dare to put their assertions to so fair a test. Neither of the answerers to my letter have tried to prove that calliper measurement does not charge the purchaser with a greater quantity than he receives, and is therefore dishonest. Nor have my statements as to variability and want of check been controverted. Since my first letter I have had frequent opportunities of ascertaining the opinions of the leading and independent members of the trade, who are unanimous in their disapproval of the change, and indignant that an attempt should thus be made by any one party to tyrannise over the whole. In fact, to such a pitch has this feeling arisen, that several have determined to import, and, even though late in the season, some cargoes may be expected, which will be sold and measured according to the established rule of the port, and orders have been forwarded for the earliest cargoes possible in spring.

A BUILDER.

The Amsterdam Crystal Palace is to be completed and opened in the year 1861; it will be 400 feet in length by 200 feet in width, and the central dome will be 200 feet in height, at the junction of which will be a transept, and the nave of the edifice. The structure is to be of iron and glass; but as Holland is not famous for iron, it will be supplied by England.

Correspondence.

SIR—With regard to the latter portion of "An Architect's Thoughts in Belfast," in page 145 of the DUBLIN BUILDER, permit me to suggest that it contains subjects for the three following observations:—

I have not visited Belfast, and do not know whether the porticoes of the public buildings of that city and of its neighbourhood "are anything but creditable to architectural taste" as matters of *design*. On reading the next sentence of the original, it would seem to me that they are creditable designs, but discreditable in your correspondent's opinion because built of brick and plaster; for he says that "they should be altogether omitted if the funds will not admit of their being executed creditably in cut stone." Here is an exhibition of a fallacy which I should have hoped had been confined to England. It is one of Mr. Ruskin's pet theories, and it only requires this answer—If brick and plaster will do the work required cheaper than, and as efficiently as, stone, what is there in the materials that vilifies the design? Your correspondent seems to hold the opinion (which is not held by the most uncivilized races, but has been reserved for Mr. Ruskin and the Ecclesiologist) that the value of the *design* is enhanced by the cost of the *material*. Every architect ought to know that a plaster cast from his decorations in stone might be quite as beautiful as the original. A wax model for a silver candelabrum is not necessarily more beautiful than its first cast in plaster of Paris. Would your correspondent think a gold or a silver column more beautiful than a stone one?

I am not aware that "this part of the structure" (the portico) "is designed solely for effect, and to afford pleasure to the mind of the beholder;" on the contrary, I always imagined that porticoes, which had a visible service, had a charm beyond that of a mere exhibition of means of procuring a broken surface, light and shade, &c., and I do not believe that all the porticoes in Belfast and its neighbourhood are useless. But even if these porticoes are all useless, what is there to justify your correspondent's assertion, that "they have very little either of taste or discrimination who expect that brick and plaster columns or porticoes will ever" afford pleasure to the mind of the beholder. Here again is a Ruskinian theory, that what has originally been done in one material should always be of the same for the future—*i.e.*, there should never be columns of metal or of brick. But as plaster is *stone* worked by a particular treatment, is it not really within the Ruskinian limits? and as the marbles, &c., are stones originating from varied treatment, which is the one to be adopted as a standard? and further, as nature does not make stone columns, what taste is there in working them otherwise than of basalt blocks? The pleasure to the reasonable beholder of a portico does not arise from construction in stone, but from skill in the composition and details. Bricks are sham stones; why, then, does not your correspondent attack the present system so popular in England, of building in brickwork of varied colours, or in brickwork at all. Lately the Ecclesiologist (I think) did not object to plastering if it were not scored to imitate the joints of stonework. If this authority be right, your correspondent cannot justly find fault with the plastered column for representing to the uneducated eye a monolith.

The connection of the last paragraph ("It is to be hoped," &c.) with the subject here treated does not occur to me, unless your correspondent, thinking that the question of plastering is one of taste, wishes to brand as "inefficient men" all those who are not of his (self-confessed) crude opinion. I beg you to say that, with all deference to his capabilities of forming an opinion, I humbly conceive the foregoing points may be much more forcibly urged; indeed so much so as to convert him to a sense of their truth, and that it is to be regretted that "crude" thoughts should be handed to a periodical and therein get a place, which, if they were not refuted, give them an air of authority. People cannot pass their lives in looking everywhere for these errors. With best wishes for the success of the DUBLIN BUILDER, I am

AN OCCASIONAL READER OF ITS CORRESPONDENCE.

London.

DOES ARCHITECTURE IN DUBLIN IMPROVE?

SIR—Recognizing the "DUBLIN BUILDER" as a careful exponent of architectural progress, and feeling an interest, perhaps acknowledging it as "a hobby," though not being identified with such pursuits professionally—I trust you will courteously permit insertion of the following crude remarks. I am sufficiently national to admit, that Dublin may pride herself on her beautiful buildings, but "the proverb becomes somewhat stale" when we reflect, that her chief architectural boasts are the works of those long since laid under the sod—"upon whose like we ne'er shall look again." If we except the Four Courts, Custom-house, Bank, and Inns—without advancing an opinion too confidently—it appears to me that her recommendations are "but few and far between," and that since the period of the erection of those named, architectural taste—at least such as has been substantially exemplified—has considerably *digressed* instead of *progressed*. I should deem it unbecoming to use your columns as a medium to criticize individually the works of *ye* modern architects, who doubtless are your warmest supporters, and that personal offence may not be taken to my remarks, I prefer treating the subject *generally*. In the matter of local ecclesiastical art, I must in justice admit that "ye Gothicists and Mediævalists" take the lead in attractiveness and imposing grandeur; but, Sir, though a modern Gothic edifice may display fair proportions, commodious arrangements, elaborately traceried windows and doors, decorated pinnacles and gables, &c., so many venerable subjects have been provided by ancient architects for the modern to graft on, and so voluminous are the models placed at command in standard works, that a modern architect—at least the disciples of the system observed here—can claim little merit for their adaptation to circumstances. The proverb, "there is nothing new under the sun," seems to hold good here, for the most costly Gothic edifices in our city display few features that may not be traced to the stereotyped forms with which an architectural eye becomes familiar, in visiting various towns in the United Kingdom, and on the European continent. A little less rigidity, absence of sticklerism, for reproducing the works of *masters*, and a little more boldness and originality of treatment would, to my mind, effect a most desirable revolution in *our* ecclesiastical architecture. Turning to the miscellaneous buildings now in progress or recently completed, we have little to congratulate the memory of Chambers and other masters upon the paltry adjuncts made—by way of improvement, no doubt—to their venerable realized conceptions, which ornamented our city in no small degree.

In official departments, I apprehend from what I learn, that the mysteries of red tapism are carried to such an extent as to ignore the development of national ability, and advance favourites at the public expense. Be this as it may behind the curtain, I only advance my opinion on what I see amongst the audience—and seeing is believing - viz., that there is lack of architectural taste and suitability to existing works in some public buildings now erecting and lately finished in Dublin. Where, however, novelty of style, details and materials have been adopted by other gentlemen, who have rightly cast aside the monotonous hum-drum features prevalent, I trust the result as anticipated may prove successful, though I have some doubt that the new *regimé* prescribed will for a while prove palatable to the million.

Our commercial and domestic architecture—though efforts are made occasionally in the former—to rebuild dilapidated premises, or doctor them up with patched and tawdry ornamentation, they are indeed but *efforts* generally; and some newly-erected suburban residences aping Gothicism, Orientalism, but effecting barbarism most successfully, are objects of ridicule to every man of taste. The greatest building of antiquity which I had the happiness of traversing from foundations to summit—viz., St. Peter's, at Rome, suffered materially in its parts by change of architects—a necessary consequence, however, owing to the magnitude of the work, occupying the ages of generations to execute—and to this fact, at home, may be attributed, I presume, the mongrel productions as displayed in some of our largest commercial-house fronts.

The most eminent ancient masters were such imitators of nature that they introduced the lotus, the acanthus, and various other plants into the decorative parts of their buildings; likewise heads, wreaths, grotesque figures, &c., &c., which were both consistent, and contributed, where judiciously employed, much to the general effect: but, may I ask, sir, is there any consistency or propriety in "ye modern architects," by way of novelty, introducing plaster *spitoons* into their friezes and model *cramp plates* as substitutes for pilaster caps? The above are plainly my crude reasons for considering that architecture in Dublin does *not* improve, and are respectfully advanced by

ONE WHO LOVES THE ART FOR ITS OWN SAKE.

JUVENILE ART EDUCATION.

SIR—Can anything be more palpably defective than the condition of our *ree-raw* home-grown young architects generally when their term of probation expires? Paterfamilias naturally desires to give his sons professions, and if one juvenile displays an ingenuity in raising mock fortifications, steam-engines, bridges, &c., he is marked out for an engineer; or if another's hand seems freely adapted to building sketches, and his taste to lie amongst "bricks and mortar," the promising youth is taught to foresee the path of a Wren or an Inigo Jones "looming in the distance," and is destined to be dubbed "an architect." Now, architects require *smart fees* with their pupils, and a five years' apprenticeship, but do they, as a body, fulfil the engagement of the indentures—viz., "to teach and instruct said apprentice in the same art which he useth, by the best way and means that he can"? If they did, there would not be such a scarcity of competent assistants, who, unless imported from England, are not to be had for love or money; and young architects (?) just turned out have imbibed during their apprenticeships so much of the mannerisms and peculiarities of their masters, that they prove next to useless when put to fresh work. Some of your readers will probably advance, "there is the Royal Dublin Society school, where Gandon and others graduated who afterwards proved ornaments to their profession, and why should not the same source of instruction prove sufficient for the present generation? The Royal Dublin Society School, no doubt, possesses the elements for instruction in *copyism*, and some very excellent specimens and models for students; but *practical* instruction, such as may hereafter assist a lad in weathering the storm through life, is as deficient here as it is in the generality of architects' offices, where graduates are left to shift for themselves, and *find* out instinctively what it is clearly the duty of their masters to *teach* them. In one of your contemporaries, I think the *Building News*, I noticed some time since an excellent article on an "architectural college;" and though the scheme, however desirable, is quite inapplicable to the resources of this country at present, I think the suggestions might advantageously be carried out forthwith on a smaller scale. An academy for graduates directed by competent professors, whose experience embraces various styles, and wherein a good fundamental preparatory education should be afforded, would seem not only to prove a desideratum to the pupils themselves, but to the masters likewise, who could be saved the drudgery of initiation.

Subscriber.

Sir—Lest an erroneous impression should be conveyed to your readers by the notice kindly accorded in November number to *Wilme's hand-book for mapping, engineering, and architectural drawing*, viz., that early application for copies is *indispensable*; permit me to state that the re-issue will *not* be made before *January* next, due notice of which shall be given by advertisements in your Dublin Builder, and the other professional papers,

London. B. P. Wilme.

Notes of New Works.

METROPOLITAN.

Important alterations and improvements have been made to the establishment of Mr. A. F. Macdonald, in South George's-street, which may be fairly regarded as one of the monster houses. Mr. J. Quin was the contractor for the first section of the works, and Mr. R. Farrell for the latter portion; architect, Mr. E. P. Gribbon.

The necessary buildings for a timber steaming apparatus are about to be erected and fitted with boiler, &c., in connection with the new graving dock at North Wall point, after plans, &c., by Mr. George Halpin, C.E., engineer to Ballast Board; Mr. Bindon Stoney, C.E., assistant engineer.

Considerable additions are being made to the new steam mills of Andrew Todd and Co., at Clonliffe Bridge, on the Royal Canal. Mr. S. H. Bolton is contractor for the present works, which have been carried on with great spirit. The mills were erected about twelve months ago by Messrs. Cockburn and Sons, contractors, at a cost of about £15,000, They are in line with the new brewery of Messrs. Findlater and Co., the canal passing between, and approaching them by the canal are seen to good effect. Messrs. Beardwood were the builders of the brewery; and both buildings, including the present additions, were erected under the inspection of Mr. E. P. Gribbon, architect.

Extensive improvements and alterations have been just completed for Mr. Berry, Arran-quay, from designs by Mr. J. J. Butler, architect; William Hughes, builder.

The builder's work of Mr. Robert Gatchell's new premises in Dawson-street (previously noticed as having been commenced), is now complete, and the establishment about being opened. This structure is an elegant and effective acquisition to the commercial architecture of the city. The works were executed by Mr. J. Quin, builder, from the plans and under the directions of Mr. Gribbon, architect.

The new range of law courts and offices of the judges of the Landed Estates are nearly completed, and will be ready for occupation by the first day of Hilary Term next. There shall be two courts in the new buildings, which are to run rectangularly to the range just completed—viz., a Court of Probate, and a third Landed Estates Court. The buildings about to be opened are fire-proof throughout. In the basement storey are receptacles for documents, records, &c., and on the ground floor are suites of spacious, well-lighted, and well-ventilated offices. A grand staircase, lighted by a glass dome, conducts to the second floor, where the new courts are. The courts are dome lighted, and the stucco work is elegant in design and execution. They were planned by the architect to the Board of Public Works; Mr. Meade, builder.

Plans have been prepared by Mr. E. P. Gribbon, architect, for erecting warehouses and sheds on Sir John Rogerson's-quay, for C. Connolly, Esq.

The cost of effecting the necessary rebuilding of the store belonging to the City of Dublin Steam Packet Company, at the North Wall, will be £400, covered by insurance.

A new house for law chambers has been erected on the premises No. 2, Lower Ormond-quay, for M. Dooner, Esq. Architect, Mr. E. P. Gribbon; builder, Mr. T. Murphy.

Messrs. T. Heiton and Co., coal and iron merchants, are about roofing over another of their coal yards on Georges-quay, under the inspection of their architect, Mr. E. P. Gribbon; Mr. Thomas Paul, contractor.

Messrs. S. Vincent and Son are about rebuilding the front portion of their extensive foundry in Church-street, and forming large show-rooms for patterns and castings, &c.. Same architect; Mr. Bolton. builder.

The new monster establishment for ironmongery, plate glass, cements, and builders' furnishing, &c., of Mr. Maurice Brooks, at Sackville-place, was until recently the large factory of Dawson and Co., coach builders, which has been remodelled under the direction of Mr. E. P. Gribbon, architect. The coach yard roofed over and floored, &c., forming the central apartment, larger than an ordinary church.

THE SUBURBS.

Tenders have been sent in for the erection of a baptist church at Rathmines, from designs by Messrs. Carmichael and Jones; the contractor has not yet been declared.

The new Presbyterian congregation of Rathgar (who now occupy at a rental the building formerly Rathmines school-house) are about to erect a new church and schools in this rising neighbourhood, for which their architect, Mr. E. P. Gribbon, is preparing the plans.

Building works still proceed with rapidity within the boundaries of the Rathmines Commissioners, and on through Rathgar and Rathfarnham parish; passing the omnibus station, an elegant villa has recently been raised by Mr. W. Vincent, facing Sir Robert Shaw's demesne, with a beautiful unique gate-lodge and handsome terrace. Mr. E. P. Gribbon, architect; the builder, Mr. T. Robinson.

PROVINCIAL.

At Bray, Co. Dublin, a terrace of twelve dwelling houses of a very superior class, and with oriel windows to each, carried up the full height, is being erected on the beach by Mr. Brennan, Mr. Gregory Murphy, builder; and close by, the semi-detached cottages called "*Wave Crest*," recently erected by Mr. Anthony O'Neill, are to be raised an additional storey, under the direction of Mr. Lyons, architect.

Extensive additions are being made to Portmahon House, Co. Dublin, the residence of Mr. A. M'Donald. Mr. E. P. Gribbon, architect; Mr. Robert Farrell, builder.

The foundation stone of a new convent has been laid at Bantry, Co. Cork.

Loans for the erection of "farm buildings," under the Landed Property Improvement Act, have been applied for to the Board of Public works by Mr. John Blakeney (£627), and Mr. F. A. Knox Gore (£800), in the respective counties of Galway and Mayo.

We learn from the *Western Star* that the Earl of Clancarty has expressed his intention of advancing money, at a moderate rate of interest, to approved tenants, for building a range of villas between the workhouse of Ballinasloe and the railway station. The tenant may choose his own architect and contractor. The project seems to be a most desirable one, for the town is cabable of much improvement. Mr. Madden, a local builder, has built some cottages in Upper Dunlo that are an acquisition, and owns an excellent limestone quarry there. Mr. T. H. Carroll, of Baggot-street, Dublin, has likewise another quarry, yielding superior building material.

Additions are to be made to the handsome railway station in this town. Mr. George Wilkinson, architect, Mr. Madden, builder, who was declared contractor in a limited competition with Messrs. W. Crowe and J. W. Carroll.

An excellent building in limestone is being erected at the Stephen-street gateway of the Clonmel Infantry Barracks, by the Messrs. Corcoran, contractors. It is intended for the purpose of a sergeant's messroom.

The building at the Brow of the Hill, Londonderry, in which the Christian Brothers reside, was paid for by the clergymen of the diocese; and the new schools close to the Catholic Church, Great James's-streeet, cost £1,000. In Strabane, the Christian Brothers have an excellent school, in a building purchased for them by the Catholics of that town at a considerable cost. Great exertions have been made at Omagh to provide school accommodation, and one benevolent individual has given a sum equal to £1,000 towards expenses; also ground for the schools, a parochial house, and other buildings required for the use of the parish.

The foundation stone of a new church at Ballymote, Co. Sligo, has been laid.

A handsome porch and additional offices are being erected at the county Tipperary Infirmary, Cashel, by Mr. J. Fitzgerald, contractor; when finished the new buildings will be a decided improvement.

The church of Tamlaght Finlagan, at Ballykelly, Co. Derry, is to be enlarged, according to plans. &c., by the Ecclesiastical Commissioners' architect.

The War Department are about having a school-room erected at Athlone Barracks, and redoubts constructed on Carrig and Scattery islands on the River Shannon.

The new Scots' church at Athlone is nearly completed, and is said to be much admired; it will probably be opened for service before Christmas. The architect is Mr. Gribbon, of Dublin; the builder, Mr. Smith, of Athlone

The stable buildings destroyed by fire at the Palace, Armagh, are to be immediately restored, under the direction of Mr. W. J. Barre, architect, Newry.

It is proposed to erect a new Roman Catholic church at Castlebar.

A new glebe house is to be built in the parish of Timahoe, diocese of Leighlin, Queen's County.

The Saintfield Gas Company have advertised for tenders to erect the iron work portion of their new buildings.

A new Roman Catholic church is about to be erected at Knockbridge.

A further addition is being made to Breslin's Marine Hotel, Bray, under the direction of Mr. G. Wilkinson, architect.

The foundation stone of the new Roman Catholic Church at Ballybay has been laid. The building itself, which is to occupy a very conspicuous situation, will consist of a tower on south elevation, through which will be the principal entrance; a handsome porch on north side, and transepts on north and south elevations, lighted by tall double lancet windows with quatrefoil above. The chancel is to include the entire of the transepts, in which will be two handsome side chapels, lighted with elaborately traceried windows; and that occupied by the grand altar will be approached through a majestic chancel arch, and will contain sedilia, piscina, sacrarium, &c., and be lighted by a triple lancet window on the east, and a single lancet on the south. The west elevation will contain a triple lancet of great height and beauty, and a double lancet on the north aisles, both aisles being lighted by double lancets in the pointed style, as is the nave. All the opes, doorways, and windows are of cut stone. The principal doorway through the tower is richly and elaborately moulded. The outer walls and the walls of the tower are supported by cut stone buttresses, as are all the gables. The interior of the roof of the chancel and side chapels is to be handsomely pannelled, the nave and side aisles to have the timber exposed and neatly stained. The church is in the early Gothic style. Mr. William Hague, Cavan, designed it, and Mr. George Burnett superintends the working out.

Monthly Railway Memoranda.

A new line of railway is proposed from Athenry to Ennis by a point of junction with the Midland Great Western Railway at the former place, terminating at the latter with the Ennis station of the Limerick and Ennis Railway.

It is proposed to vest the several existing works and property of the Waterford and Limerick Railway in the Great Southern and Western, and to dissolve the former company.

A new line of railway from Kells to Oldcastle is contemplated. The Dublin and Drogheda Railway Company have consented to give 55,000*l.* towards the undertaking, and the Drogheda Steam Packet Company 25,000*l.* The entire sum calculated upon as sufficient to complete the line to Oldcastle is 80,000*l.*

It is proposed to construct a line of rail at the St. Johnston Station of Derry and Enniskillen Railway, running close by the towns of Raphoe and Manor Cunningham, within three miles of Convoy, and terminating in Letterkenny town, the distance of which from Derry is 23 statute miles. Mr. Peter W. Barlow, F.R.S., the consulting engineer, and Mr. Bower, V.P. Institution Civil Engineers in Ireland, the acting.

The Finn valley line is proposed to start from Ballybofey, and passing through the towns of Stranorlar, Killygordon, and Castlefin, to form a junction with the Derry and Enniskillen rail at Strabane station. Mr. Barlow, engineer in chief; Mr. Bower, resident engineer.

A direct railway route is proposed from Cork to Limerick by a junction with the Great Southern and Western Station at Charleville, and 16¾ miles in length. It will have a short branch from Foynes line into Limerick at Patrick's Well, and have an independent terminus. Sir John Benson, C.E.; The Earls of Dunraven and Cork; Hon. Major Vereker, Sirs David Roche, John Arnott, M.P., Cusack Roney, W. B. Hackett, and a number of influential gentlemen, are on the list of provisional directors.

The Cork and Youghal Railway has been opened, and trains are now running thereon.

RAILWAYS IN IRELAND.—At the recent banquet to his Excellency, at Cork, Sir Edwd. M'Donnell stated "that nearly £15,500,000 had been expended on the 1,200 miles of railway now in existence in Ireland, and that while £15,000 per mile was the average expenditure in this country, it was £20,000 in Scotland and £39,000 in England. Also that the dividends for Irish railways averaged 4½ per cent., while the English were only 3¼."

The terminus at the Downpatrick end of the Belfast and County Down Railway is nearly completed, and said to be a handsome building, reflecting much credit on the architect. The interior is at present undergoing the process of painting, and in a couple or three weeks it is expected to be open to the public.

BALLINASLOE AND PARSONSTOWN RAILWAY.—We are glad to be able to announce that the formation of a company to construct this line is in active progress, and that a prospectus will appear in the course of a few days. When this connecting link is made, Waterford will be within four hours of Galway.—*Western Star.*

ATHENRY AND TUAM RAILWAY.—The ground about our docks has during the last month or better been crowded with materials for the construction of the above railway. The huge piles of timber imported for sleepers, &c., have been already conveyed to their destination, and now immense quantities of rails are in readiness for removal to Athenry.

Reviews.

British Timber Trees. By John Blenkarn, Agricultural Engineer. Post octavo, half bound. Routledge, Warne and Routledge, Farringdon-street, London.

AN important work deserves more than the passing notice—which owing to its arrival at the eleventh hour—we were only enabled to give this book in last publication. A glance, however, sometimes proves sufficient to convince of the merits of a composition, and we are gratified to announce that on investigating the contents more minutely, our favourable opinion—hazarded we may say—is fully justified. The cultivation of timber in these countries has been from time immemorial so sadly neglected—with the single exception of British oak, in the rearing of which also there is much room for improvement—that we are compelled to send to foreign countries for the very *material* of our carpentry and joiner's work, though possessing at home the facility for producing an article equivalent in value, if we only *took the trouble* to rear it.

The author, in his preface, truthfully says, "It frequently happens that proprietors of large estates have not the slightest idea of the value of timber growing upon them; and by preconceived notions incorrectly formed, noblemen and other great land owners whose time is otherwise much occupied, seldom give but little attention to what they consider to be the minor concerns of their estates; many indeed being in the habit of regarding timber merely as an ornamental accessory, little supposing that possibly it may be worth more *than half of the property*, as estimated on the basis of the rental;" further that "An acre of oak woodland containing 100 loads of timber (which is a very low estimate) is worth £650 at a moderate computation, and fifty acres of such property would thereupon yield £32,500 worth of timber."

Mr. Blenkarn is clearly a practical man, and eminently so; his work embraces timber from its germination to the felling, and the respective quality and adaptability of each kind in ordinary use, concluding with valuation and measurement, tables and rules, simply set forth but evidently founded on reliable data, such only as experience can afford. In his notice of the "horse-chestnut tree," which the author states is little inferior to the oak in durability, he takes occasion to mention that "the late Welby Pugin was often at considerable pains to make out this wood when he found it in roofs and joinery, and in many of the engravings in his works both of English and foreign buildings it will be found distinguished by having the name 'chestnut' written upon it."

In treating of the improvement of "hilly and mountainous districts," we must express a regret that the author—though alluding to England and Scotland—should have passed over Ireland in toto, where probably the services of the practical agricultural engineer is comparatively even more needed, and where the extensive perusal amongst landowners of this truly practical little work would prove a national desideratum. But we must assume that it did not come within the sphere of his experience! *Quel dommage*, say we! The author has faithfully fulfilled his mission, and his work must command extensive appreciation.

Skyring's Builders', Contractors', and Manufacturers' Diary for 1860.

In acknowledging the receipt of this book, we can speak of its merits with the confidence that experience always gives, having had that for 1859 on our office table during this year, and finding it most conveniently arranged for memoranda of appointments, payments, receipts; besides having an almanack, postal regulations, building memoranda in the various departments, forms of agreements, tables showing prime cost of deals, planks, and battens, the Metropolitan Building Act, &c., &c. It will be found useful to the professional as well as the tradesman.

A Handy Book on Villa Architecture.. By C. Wickes, Architect. London: Thompson & Co., 111, Strand, W.C.

The arrival of this work at the last moment, when preparing for press, precludes comment as to its merits in current No.: but the name of the author is so favourably known to the profession, that we doubt not after opportunity for examination shall have been afforded us, we shall be enabled—as on former occasions—to pronounce an approving opinion. *Au revoir!*

We may take occasion respectfully to mention that it would be desirable if London and other publishers, forwarding works for review, would bear in mind, that we go to press at farthest on the 29th or 30th of each month, and that a clear week before would be the *minimum* period to command a careful perusal.

Miscellaneous.

Royal Dublin Society and Affiliated Bodies.—The opening meeting of the session took place on the 25th ultimo. Surgeon Fleming occupied the chair in the Council Room, and Drs. M'Donnell and Walker read papers respectively on "The Habits and Anatomy of the Lepidosiren Annecteus" and on "The Phenomena connected with the existence of Fresh Water Ice in the Arctic Seas." Mr. Pollard Urquhart, M.P., occupied the chair in the Statistical Society's room, where Mr. Conway Dobbs read a communication entitled "Observations on Mr. Caird's pamphlet on Prairie Farming in the United States;" and Dr. Hancock a paper on "The Bothy system of lodging Farm Labourers in Scotland." The Photographic Society was held as usual in the Fine Arts Gallery: Captain Henry, V.P., in the chair, and Sir Jocelyn Coghill, Bart., read a paper on "The Relation between Photography and the Fine Arts," and exhibited some excellent illustrative pictures. The several societies then adjourned to discuss the "tea and cakes."

The Breakwater in Galway.—Mr. Percy, who is about to accept the contract for constructing the proposed works in the harbour, arrived in town accompanied by some other gentlemen, and held a conference with Father Daly and S. U. Roberts, C.E., on the subject of the intended improvements. Mr. Percy also contemplates the laying down of a line of rail from Ennis direct to Galway, to be continued on to the end of the pier to be constructed in our harbour. It will be a convenience of paramount importance to have a railway reaching thus to the side of the packet. And as steam communication between Ennis and Galway, directly or indirectly, must prove of vast benefit to this town and to the transatlantic line, we earnestly hope some arrangement may be made between the two parties interested in uniting this town by rail with Ennis through Athenry, and those who are in favour of a more direct communication with Galway.

Telegraphs to the East and Australia.—The line is complete to Aden; from Aden to Kurrachee the line is contracted for, and the cable ready for laying down in the next month. This will complete the line to Calcutta—or rather to Rangoon—for the telegraph has been for some time at work between the two last-named places. From Rangoon (proceeding south), the Indian government have already engaged to complete the line down the west side of the Malay peninsula, by Tennasserim and Penang to Singapore, and thence by Banca Island to Batavia. The Dutch Government, too, has a line at work along the whole length of Java to its east end, Cape Sedana, to which point electric communication may be said to be provided for. It is proposed to proceed from the east end of Java in an easterly course to Copang, in the Island of Timor, thence to Port Essington, thence to Cape York, thence down the Australian coast to Cleveland Bay, and thence further to Moreton Bay. There the line will terminate, and very properly so, for there is no doubt that long before the above grand scheme can be carried out the New South Wales and Moreton Bay governments will have established intercolonial communication. The whole distance from Java to Moreton Bay is calculated at 3,024 miles, and the estimated cost, which seems based on reliable data, is £720,000, or to be on the safe side, £750,000. The construction of an electric telegraph between Russia and China appears to be assuming a character of reality, and nothing now seems likely to interfere with the accomplishment of a plan which will give to China and to Europe the marvellous means of instantaneous communication.

The New Club in Dublin.—We hear that a handsome and commodious house has been taken for the new club that is now forming in this city. We are informed that it will be conducted upon a system of liberality that will ensure every possible comfort, and that the entrance-fee and yearly subscription are so reasonable as to at once do away with exclusiveness. There are new features in this club which cannot fail to recommend it to notice, particularly to country gentlemen. There will be sleeping accommodation and a social house dinner for a stated number of members at a convenient hour daily.—*Communicated to Freeman.*

Japanese Baths and Bathers.—The bath house is situate in a narrow street, running from a main street, a short distance from the custom house. We entered a low porch, first putting aside a hanging screening of matting, and passed into a spacious room divided into three compartments. On the right was a dark division with benches around for resting or smoking upon. A youth sat upon a small table with a cash-box before him, for the receipt of bath money; the price for each bath being five copper cash. On the left the apartment retired far back, the floor gradually inclining downwards for about six feet, and again ascended towards a screen, behind which some good people were enjoying the luxury of a warm bath. A channel passes through the room to carry off the water. Near the screened apartment, but exposed to public view, was a broad and shallow bath of cold water in the angle of the double inclined floor, and here *men*, *women*, and *children* squatted down, on issuing from the hot bath, and splashed the *cold water over their bodies;* they use it unsparingly. Nothing abashed by the presence of strangers, the work is carried on vigorously; and the exhibition is looked upon by the Japanese in every respect consistent: it may be from an Adam-and-Eve like simplicity on their part. We, with our artificial habits and customs, are astonished at the primeval simplicity of the Japanese, and would imagine that such exposures would have a demoralizing influence. The bath is a capital studio for artists and anatomists, admirers of faultless forms or muscular development, and affords a good opportunity of inspecting stature. On leaving the bath, they scrub themselves dry with coarse towels, then dress, and leave the establishment, or retire to a small room, where they can be provided with a refreshing cup of tea.

County Hall for Mullingar.—At a recent meeting of the committee of the Westmeath Farmers' Club, the president, W. J. Levinge, Esq., stated that he had been in communication with Col. Greville, M.P., relative to an agricultural hall, and he was happy to inform them that he had evinced the warmest interest in the project. A public library, a reading and a ball-room, might form part of the structure. Col. Greville, who was now a member of the club, had fully agreed in the view that the building should be for more general purposes than an agricultural hall only, and had most kindly promised to consider the whole subject, in order that everything might be done to meet the wishes of the county as far as possible.—*Westmeath Guardian.*

THE DRAMA.

Of such artistes as Mr. and Mrs Charles Kean, whose transcendent talents have placed them at the highest pinnacle of professional fame, a critique is unnecessary; and we, in common with our press brethren, can only record in our pages on their behalf another of those triumphs in histrionic display at our Theatre Royal, of which their career may be said to present a continuous and uninterrupted series. Amongst the novelties introduced to a Dublin audience was the tragedy of Louis XI., in which the acting of Mr. and Mrs Kean may be said briefly to be "perfection." The accessary parts in this, as well as the others embraced in the *repertoire*, were creditably sustained, and the scenery and appointments excellent.

The Queen's Theatre still maintains its well-earned success under the existing management, which avails itself of every available source to produce novelty and attraction. We are informed that the pantomime season close at hand will bring to light some embryo treasures for our young folk, and develop some strange hilaric incentives. In the scenic department pantomimes furnish a good field for artistic ability, let us hope that it will be guided by consistency as well as effect.

BANKRUPT BUILDERS.

John Quin, Upper Stephen-street, in the city of Dublin.
C. M. Stephens, of Wexford-street, in the same city.

NOTICE.

Orders for Subscriptions to, and Advertisements for, The Dublin Builder, *will be received at the Proprietor's Office,* 17, Lower Gardiner-street. *Wholesale Agents*—Messrs. W. H. Samuel Hall, Esq., 19, King's Arms Yard, Moorgate-street, City.
(Ex-Director and Chairman of the Midland Counties Railway.)
Adam Stoker Mather, Esq., Hollingworth-street, Barnsbury.
Stephen Hawes Crosswell, Esq., 86, St. James's-street, Picadilly.
(With power to add to their number.)

Bankers—Messrs. Ransom, Bouverie, and Co., Pall Mall East.

Solicitors—Messrs. Bell, Cowdell, and Boyce, 21, Abchurch-lane, City.

Secretary—Sitwell Harris, Esq.

OFFICES AND MANUFACTORY—

Nos. 1, 2, and 3, Gough-street, North, Gray's Inn Road, W.

ABRIDGED PROSPECTUS.

THE leading feature of this Company is, that it investigates the merit of any invention submitted to it, by the aid of scientific and practical men, selected with special regard to their qualifications, as impartial judges. Such inventions as are approved are patented or registered, and manfactured by the Company, for sale, on a scale sufficient to establish their value, without cost to the inventor, who will share, under agreement, in all profits arising therefrom.

As an earnest of these intentions, the Managing Committee have secured a long lease, on most advantageous terms, of extensive premises, containing a spacious Manufactory, provided with suitable plant, where models can be made and tried, and patented articles manufactured for sale.

Valuable patents, already arranged for, are now being so manufactured, at a nett profit of 300 per cent.; while several very promising inventions are under consideration.

The advantages thus enumerated justify the Directors in recommending the undertaking to the notice of small capitalists, as an investment well worthy their special consideration.

That the large mass of inventors are unable to carry out their designs, is a fact patent to the most practical observers. It is equally true that a great number of cases only require the judgment and kindly assistance of scientific and practical men to render them productive of immense public benefit. It is incontrovertible that our national importance and wealth have been more promoted by inventors than by any other class of men. Arkwright, Watt, Cort, Stephenson, and others scarcely less eminent, have produced an amount of wealth almost beyond calculation, though their inventions were received at first with coolness and incredulity. In short, all the improvements for our convenience and comfort, dating from a state of barbarity to one of high civilization, are but the cumulative results of inventive ingenuity.

It must not be overlooked by the Shareholder that a patent gives an exclusive trade with the customers of the world, and that this Company will possess in no common degree such advantages as will, on the average, be immensely productive, and ensure a dividend that may surprise, and must satisfy all investors.

Applications for Shares, and full Prospectuses giving the fullest information, to be made, personally, or by letter, to the Secretary, at the Offices, as above.

Building Materials.

SAWING, PLANING, & MOULDING MILLS,

GREAT BRUNSWICK-STREET, DUBLIN,

MICHAEL MEADE,

HAVING nearly completed the extensive Buildings and Machinery for Sawing, Planing, Moulding, Tenoning, Grooving, &c., Timbers at his new works, begs to inform his friends and the public that he has REMOVED his business from Westland-row. In conjunction with his business as Builder, he has now opened a new department for the sale of all descriptions of Materials used in Building. Timber, Deals, Laths, Prepared Flooring, Skirtings and Mouldings of all Sizes and Patterns always on hand. Doors, Sashes, Sash Frames, Shutters, Architraves, &c., made to order on the shortest notice and most reasonable terms. Being the *only* Manufactory of the kind in Dublin, it offers an advantage to persons Building which has not hitherto presented itself in this country.

From M. M.'s long practical experience in the working of all descriptions of Timber, persons requiring their Timber sawn or planed will find a great advantage in sending it to the above Mills.

SUPERIOR Red Fronting BRICKS, also Prime Stock Bricks, delivered at any Station on the Dublin and Wicklow Railway, at Kingstown, Dublin, &c., can be had from

BENTLEY AND SON,

Lowest Cash Prices.

TIMBER AND SLATE STORES,
67, Great Brunswick-st., and 28, Sir John's-quay.

SLATES, TIMBER, SEWER PIPES, FLUE LINING, PLASTERING, and SLATING LATHS, Fire Bricks, Ridge Tiles, &c, Planed and Jointed Flooring, Mouldings, &c., for Sale, on very moderate terms, at the

LIFFEY SAW MILLS,
12 and 13, SIR JOHN ROGERSON'S-QUAY,
(Corner of Windmill-lane).
HUGH KELLY, Proprietor.

BUILDERS' GOODS, Kitchen Ranges, Ironmongery, Window Glass, Oils, Paints, and Paper Hangings, of the best qualities, at MAURICE BROOKS', SACKVILLE-PLACE, DUBLIN.

THOMAS TICKELL'S TIMBER & SLATE STORES,

193 & 194, NTH. KING-STREET (Corner Green-st.)

Importer of Fire-blocks, Bricks, Kiln, Oven, Floor, Ridge, and Pan Tiles, Bath Brick, Ridge and Sink Stones, Fire Clay, &c. Country Orders attended to.

TIMBER AND SLATE STORES,
SWIFT'S-ROW, Lower Ormond-quay
(Near the Metal Bridge).

Mahogany, Cedar, Rosewood, Walnut, Birch, American Ash, Pine, Deals, Staves, &c., &c. A large Stock of Staves on hands. Country Orders promptly attended to. GEORGE FINNEGAN.

OFFICE OF THE "CROWHILL, MILTON, AND KENMUIR QUARRY COMPANY (Limited)."

51, Renfield-street, Glasgow.

HAVING entered upon a Lease of those extensive and well-known Quarries—Crowhill, Milton, and Kenmuir, near Bishopbriggs—long wrought by Mr. Wm. Neilson, parties desirous of supplying themselves with a first-class Rock, will be served promptly with any quantity, however large.

From our facilities for despatching materials by private Railway to Forth and Clyde Canal, Builders in Ireland will find this a cheap and ready mode of supplying themselves.

Any orders with which we may be favoured, shall receive our best attention.

WILLIAM GRAY, Secretary.

Note—We refer for sample of our stone to the new National Practising Schools, at Lower Gardiner-street, Dublin, and new Exchange, Dundalk.

Iron Founders, Plumbers, &c.

BUILDERS' IRONMONGERY, at REDUCED PRICES.

THOMAS HENSHAW and CO.,

CLARK & CO., ORIGINAL INVENTORS & PATENTEES of REVOLVING SHUTTERS.

CLARK'S NEW PATENT SELF-COILING REVOLVING SHUTTER,

FOR SHOP-FRONTS AND PRIVATE HOUSES, AT **2s. 6d. per FOOT.**

MESSRS. CLARK & Co., of 15, Gate-street, Lincoln's-inn-fields, have recently introduced a New Self-coiling Revolving Shutter, for which they have obtained Royal Letters Patent, which, in addition to being one-half the expense, has the advantage of being remarkably simple, and, consequently, less liable to get out of order. All the complicated gearing apparatus is dispensed with; there are neither wheels, shafts, rollers, cords, nor weights to become deranged.

"We are disposed to think they will be largely used, both for shop-fronts and private houses. Much of the difficulty now often found in providing shutters for large bow windows may be obviated by their use, without extra cost."—From the *Builder*, June 26th, 1858.

Prospectuses, with full-sized sections, sent post free, with numerous Testimonials.

CLARK & CO., ENGINEERS, 15, GATE-ST., LINCOLN'S-INN-FIELDS, LONDON.

POWIS, JAMES, AND CO.,

Engineers, Patentees, and Manufacturers of all kinds of Machinery for working in Wood.

VICTORIA WORKS, BLACKFRIARS, LONDON.

ENDLESS BAND SAWING MACHINES, NEW PATENT.

NO MORE BREAKAGE OF SAWS.

POWIS, JAMES, AND CO., beg to call the attention of all who use SAWING MACHINERY to their NEW PATENT, dated August, 24, 1858, being an ELASTIC COMPOUND ADJUSTING LEVER MOTION ENDLESS BAND SAWING MACHINE, by which the STRAIN upon the SAW USED is so REGULATED that BREAKAGE OF SAWS "IS ENTIRELY DONE AWAY WITH."

ONE OF THESE MACHINES, UPON A LARGE SCALE, IN FULL WORK, AT HER MAJESTY'S DOCKYARD, DEPTFORD.

A STOCK OF MACHINERY FOR WOOD ALWAYS kept READY, including their PATENT MACHINE for MORTISING, TENON-CUTTING, and BORING, of which upwards of a THOUSAND have been sold in ENGLAND ALONE, and is the ONLY MACHINE which is SELF FEEDING, and doing the THREE KINDS of WORK by ONE MACHINE.

Also CIRCULAR SAW BENCHES with RISING TABLES, and Patent PLANING, TONGUEING, GROOVING, and MOULDING MACHINES.

Letters and Applications for Machinery to be addressed to

VOL. II.—No. 13.

SCHOOLS.

AS the twig is bent so the tree inclines," and as the child is reared, physically and morally, so the outward and the inward man are shaped. Hence the paramount importance that schools, where, in these countries, the rising generation—or at least such of them as to whom any education is imparted—spend on an average one-half of their waking hours, should be constructed both with a view to the physical requirements of the occupants, and the presenting of facilities for a system of a sound moral training being pursued. That it is *not* so, is a palpable fact, as regards the *general* minor schools through Ireland, in localities stated to be too poor to raise and support with the necessary appendages a suitable building for scholastic purposes; and some of these establishments though assumed to be under the wing of Government patronage, are little removed from the hedge-schools of old, and as long as permitted to last will remain a libel on our civilization and philanthropy. From sharing in this condemnation we freely except the important buildings erected of late years in the chief provincial towns, which are distinguished by commodious arrangements, and architectural features; but they are few and far between, and we hope now that as the buildings department of the Commissioners of National Education has passed to the Board of Public Works, that body will revise the existing petty school structures, both as regards arrangements and effect. The Enniscorthy, Newtownards, and Derry model schools, together with some others of their class for which plans have been prepared and preliminaries arranged with contractors, are a credit to the country, and all details ably and carefully digested.

The District Model buildings at Cork, Belfast, Limerick, and Waterford—the two formerly especially—together with a few others of lesser importance, are admirably adapted for scholastic purposes, though still beneath the acmè of perfection in many respects; yet we shall record with pleasure the projection of many others of a similar stamp, for which much necessity still exists. Throughout England, though "schools" are generally the most conspicuous, and probably among the handsomest architectural features in every town, village, and hamlet, their internal arrangements are not unfrequently sacrificed at the shrine of the architect's vanity to produce quaint effects and a pleasing *toute ensemble.* The Commercial Travellers' Orphan School at Pinnar is both a handsome artistic building, and a complete establishment of its class in all its internal arrangements. In Liverpool, Manchester, Birmingham, Bristol, and other chief towns, "schools" are to be found in every district, and of every class, from the humblest—invariably neater, more substantial, and suitable in character than ours—to the most costly structure with elaborate ornamentation.

In the United States of America some few handsome and well-arranged buildings for scholastic purposes—especially in those of Massachusetts, Wisconsin, and Minnesota—have been erected, yet, by the reports published in 1846, of the secretary to the Board of Education, the superintendents of common schools, the special visitors, &c., &c., we find the general schools, whether Primary, Grammar, Public, High, Intermediate, District, or State Normal—they are divided into these classes—universally condemned as unsuitable. From these reports many valuable hints may be collected as regards what schools ought to be, and attention is directed to many truths which come home to ourselves at the present day. From what we learn, the condition of the American schools, though partially improved since that date, is still most faulty.

• The Hon. Horace Mann says that

"For years the condition of this class of edifices, throughout the state of Massachusetts, had been growing worse and worse. Time and decay were always doing their work, while only here and there, with wide spaces between, was any notice taken of their silent ravages; and, in still fewer instances, were these ravages repaired. Hence, notwithstanding the improved condition of all other classes of buildings, general dilapidation was the fate of these. Industry and the increasing pecuniary ability which it creates, had given comfort, neatness, and even elegance to private dwellings. Public spirit had erected commodious and costly churches. Counties, though largely taxed, had yet uncomplainingly paid for handsome and spacious court-houses and public offices. Humanity had been at work, and had made generous and noble provision for the pauper, the blind, the deaf and the dumb, the insane. Even jails and houses of correction,—the receptacles of felons and other offenders against the laws of God and man, had, in many instances, been transformed, by the more enlightened spirit of the age, into comfortable and healthful residences. The Genius of architecture, as if she had made adequate provision for all mankind, extended her sheltering care over the brute creation. Better stables were provided for cattle, better folds for sheep, and even the unclean beasts felt the hand of reform. But in the meantime the school-houses, to which the children should have been wooed by every attraction, were suffered to go where age and the elements would carry them."

The Hon. Samuel Young says:

"The expense of constructing and maintaining convenient buildings, and all other proper appliances for the education of the young, is a mere trifle when contrasted with the beneficial results which inevitably follow. Of all the expenditures which are calculated to subserve the wants or gratify the caprices of man, there are none which confer such important and durable blessings as those which are applied to the cultivation and expansion of the moral and intellectual powers."

Further, the Hon. Horace Eaton remarks that

"In the construction of the school-house—embracing its material, style of architecture, and finish—as little care and taste are exhibited, as might be expected from the indifference manifested in regard to its location and surrounding circumstances. Cheapness of construction seems, in most cases, to be the governing principle, which decides upon its materials, its form, and all its internal arrangements. No complaint on this score could justly be made, if the general condition of these buildings were clearly and fairly attributed to want of ability. But while our other edifices, both public and private, have improved in elegance, convenience, and taste, with the increasing wealth of our citizens, our school-houses linger in the rear and bear the impress of a former age. Low walls might be instanced as *one* of the prevailing defects in school-house architecture. The quantity of air contained in a school-room of the usual height, is so small as to be soon exhausted of its oxygen: and the dulness, headache and depression which succeed to this result, are but too well known and too often felt, although they may fail of being attributed to their true cause. And why should our children be robbed of a comfortable supply of that pure and wholesome air, with which our Creator, in the largeness and richness of his bounty, has surrounded the earth and filled the sky? But if the condition of the house is such, as in part to prevent the injurious effects arising from deficiency of pure air, by means of broken windows and gaping crevices—then colds, coughs, and as the ultimate and crowning result—consumption—(and of this disease, what thousands of cases have had their foundations laid in the school-house!) must be the consequence of this sort of exposure. This is true in regard to *all* classes and conditions of pupils. But it should be distinctly kept in mind, although it is ordinarily overlooked and forgotten, that children accustomed to be comfortably protected against cold or vicissitudes of temperatuer at home, will inevitably suffer the more when exposed to them in the school-house. And here is an additional reason why these structures should be improved, as our dwelling houses are generally becoming more comfortable."

By arrangements now in progress we hope shortly to present our readers with some illustrations of American schools, when we shall resume the subject.

THE RIVER LIFFEY.—The name "Anna Liffey" is sometimes given to the river which runs through Dublin. It is an Anglicised representation of three Irish words, *Amhan na Life;* the first word, *Amhan*, pronounced *auicon*, signifies a river. It is cognate with the Latin *amn-is*, and the Sanscrit *aub*, and is the name still borne by our English river the *Aron.* The second word *na* is the genitive case of the definite article, and signifies *of the.* The third word is the proper name of the great plain through which the river flows. Thus *Amhan na Life* signifies *the river of the Life*, that is the river of the plain called the Lifé or Liffey. By "the Liffey," no ancient authority ever meant the river, but only the extensive plain, anciently so called, in which Dublin stands. Hence, when they spoke of the river, they called it Amhan-na-Lifé (Anglicised into *Anna Liffey)*, the river of this celebrated plain.—*Notes and Queries.*

Monthly Railway Memoranda.

GRADIENTS ON IRISH RAILWAYS.

THE Banbridge and Lisburn Railway is now making, with a gradient of 1 in 80 miles over 3 furlong curves.

The Dungannon and Omagh Railway, is nearly all composed of gradients of 1 in 80 and 1 in 100 over half-mile curves.

The Dublin, Wicklow, and Rathdrum Railway, with gradients of 1 in 80 over counter curves of 8 chains for 4 miles.

The Newry and Omagh Railway, now constructing, has the following gradients:—

9 Furlongs at 1 in 66.
15 " at 1 in 75.
6½ " at 1 in 100.

81½ or nearly 4 miles continuous.
8½ Furlongs at 1 in 100.
2 " at 1 in 100.
4 " at 1 in 75.
7 " at 1 in 100, with curves of 1½ furlong radius on inclines of 1 in 75 and 1 in 100, with a tunnel and heavy cuttings and embankments of above 46 feet in several places. These figures I have taken myself from tracings of the plans in my possession, and if these examples, and those of the latter four lines, so recently sanctioned by Parliament, do not satisfy those who have put faith in the absurd oracular judgment pronounced against the Letterkenny Railway, I would prefer them to the North-Eastern lines, with their enormous mineral and rapid passenger traffic—to the Whitstable line, and the Folkstone branch; and I am quite prepared to add numberless other similar cases in all parts of the world where railways have been introduced, especially in Spain; I may add that our estimates are ample to cover the cost of construction. The earth works are calculated at 2d per yard above the *actual* cost of several similar works *recently* executed in Ireland, and at 2d per yard above the estimates of other lines about to be brought before Parliament. There is no heavy mason work on the whole line, but a common double arched bridge, over the Swilly, and the geological features of the strata are peculiarly favourable, being *mica slate*, and even more friable than that through which the Machenlloth railway is executing in North Wales.—J. VANDELEUR STEWART.

* * *

DONEGAL RAILWAYS.—We have been informed that the Directors of the Londonderry and Enniskillen Railway Company have agreed to clauses being put in the Letterkenny Railway Bill, empowering the Company to subscribe £30,000 to the Letterkenny Railway, and £20,000 to the Finn Valley Line.

An experimental trip on the first section of the Great Northern and Western Railway—which extends from Athlone to Roscommon, has proved successful. The section is about twenty miles in length, and runs into the Athlone station on the Midland Railway. There is at present but a temporary station erected at Roscommon. The railway was constructed by Smith and Knight, English contractors. The line is not yet certified by the government inspector. It is not expected that the line from Athlone to Roscommon will be open for traffic till the 1st of February. The promoters presented Lord Crofton with a handsome silver candelabra of 24 lights, as an acknowledgment of his services in aiding their project.

At a recent meeting of the Dublin and Drogheda Railway, it was stated that the proposed extension line from Kells to Oldcastle, would follow the valley of the Blackwater for about six miles, and then proceed by another small stream up to Oldcastle. Its length would be twelve miles three-quarters. The gradients were perhaps as good as any to be found in the country, the worst being 1 in 200—though there might be a short one a little greater—which was singularly favourable. The works on the line would be exceedingly light. The estimate made out by Mr. Blackisson was slightly under £6,000 a mile; and there is little doubt but that the line would be contracted within that estimate.

Petitions have been deposited for the subjoined Irish private bills:—

Ulster Railway, Limerick and Ennis Railway, Athenry and Ennis Junction Railway, Belfast and County Down Railway, Waterford and Limerick Railway, Letterkenny Railway, Dublin and Wicklow Railway, Bagnalstown and Wexford Railway, Belfast and Ballymena Railway, Dublin and Drogheda Railway, Banbridge, Lisburn and Belfast, and Ulster Railway Companies, Carrickfergus and Larne Railway, Wexford Free Bridge, Dublin Corporation Water, West Cork Railways, Lough Foyle Embankment and Reclamation, Galway Harbour, Athenry and Tuam Railway, Kells and Bailiborough Railway, Dublin and Meath Railway, Londonderry and Lough Swilly Railway, Grand Canal, Midland Great Western of Ireland and Great Southern and Western Railway Companies, Newry, Warrenpoint and Rostrevor Railway, Portadown, Dungannon and Omagh Junction Railway, Banbridge Junction Railway, Belfast, Holywood and Bangor Railway (inland line); Ulster Railway and Corporation of Belfast, Railway Clearing House (Ireland), Galway Pier Junction Railway, Cork and Limerick Direct Railway, Dublin and Kingstown, and Dublin and Wicklow Railway Companies; Midland Great Western Railway of Ireland, Great Northern and Western (of Ireland) Railway, Waterford and Limerick, and Great Southern and Western Railways; Kilkenny Junction Railway, Kilrush and Kilkee Railway, and Pouluasherry Embankment; Moy River Navigation, Dublin (City) Steam Packet Company, Waterford and Kilkenny Railway, Fergus River Navigation Improvement and Embankment, Ennis and Galway Junction Railway.

The necessary forms for the Cork and Limerick Direct Railway have been complied with, and the deposit money is ready for lodgment. The mercantile importance of this project, as connecting the two greatest cities of the South of Ireland, has commanded the support of all practical men of business; and speculators are already looking upon it as a favourable investment.

THE EXTENSION TO MOUNTRATH.—This project has received a large amount of support in Waterford, and we understand that the principal proprietors along the line are most anxious to promote it. Mr. Hemans is the engineer in chief, and has been over the proposed line.

The conference just held in London, between representatives of the Great Southern and Western and the Midland Railways, has terminated by a final arrangement of the whole question regarding the Grand Canal. It has been agreed—the directors of the canal being consenting parties—that the holders of the stock of the canal shall be entitled to receive £50 for each £100 of stock—that each company shall contribute a moiety of the purchase money; and that the canal shall be managed, for the interest of the two railway companies, by a board consisting of directors nominated by both in equal proportions. In anticipation of some such final settlement, the stock of the Grand Canal has risen very considerably, having reached £47, within £3 of the price now agreed upon by the railway companies.

VENTILATION OF SCHOOL-HOUSES.

EVERY apartment of a school-house should be provided with a cheap, simple, and efficient mode of ventilation, by which the air, which is constantly becoming vitiated by respiration, combustion, or other causes, may be constantly flowing out of the room, and its place filled by an adequate supply of fresh air drawn from a pure source, and admitted into the room at the right temperature, of the requisite degree of moisture, and without any perceptible current. These objects may be attained by attention to the following particulars:

1. The location of the school-house must be healthy, and all causes—such as defective drains, stagnant water, decaying animal or vegetable substances, and manufactures, whose operations evolve offensive and deleterious gases—calculated to vitiate the external atmosphere, from which the air of the school-room is supplied, must be removed or obviated.

2. The means provided for ventilation must be sufficient to secure the object, independent of doors and windows, and other lateral openings, which are intended primarily for the admission of light, passage to and from the apartment, and similar purposes. Any dependence on the opening of doors and windows, except in summer, will subject the occupants of the room near such points to currents of cold air when the pores of the skin are open, and when such extreme and rapid changes of temperature are particularly disagreeable and dangerous.

8. Any openings in the ceiling for the discharge of vitiated air into the attic, and hence to the exterior of the building, or by flues carried up in the wall, no matter how constructed or where placed, can not be depended on for purposes of ventilation, unless systematic arrangements are adopted to effect, in concert with such openings, the introduction and diffusion of a constant and abundant supply of pure air, in the right condition as to temperature and moisture.

4. All stoves, or other heating apparatus, standing in the apartment to be warmed, and heating only the atmosphere of that apartment, which is constantly becoming more and more vitiated by respiration and other causes, are radically defective, and should be altogether, without delay, and for ever discarded.

5. Any apparatus for warming pure air, before it is introduced into the school-room, in which the heating surface becomes *red-hot*, or the air is warmed above the temperature of boiling water, is inconsistent with good ventilation.

6. To effect the combined objects of warming and ventilation, a large quantity of moderately heated air should be introduced in such a manner as to reach every portion of the room, and be passed off by appropriate openings and flues, as fast as its oxygen is exhausted and it becomes vitiated by carbonic acid gas, and other noxious qualities.

7. The size and number of the admission flues or openings will depend on the size of the school-room, and the number of persons occupying the same; but they should have a capacity to supply every person in the room with at least five cubic feet of air per

minute. Warm air can be introduced at a high as well as low point from the floor, provided there is an exhaustive power in the discharging flues sufficient to secure a powerful ascending current of vitiated air from openings near the floor.

8. Openings into flues for the discharge of vitiated air, should be made at such points in the room, and at such distances from the openings for the admission of pure warm air, that a portion of the warm air will traverse every part of the room, and impart as much warmth as possible, before it becomes vitiated and escapes from the apartment.

These openings can be made near the floor, at points most distant from the admission flues, provided there is a fire-draught, or other power operating in the discharging flues, sufficient to overcome the natural tendency of the warm air in the room to ascend to the ceiling; otherwise they should be inserted in or near the ceiling.

Openings at the floor are recommended, not because carbonic acid gas, being heavier than the other elements of atmospheric air, settles to the floor, (because, owing to the law of the diffusion of gases among each other, carbonic acid gas will be found equally diffused through the room,) but because, when it can be drawn off at the floor, it will carry along with it the cold air which is admitted by open doors, and at cracks and crevices, and also the offensive gases sometimes found in school-rooms.

9. All openings, both for the admission and discharge of air, should be fitted with valves and registers, to regulate the quantity of air to pass through them. The quantity of air to be admitted should be regulated before it passes over the heating surface; otherwise, being confined in the air chamber and tubes, the excessive heat will cause much injury to the pipes and the woodwork adjoining.

10. All flues for ventilation, not intended to act in concert with some motive power, such as a fan, a pump, the mechanism of a clock, a fire-draught, a jet of steam, &c., but depending solely on the spontaneous upward movement of the column of warm air within them, should be made large, (of a capacity equal to at least 18 inches in diameter,) tight, (except the openings at the top and bottom of the room,) smooth, (if made of boards, the boards should be seasoned, matched, and planed; if made of bricks, the flue should be round, and finished smooth,) and carried up on the inside of the room, or in the inner wall, with as few angles and deviations from a direct ascent as possible, above the highest point of the roof.

11. All flues for the discharge of vitiated air, even when properly constructed and placed, and even when acting in concert with a current of warm air flowing into the room, should be supplied with some simple, reliable exhaustive power, which can be applied at all seasons of the year, and with a force varying with the demands of the season, and the condition of the air in the apartment.

12. The most simple, economical, and reliable motive power available in most school-houses is heat, or the same process by which the natural upward movements of air are induced and sustained. Heat can be applied to the column of air in a ventilating flue—

1. By carrying up the ventilating flue close beside, or even within the smoke flue, which is used in connection with the heating apparatus.

2. By carrying up the smoke-pipe within the ventilating flue, either the whole length, or in the upper portion only. In a small school-room, the heat from the smoke-pipe carried up for a few feet only in the ventilating flue before it projects above the roof, is a motive power sufficient to sustain a constant draught of cool and vitiated air, into an opening near the floor.

3. By kindling a fire at the bottom, or other convenient point in the ventilating flue—

If the same flue is used for smoke from the fire, and vitiated air from the apartment, some simple self-acting valve or damper should be applied to the opening for the escape of the vitiated air, which shall close at the slightest pressure from the inside of the flue, and thus prevent any reverse current, or down draught, carrying smoke and soot into the apartment.

4. By discharging a jet of steam, or a portion of warm air from the furnace, or other warming apparatus, directly into the ventilating flue.

Any application of heat by which the temperature of the air in the ventilating flue can be raised above the temperature of the apartment to be ventilated, will cause a flow of air from the apartment to sustain the combustion (if there is a fire in the flue,) and to supply the partial vacuum in the flue, which is caused by the rarefaction of the air in the same.

In all school buildings, when several apartments are to be ventilated, the most effectual, and, all things considered, the most economical mode of securing a motive power, is to construct an upright brick shaft or flue, and in that to build a fire, or carry up the smoke-pipe of the stove, furnace, or other warming apparatus; and then to discharge the ventilating flues from the top or bottom of each apartment, into this upright shaft. The fire-draught will create a partial vacuum in this shaft, to fill which, a draught will be established upon every room with which it is connected by lateral flues. Whenever a shaft of this kind is resorted to, the flues for ventilation may be lateral, and the openings into them may be inserted near the floor.

13. With a flue properly constructed, so as to facilitate the spontaneous upward movement of the warm air within it, and so placed that the air is not exposed to the chilling influence of external cold, a turncap, constructed after the plan of Emerson's Ejector, or Mott's Exhausting Cowl, will assist the ventilation, and especially when there are any currents in the atmosphere. But such caps are not sufficient to overcome any considerable defects in the construction of the ventilating flues, even when there is much wind.

14. The warming and ventilation of a school-room will be facilitated by applying a double sash to all windows having a northern and eastern exposure, or on the sides of the prevailing winds in winter.

15. In every furnace and on every stove, a capacious vessel well supplied with fresh water and protected from the dust, should be placed.

16. Every school-room should be furnished with two thermometers, placed on opposite sides in the room, and the temperature in the winter should not be allowed to attain beyond 68° Fahrenheit at a level of four feet from the floor, or 70° at the height of six feet.

17. The necessity for ventilation in an occupied apartment is not obviated by merely reducing the atmosphere to a low temperature.

18. No apparatus, however skillfully constructed or judiciously located, can dispense with the careful oversight of a thoughtful teacher.

Although much has been said and printed on the principles and modes of ventilation, there is much to be done by educators, committees, and teachers, to enlighten and liberalize the public mind and action on this important subject—not only in reference to school-rooms, but to halls of justice and legislation, to churches, lecture rooms, and workshops,—to all places where human beings congregate in large numbers, for business or pleasure.

Mr. D. Leach, one of the agents employed by the Board of Education in Massachusetts, to visit schools and confer with committees in regard to the construction of school-houses, remarks:—

"In a large majority of school-houses, there are no means of ventilation but by opening the windows and doors. And where attempts have been made, it has been but imperfectly accomplished. The ventilating tubes have almost invariably been too small. As the result of my investigations, I would make the following suggestion. To ventilate a room properly containing fifty persons, the ventilating tube should not be less than fifteen square inches inside. The tube should be made of very thin boards, well seasoned, with a smooth inside surface, and it should be perfectly tight.. It should be wholly within the room, and opposite to the register or stove. There should be an opening at the top and bottom. The ventilating tubes should be connected in the attic, and conducted through the roof, and furnished with a suitable cap. Another method, which is far preferable, is as follows: The smoke pipes may be conducted into a cast iron pipe resting on soap-stone in the attic floor, instead of a chimney built from the bottom of the cellar. This cast iron pipe may be surrounded by a brick chimney, into which the ventilating tubes should lead. The space in the chimney should be equal to the spaces in the tubes, after making suitable allowance for the pipe, and the increase of friction. By this arrangement, the air in the tubes will be rarefied, and a rapid current of air produced. All attempts to ventilate rooms with tubes in the wall, or of less size than fourteen or fifteen square inches for fifty persons, have, so far as I have examined, failed. No artificial means will secure good ventilation when the temperature of the room and that of the outer air are nearly the same, without the application of heat to the air in the tubes. Unless the air is heated before being admitted into the room, it should be let in at the top, and not at the bottom, and always through a large number of small apertures. The quantity of pure air admitted must always be equal to that which is to be forced out."

VALUE OF TIMBER—THE OAK.—Three thriving oaks growing on a hard gravelly and poor soil were felled in Nottinghamshire, which on an average girted 15 feet at three feet from the ground, and each tree contained about 430 cubic feet of timber. The trees were planted in 1692 or 93, and were above 149 years old when felled. As these trees were perfectly sound and yearly increasing in size, it is probable that had they been suffered to remain another century, their bulk and cubical contents would have increased fully by one-half. The value of the trees when cut down was more than £120, a sum equal to thirty shillings per acre (without taking interest into account) for the land they occupied during the 149 years of their growth—a reply to such as state without consideration, that timber will not pay the rent for the ground it occupies or injures by its shade.—*Blenkarn's British Timber Trees.*

TEMPERANCE HALL.—The able prize essay by Mr. Macfie, on "The Advantages of Integrity in Working Men," was read by that gentleman at the meeting on Saturday evening last, and was favourably received by the audience. Mr. George D. Leathem presided.—*Derry Journal.*

Reviews.

Transactions of the Architectural Institute of Scotland. Session Eight, 1857–58. Vol. V., Part II.

THE last publication of the transactions of this institute—though somewhat less copious than might have been expected—is nevertheless creditable in every particular; and contains, together with two excellent papers—viz, on "the water works of the ancient Romans," &c. (portion of which we reprint in another portion of this journal), and on "the application of architecture to the commemoration of distinguished persons, with some remarks as to the completion of the National Monument, Calton Hill"—well executed accompanying lithographs, by Edinburgh artists, and illustrative of the amphi prostyle Doric temple on Calton Hill; sections of Roman aqueducts, piscinæ, leaden water pipes, elevations of the Claudian and Neronian Aqueducts, monuments, fontana, plan of the Diocletian thermæ, &c., &c. It affords us always much gratification to record these well-directed efforts to encourage art, and we feel convinced that much may be accomplished through such associations as this by a few individuals zealous and energetic in purpose.

Headstones, Tombs, and Monuments. By D. A. Clarkson, Architect and Sculptor. Atchley and Co., London.

THE second volume of this work being now complete before us, we can review its claims for patronage more definitely than when it was first introduced to our notice in *parts;* but in the main we have no reason to alter a previously expressed opinion, viz., "that the author's forte lies more in the designing of headstones than tombs or monuments." In the former department there prevails generally a pleasing variety, boldness, and freedom of outline; and many of the author's designs would prove an acquisition if erected in our cemeteries in lieu of the mongrel productions usually distributed there. The monumental slabs are especially noteworthy, and on the whole many suggestive ideas deserving of being perpetuated are introduced throughout.

Handy-book of Villa Architecture. By C. Wickes, Architect, author of "The Spires and Towers of the Mediæval Churches of England," &c., &c. London: Thompson and Co., 111, Strand.

So many books of designs for buildings of various classes have issued from the press, the majority displaying very little merit, and some much better consigned to oblivion; and so great has been the detriment effected thereby, not only to the professional man by usurping his legitimate calling, but on the national taste by substantiating monstrosities, that we confess ourselves to a certain extent prejudiced against *any* work of this character professing to instruct the million. Casting this feeling aside, however—at least for the moment—we judge the book before us on its merits, and this we may do without any effort, as we have the productions of a distinguished professional architect and author, and not those of an experimentalist or amateur to deal with. Mr. Wickes' work—which by the way is only the *first* series, the second of corresponding size and price being announced to be in progress—contains five sets of designs and specifications for villas, at cost varying from about £1,150 to £3,500, and in different styles and materials. The arrangement of the plans is decidedly commodious, and well adapted to the respective classes of probable occupants. The sections are practically explanatory, and the elevations, those of No. 2 especially, present some noteworthy features. We must, however, remark that Mr. Wickes seems happier in the designs of Gothic than Italian character. The volume is nicely produced in quarto form, and the lithographs in Day and Son's usual excellent style.

STEAM ON COMMON ROADS.—Now that a British steam-carriage is in actual and regular service in the United States, while not one American carriage is in such service in this or any other country; now that English machinists are supplying not only the roads of South America, India, and Australia, but districts all over the world that have no roads, with traction engines, while American mechanics, whose plans are already proved to be the better, have not secured the least liberal encouragement; now that steam vehicles are employed in the streets of London to haul loads which horses cannot conveniently draw, while the more practicable carriages which sometimes venture in our streets draw only the anathemas of our progressive people; now that steam waggons are in the actual service of the British government, while the authorities of our own city have refused to license public steam vehicles to run within its limits—it is time for us to glorify ourselves on a second stride in national progress and wealth. The first was the surrender of our transatlantic trade to the iron screw ships of foreign countries. We are wont, in everyday phrases, to style ourselves a "smart people," and the English "plodders" and "old fogies;" yet it somehow happens that our neighbours are a trifle in advance of us chronologically, if not intrinsically, in the little matter of steamships in the minor item of steam agriculture, in the trifling sundries of puddled steel and coal-burning locomotives. Our prowess in the manufacture of clocks, tools, and Yankee notions is indeed unquestioned, and our sailing vessels may be counted by the hundred (in our docks), but people are so exacting now-a-days that they will doubt our entire pre-eminence in the art of engineering if we allow the Europeans to slip ahead of us in any particular; let us, therefore, devote a passing thought to the subject of steam on common roads, to see if there is really anything in it worthy of our distinguished consideration. Steam-carriages ran successfully on common roads in Great Britain before railways were introduced, and were driven of by the extreme and unrelenting opposition of the land and stage owners, backed by the House of Lords. Railways evaded and by more brilliant promises overcame this opposition, and succeeded the common road service of both steam and horse coaches. What was the result? In attempting to cover the whole ground their proprietors have saddled themselves with 1,500,000,000 dols. worth of way and equipment, two-thirds of which have been sunk because the traffic was not in proportion to the outlay. The conclusion, therefore, that railways at 170,000 dols. per mile, and capable of a regular speed at 50 miles an hour, are hardly necessary for a traffic which may be economically accommodated at fifteen miles per hour on the public highway, and at a less working cost than that of horses at six miles per hour—this conclusion is not sufficiently outrageous to evoke legislative opposition in England. Meanwhile, in the United States, the stock of railways that penetrate the wilderness of new States for hundreds of miles has not been above par in all cases. Even in well-settled New England districts short branch roads have not been found to pay interest, even at slow speeds. Railways between cities and through populous towns are indeed the foundation of our national wealth; but the accommodation of small, short, stage-coach traffic, and the feeding of main lines by splendid, level, and costly roads of iron, have been found to pay about as well as would be the running of the Great Eastern between New York and Staten Island. Shall our rural districts—*i.e.*, several hundred thousand miles of highway—depend for ever on horse-power at six miles an hour, or can this speed be doubled, or quadrupled, and that at a reduced expense? Here are boundless regions cut off from the progress, isolated from enterprise, and dammed out of the channel of wealth by the simple want of cheap and rapid communication with great steam highways. Is it totally impossible to open up this comparative wilderness by any known means short of railroads at 40,000 dols. a mile?—*New York Times.*

AMERICAN ITEMS.

TORONTO.—The new University building is the finest in the country, except the Capitol at Washington. It is in the Mediæval style, with a frontage of 400 feet, a right wing 285 feet, and a left wing 273 feet. The towers are 110 feet in height, and the pinnacle 165 feet, above ground level. Externally it is built of fine grey stone, mostly from Cleveland, Ohio; and the dressings, &c., are of Caen stone. The roof is covered with Canada slate, and in tile fashion. Interiorly the building contains a main vestibule for entrance, promenades, &c.; a convocation hall in right wing, elaborately decorated with traceries and carvings by a Swiss artist, and floor inlaid with encaustic tiles from Shropshire (we presume Minton's); a senate chamber for meetings of the faculty, with magnificent stone fire-places, and stately carved mantlepieces; a public and a students' reading room; a library finished in white oak; a museum of natural history, decorated with black walnut carvings; a surgery; a laboratory, finished with blue and gold in antique style; lecture-halls, recitation-rooms, an immense dining-hall, with culinary offices, &c. below; students' quarters, suite of apartments for Dean of the University, &c. The grounds contain about twenty acres, and there is a botanical garden, and an observatory, with mounted telescope attached. The cost is said to have been 500,000 dollars.

The state Normal School Board have established the first school of Minesota at Winona, and the prudential committee are authorized to contract immediately for the requisite buildings—which are expected to be an ornament and pride to the city. Quite a number of substantial buildings of various shapes are being erected at Winona.

The amount of money expended by the State of New York, for internal improvements, has been as follows:—

	dols.
For the New York Canals	8,401,403
For the construction of the Lateral Canals ...	14,719,713
For the New York and Erie Railroad ...	3,000,000
For the Ithica and Oswego Railroad ...	315,200
For the Canojoharie and Catskill Railroad ...	200,000
For the Hudson and Berkshire Railroad ...	150,000

These sums granted to railroads have been either given outright, or have been lost by the failure of the railroad.

THE WATER SUPPLY OF DUBLIN.*

WE are now about to terminate with the year 1859 the *fifth* year of the water campaign in Dublin, which, like most wars—originating in the thirst of some few for personal aggrandizement—has drawn from the pockets of the many the supplies for *materiel*, &c., under the pretext of some wondrous advantage, never to be realized. The Corporation, *en masse*, with all their watery officials, have, after five years' battle amongst the bogs of the Dublin mountains, descended to the plain basin, and have, for the fifth time on the one question, "unanimously" stultified themselves; led to that act by the sound common sense of their generals (of two divisions), Gray and Codd. Like

> "The king of France, and all his merry men,

They (the Corporation)

> "March'd up the hill, and then march'd down again."

Not "with banners flaunting in the air," but to the tune of twelve hundred pounds, played out of the pockets and some of the mouths of the citizens of Dublin.

It is usually the case that "those who lead the dance should pay the piper," but their honors came four times to the "unanimous" decision, that it was the duty of the citizens to pay for corporate pastimes; declaring in each instance that nothing could be more conducive to the health of the poor citizens than the agreeable occupation they (the corporation) were engaged in. What a happy chance that in place of a *maestro de dance* they at last met men of common sense to lead them from their steps amongst the mountains, and safely deposit them, on their backs, in the Corporation Hall; for it is impossible to imagine a more perfect prostration, or a more thorough "floorin'" to all their honors (Mr. Whelan excepted) than the Corporation, "midst great applause," administered to themselves, after the sound and masterly exposé of the mountain madness given by Doctor Gray.

But, we have done with the folly now and for ever. When men "unanimously" admit themselves to be wrong, it would not be either generous or right to bear malice for the evil; we trust, however, the lesson will not be lost for the future.

We, however, dread the present phase of the water question almost as much as the former; not so much because there can be no question that truly pure and soft water may be drawn from the Liffey at Coyford, as now proposed, whilst from the mountain bogs and Dodder it would be most unwholesome; but the expenses will, in our humble judgment, be *incalculable*, and the supply from the Liffey be a cause of litigation perhaps the most fruitful that could be conceived.

One of the Corporation Council declares that, "no amount of money could compensate for the injury proposed to be done to his father's property running for miles along the banks of the Liffey." This is but the echo of the feelings of every owner of a demesne along the whole course. The millowners view the loss of water in another light—they must be compensated for a commercial damage. From Coyford to Dublin a host of claimants will spring up, whose demands must be entertained, and how to arrive at the amount of compensation equitably to be paid, seems to be a question impossible to answer.

If the attempt be made to impound storm water by the construction of "compensating basins" to keep up the supply in the Liffey at its *natural* height, it is scarcely possible to imagine a more certain arrangement to produce unending differences — what will satisfy *one* to-day, as being equal to a natural supply, will not to-morrow; desires will be thought rights—really natural deficiencies called Corporation robbing of the stream — millowners' demands for flour will almost always rise as the waters of the river fall;—demands for water will be most unceasing when most impossible to procure; and even without wishing to do wrong on either side, wrong will be done on both, without the possibility of knowing which is wrong and which is right. We have, in Ireland, the unhappy reputation of *desiring* to fight with each other. Let us avoid, if we can, the creation of so certain a *casus belli*; and if some arrangement cannot be come to witb at least three-fourths of the owners of the banks of the Liffey, before the works be put ito operation, we would say let them never be attempted.

The expense will be incalculable, from another cause. What engineer can estimate truly for the cost of *endeavouring* to construct compensating water-works in the locality they would be necessary?

Let us not be misled into the belief that estimates of such works and such demands can be made, under almost any circumstance, to be depended upon. We have within our view two recent instances to prove the utter fallacy of such an idea.

Already we have given a full exposition of the Liverpool or Rivington water-works. Estimates were proved there to be utterly fallacious; basins were constructed, on estimate, in positions where the necessary foundations were found to be 90 feet below the estimated depth. What was the result? The supply mains were estimated at a strength that when the supply came, they burst, and had to be hooped with wrought iron from end to end—a re-excavation of the whole being made. In fact, we believe no estimate was realized, from some cause or other—the main one of all, the quantity of water required, being perfectly erroneous. Above one million six hundred thousand pounds were expended, upon the plea of the *necessity* for a high pressure supply to every house—the inhabitants, it was said, could not live without it. Investigation will prove that low pressure is still almost the rule; high pressure nearly the exception; *and that that is paid for at an extra rate!* The necessity for *pure water* was the second plea for all the alterations; facts establish that the old supply is vastly purer than the new, and it is reserved for the rich, whilst the poor get the tainted water from the bogs of the Rivington hills.

Now let us look to Glasgow! The world has been astounded by the description of these "wondrous works," and of the "world-wide fame of the engineer," so chronicled in all the newspapers. The Queen went to open the supply to her subjects of the second city of the north, fully believing, no doubt, that she was aiding to give pure water both to rich and poor, and that when she graced the ceremony by her presence, the act would lead to similar undertakings elsewhere. Her Majesty little thought, we imagine, that the whole was in reality obtaining her presence under false pretences. The water-works of Glasgow are no more

---

* See page 157 *ante*, and previous numbers.

open to the citizens as a means for supply, than the waters from Coyford are to the people of Dublin. At an enormous cost, and the "world-wide fame of the engineer" (a fame which, in most instances, rests on the amount of expenditure), and at the cost of *twenty-five thousand pounds*, paid into the pocket of that engineer, for his fees,—the works have been so far completed that it requires about *three hundred thousand pounds* more, to bring the water the remainder of its journey, before the citizens get one glassful of it; and out of that £300,000 it is not impossible that the engineer will receive some £25,000 more before the job is completed. We heartily wish that some of our Irish engineers had the opportunity of gaining "world-wide fame" on such terms, and we sincerely believe they would do better service for the money.

Almost a similar scene has, within the last month, been enacted at a meeting of the Town Council of Glasgow, as at that of Dublin at their last meeting. Liberty was sought to apply to Parliament for a bill empowering the Corporation to raise £300,000 more to complete the water-works, and the facts we state are now a matter of public record. The Queen did not really open the water-works—she only aided in a ceremony tending to open the purse-strings of her liege subjects there, to the extent of £300,000 more. In vain some of the Corporation sought to check the hydrophobia; they were called all sorts of hard names for their impertinence, and, when soundly abused, they could not help themselves, for unless the £300,000 was got, to bring the water to its destination, both the labour and the money already spent was lost; therefore it was "unanimously" voted that the notice for the bill should be given; and so it has been. We believe, if the object of the Dublin meeting be realized, it will be at the cost of £300,000 also.

By baseless *estimates* have the water-works of Glasgow been commenced, and, it may be said, half-finished —"world-wide fame" has been established for the engineer—the public prints have eulogized the vastness of the expenditure, and just in proportion to its vastness has his fame been magnified. So it was in Liverpool; so elsewhere, in every instance—just as money flows forth from the rich, or from the combined pence of the poor, is merit estimated; hundreds, perhaps thousands, are employed; men look agape with wonder at what's doing, because they never saw it done before; the author of the work is looked upon as something superhuman, and the gold that showers down upon him from fees upon "the vastness of the outlay," gilds over with such brilliancy the outer surface of the work, that its flaws and fissures are but seen by the public eyes, although. mayhap, they may be vast enough to prove the whole a failure.

Liverpool has failed lamentably—scarcely one of its assumed advantages has been realized. Mr. Codd says it is because "its town councillors were at war, and have been unceasingly thwarting each other's views." But, we would ask, what has that to do with the quality of the water supplied, and the pretence that "every house should have a high-pressure supply." Neither have been realized, and yet one million six hundred thousand pounds have been expended.

Glasgow has, so far, failed, for it is at a stand still, and must be so, unless the legislature and the townsfolk agree to the outlay of £300,000 more, without any real guarantee that that will complete the undertaking. And the announcement has been recently made that when the high pressure supply is completed, and the water about to be let on, the city is to be divided into ten lots, the supply beginning with No. 1. *so that the citizens may be prepared for the casualties by bursting of the present water-mains, and their probable insufficiency to resist the pressure of the waters from Loch Katrine.* What an agreeable contemplation for the citizens of Glasgow! In Liverpool, the water-works authorities learned from the fact of the new pipes bursting, that the old ones could not bear the pressure; they therefore saved the overflow of the town, which must have taken place had the high-pressure supply been at once admitted into them; and whenever a high-pressure supply is now made, it is through pipes laid for it solely, and for which an extra rate is paid. Glasgow has learned from Liverpool; let Dublin learn from both! Water-pipes adapted for low-pressure service can no more bear the pressure necessary for high service, than low-pressure boilers bear that of high-pressure steam.

To estimate the cost of a high-pressure supply "to every inhabitant," as has been laid down as the *sine qua non*—the essential to sanitary laws—"that which the authorities are bound to insist upon for the safety and health of their fellow-citizens" (see the speeches in Liverpool, Glasgow, &c.)—is simply "a mockery, a delusion, and a snare;" unless the pipes used for low-pressure be removed, and new ones put down of adequate resistance. We must therefore ask the authorities of Dublin to calculate what that will cost for at least 100 miles of streets in our city, and to add it to the estimates. If that be *not* done, we sincerely believe that everything said as to the necessity for high-pressure supply for the general community of Dublin, is without foundation; and why the enormous expenditure proposed should be gone to, as the ground stated, we cannot comprehend.

But we have done with the subject for the present; we have conscientiously pointed out facts, which will one day prove themselves if the proposed measures be carried out. Dublin has been already saved from one great infliction—the catchment scheme; we trust she may be saved from another; but the citizens must put their shoulder to the wheel themselves—we cannot aid them more than by our humble representation of undeniable realities, which, we think, should be warning sufficient; but, if they will not be warned, the fault is not ours, and we must only be content that we have done what we conceive to be our duty, without ill-will or ill-feeling towards any one connected in the matter.

FENCES.—The cost varies according to materials used and style of work. For a single row of post and rail fencing formed of fir rails and prick posts, and larch posts four rails in height, the cost near London will be about 5s. 6d. per rod of 16½ feet. For strong cleft oak posts, ash and other rails and prick posts very strong, the charge has been 6s. 6d. per rod. In places where stone abounds this material is used for building walls as divisions between enclosures for road, fences, &c.; sometimes they are built dry, sometimes with mortar. In North Wales near Conway, the contractor will provide labour stone and mortar for such walls as do not require scaffolding, and build them in random courses faced on both sides, and 14 or 15 inches thick for 2s. 4d. per yard super; and from 18 inches to 2 feet thick, 2s. 6d. per yard super; labour only is 1s. 3d. per yard super for 2 feet in thickness.—*Blenkarn.*

BALLARAT NEW CEMETERY.—At an adjourned meeting of the trustees, held at the Chamber of Commerce, there were several plans submitted; some of them being of very large dimensions, elaborate details, and more or less picturesque in design and execution. The model was by Mr. Cuthbert, architect, late of Dublin. After examining the several plans and discussing their merits, it was resolved to give the *first* prize to the plan signed "Ne Plus Ultra," and the *second* prize to that signed "Spes." We believe the model was included in the latter vote, and is by the same gentleman as the author of the plan marked "Spes."

BELFAST.

The Blackstaff River, which runs through the south side of Belfast, has been a standing grievance to the inhabitants for nearly 20 years. The proverb says, that "It is an ill wind that blows nobody good," and we would vary it a little, and say, "It is a filthy stream which flows to nobody's advantage." The late astute town clerk and solicitor of Belfast could, if now alive, bear testimony that the Blackstaff did not flow unprofitably to him at least, proving that clever people can draw good out of evil. To those who may not be familiar with the locality it may be well to observe, that the Blackstaff River drains the valley lying east of the Black Mountain, on the south side of the town, being augmented in its course by the junction of the Forth and Pound Burn. The late Mr. John Sinclair, who died two or three years ago at an advanced age, stated that he remembered the Blackstaff a pellucid stream, abounding in fish, and fit for use either as a beverage or for culinary purposes. We regret to say that it has completely lost its character, and now only abounds in impurities and unhealthy odours.

Many plans have, at various times, been proposed by various individuals for the improvement of this river. Some may enquire, Why does it require improvement? It requires improvement because it has been, like the Thames and many other rivers, converted into an open sewer. The Pound Burn, in its course through the town, is the recipient of all sorts of impurity, from mills, sewers, &c., and finally empties itself into the Blackstaff, above the Saltwater Bridge. At this bridge and below it the Town Council have discharged several sewers into it, still further adding to its impurity. Now, our opinion as to what is required is, that the course of the river should be straightened, giving a uniform fall, and preserving its waters pure. This plan would be simple, efficacious, and inexpensive, and would contribute immensely to the manufacturing trade of the town, especially if a compensating reservoir were formed somewhere near its source, to regulate the supply of water, preventing floods at one period and scarcity at another. If this were effected, we would soon find its banks crowded with mills and manufactories of various kinds. We cannot see that any necessity exists for converting this river into a sewer; all that is wanted is to construct a sewer along its banks, into which those sewers terminating at the river can be discharged. Those proprietors of factories who now use the water may possibly have a clear case of damages against all who have contributed to render the water unfit for their use, and some surprise is stated to be felt at their not having hitherto asserted their rights in this respect.

The former proposed plan of the Town Council, and for which they obtained an Act of Parliament some eight or nine years ago, was to purchase land sufficient for a street 100 feet wide, and building ground on each side, carrying the river in a double culvert down the centre of the street—each culvert 12 feet wide and 10 feet 6 inches high. The length would have been about 3,500 feet, and has been estimated for the double culvert alone at £4 per foot, amounting to £14,000. The quantity of land required for a street 100 feet wide and building ground on each side, say 50 feet deep, would be 16 acres. What this would cost can only be matter of conjecture; but we would say not less than £14,000 more. Then we have law and parliamentary expenses to add, as well as the cost of forming and levelling the street, say £7,000—amounting in all to £35,000. But as the sum granted in the Act was only £15,000, without any compulsory powers, the scheme could not be carried out. We learn that the Town Council and the Ulster Railway have now both lodged plans and sections, and printed three proposed Acts for making a new street nearly on the site formerly contemplated, along which the river is to be carried in two culverts 24 feet apart, and along the centre of this space the railway company purpose forming a tramway.

The Town Council propose to take powers to divert the river, to purchase within two years such lands as may be necessary, and to give compensation for those taken and injuries done. The Blackstaff when diverted, and the street when made, to vest in the Corporation, their borrowing powers to be limited to £20,000. The Ulster Railway Company propose to take powers for the construction of a tramway along the centre of this street, from the terminus, following the course of the river to May's Fields, thence by Stewart-street, along the bank by the Queen's-bridge, thence along the quays to Clarendon Dock, with a short branch from the end of Chichester-street to the vegetable and pork markets. They propose also to repeal the Act of last year, relating to the Durham-street Bridge, to take new powers to build a foot bridge over the railway there, and to enlarge their station. The tramway will be double, and will cross the roads and streets on a level. They propose three years as the limit for taking land, and five for the completion of the works. Capital to be raised, £75,000. We hope that there will be a harmonious action amongst the numerous public bodies for the improvement of the town, and the construction of these works of undoubted utility. M.

LAW NOTES.

SWALLOW v. CHAYTOR.

A working builder sought to recover from defendant £121 4s. 11d., for work and materials and goods sold and delivered, &c., &c., at defendant's house, Killiney, Co. Dublin. The plaintiff also complained that the defendant converted to his own use his goods, namely, mortar, nails, lime, putty, scaffolding. The defence was, that the work was to have been done under a written agreement—according to which the plaintiff was to execute certain works for a sum of £400, within fifteen weeks, pursuant to drawings and specifications; and if Mr. Boyle, architect, thought the progress and quality of the work unsatisfactory, the defendant could declare the contract null and void, and the plaintiff to forfeit all claim under it. The defendant also pleaded that the work had not been completed within fifteen weeks, and that the certificate of Mr. Boyle was a condition precedent to an approval of the work by the defendant. To this the plaintiff replied that the default in the non-completion of the work arose from the non-supply of materials by the defendant; that the certificate of the architect had been collusively withheld; that the defendant had on this head waived objection; that Mr. Boyle did not consider the progress of the work or the quality of the materials unsatisfactory, and that even if he had done so the plaintiff was entitled to show that it was satisfactory. The defendant admitted the conversion of a portion of the property to the amount of £5, and lodged that sum in court. The plaintiff gave the defendant credit for any money he had received from the defendant, and also gave credit for any of the work that had been left unfinished. After a protracted hearing the jury found for the plaintiff, 123*l.*

Counsel for plaintiff—Sergeant Fitzgibbon, Messrs. Armstrong, Q.C., and Purcell; for the defendant—Messrs. Macdonogh, Q.C., Rollestone, Q.C., and Heron.

The New Ulster Bank, Derry.—In describing this building the *Derry Journal* says, "It is now almost completed, and, the palings being removed, the new edifice forms an object of great attraction in the locality which it ornaments. The front presents an imposing appearance, being built of Scotch freestone, after a design at once chaste and elegant, as well as highly ornamental. The building forms a slight curve at one end, which adds something to its graceful effect. The entrance to the cash office is at the end next Shipquay-place. The massive doors are of solid oak. A spacious hall intervenes between the entrance and the cash office, which is semicircular in shape, and lighted by three large windows. The counter, which is of polished oak panels, surmounted by a curved polished mahogany desk, extends the full length of the office, dividing it in the centre. The booths for the clerks—and which are handsomely carved—are placed next the front of the house, so as to obtain sufficient light, and ample room for the accommodation of the public is afforded outside the counter. The walls of the office are panelled round as high as the counter, and in the same style of polished oak, a large fire-place occupying the centre of the inner wall. The manager's office, adjoining which is the safe, is at the upper end of the public office, and is communicated with by doors on both sides of the counter. The upper portion of the house comprises the manager's residence, a private entrance being provided at the other extremity from the public entrance. The entire building has been erected and fitted up by the contractor, Mr. Matthew M'Clelland, with characteristic promptitude and taste. We should not omit to direct attention to the carved heads surmounting the doors and windows of the basement story, and the Ulster Arms over the chief entrance. These are the workmanship of Mr. Philip Doherty, sculptor, of this city, to whose works of art we have frequently referred. [We will add that Mr. Thos. Jackson, of Belfast, was the architect, and the bank has been opened for business.]

Further Improvements in Belfast.—We learn from the *Ulster General Advertiser*, that Mr. John Savage having recently purchased a large plot of ground enclosed by Peter's-hill, Old Lodge-road, Christopher-street, and Peter's-lane, has commenced various improvements including one from Peter's-hill through Israel-street to Old Lodge-road, and in making a main sewer down the centre of Old Lodge-road, and in Upper Townsend-street. Mr. Savage is also about to build these streets, and when completed, they will much improve that locality. It was intended that a street should be run from Upper Townsend-street to Carlisle Circus, thus forming one direct line of communication from the Antrim-road to the Botanic-road, passing the Ulster Railway. This would be of great advantage to the public, and such a road would increase the value of property in its vicinity; but it appears that objections are thrown in the way of carrying out the project, by one of the proprietors of the land through which such a street would require to be run.

NEW SERIES!

AGREEABLY with a previous promise we commence with this publication a new and illustrated series of THE DUBLIN BUILDER. Changes are always suggested by circumstances, and – guided by prudence – lead to important results. When we submitted our first number experimentally, we had no intention to adopt it as our *ne plus ultra* standard, but growing with our growth, and strengthening with our strength, we have fortified our resources and increased our magnitude consistently with requirements. Professional periodicals of our stamp being invariably illustrated, and the general tone of our supporters seeming to be in favour of our adopting a similar course, we willingly accede to their desires, not—be it understood—from necessity, or as a *dernier resort*, but because we are now in a position, which we were not in the first instance, to calculate pretty accurately probable support, and, as far as justice to ourselves will admit, desire that our friends should reap the fullest possible return for their kindness. If, without any assumption of egotism, we lay claim to merit for conducting this undertaking to a successful issue for the *first* year, it is that we have solved a hitherto undefined problem—viz., as to whether or not Ireland *could* and would *support* such a journal as ours, and by bringing a certain amount of energy to bear, have tested the experiment to the fullest extent. Embarking in new and responsible arrangements, it is cheering to find that on the advent of our second year, friends rally round us with redoubled vigour, and that past support, though liberally accorded, bears but small comparison with that now being received, and with what we are led to expect. We most earnestly impress on our friends that even now as regards our illustrations we cannot be supposed suddenly to attain a position of *super*-excellence. In this department we must graduate, as our predecessors have done; and as there is a marked contrast between the *first* attempts of kindred professional periodicals and their *present* productions, allowance should be made for us likewise in our infancy.

Yet withal, our present display will, we apprehend, satisfy the patrons of this journal, that our essay for their gratification in this department is of no paltry character, and we beg to assure them that on our part no effort shall be spared to fulfil our mission creditably. The Journal is further enlarged by the addition of a supplemental illustrated sheet.

WIDENING OF THE THOROUGHFARES.

WE understand that the house No. 25, Marlborough-street, together with the premises adjoining same, flanking towards Talbot-street, and in the possession of Mr. George Mark, tea merchant; also those at the rere, containing the workshops of Mr. Glennan, stone and marble cutter, have been purchased by the Corporation, and will soon be thrown down, with a view of widening Talbot-street, which at this point only presents a roadway of about 20 feet, but by the proposed arrangement will be increased to about 26 feet, with a spacious pathway likewise.

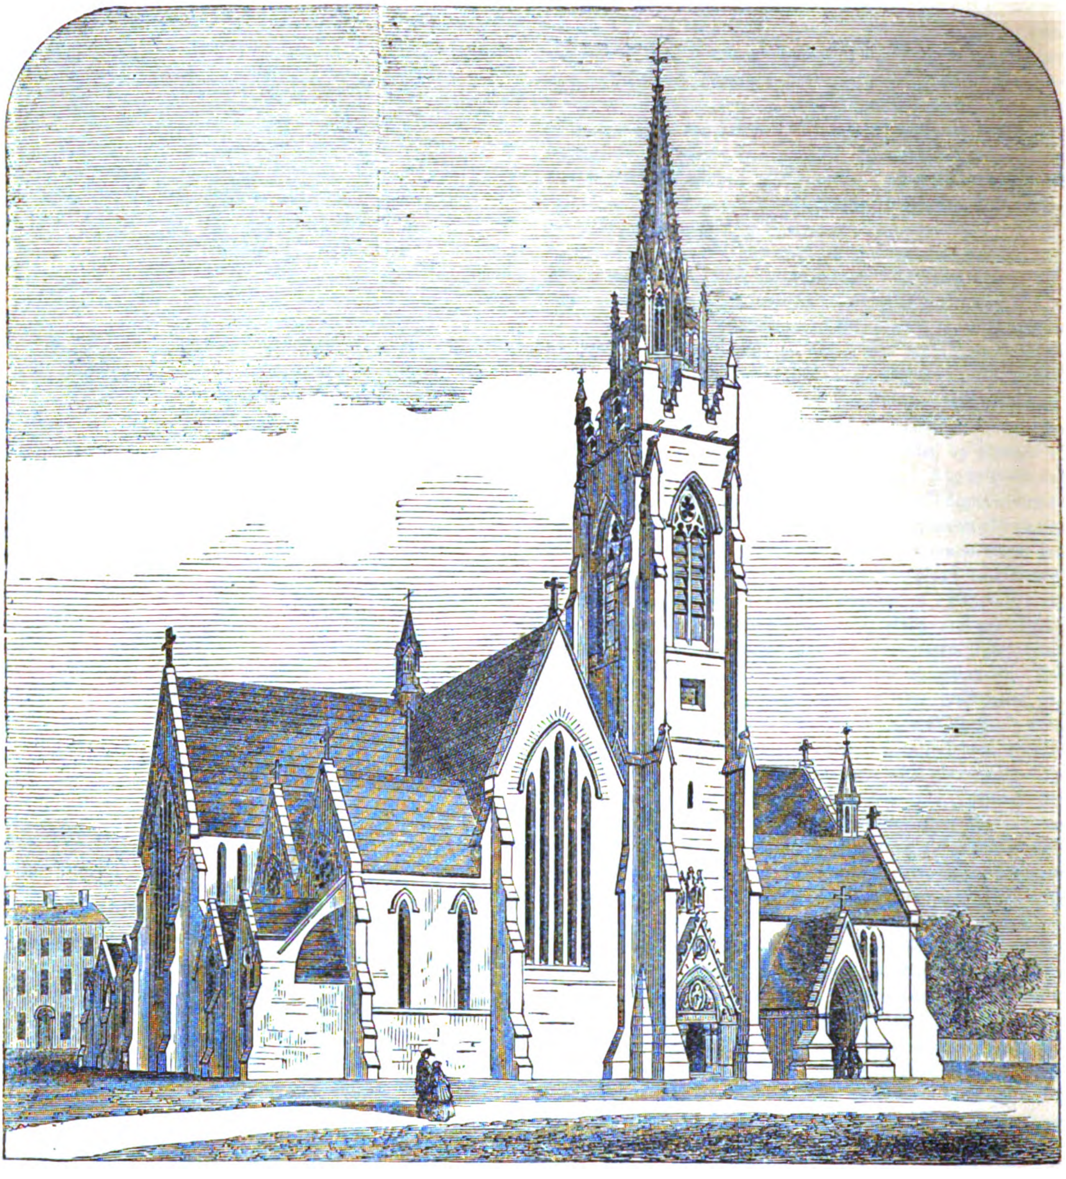
NEW GUILDHALL FOR CAMBRIDGE.

DURING the last three months or more, a competition has been in course of progress for a complication of purposes for the above University Town. At the same time that the old shire hall was to be kept to its present purposes, a large assembly room, a public reading room and a library, town clerk's offices and several committee rooms, a school of art for upwards of 80 pupils, and other minor requirements, were to be erected for the united sum of £6,000 on a limited site. The designs were also to include a large corn exchange, a magistrate's court, a large room as the council chamber, together with all the necessary waiting and other rooms for witnesses, barristers, &c., &c.; together with a telegraph office. These latter establishments are to be erected some 17 years to come, when the leases of the present houses on the site have expired. The twenty sets sent in, having been reported on by Professor Donaldson, and reduced to six, the Town Council further reduced them to two; and on the 16th December, awarded the first premium of £200 to Messrs. Peel and Stephens, of Maidstone; and the second premium of £100 to Messrs. John W. and Wyatt Papworth of London. We understand that both sets are designed in the Italian style of architecture; the latter being free in character, to suit the amounts and the masses of buildings.

THE NEW BATHS, LINCOLN-PLACE.

Now that the scaffolding is removed externally, and we are enabled to judge of the general effect of this first specimen of Oriental architecture in our city, we resume a description of the building. The principal front, as already stated, faces Lincoln-place, being about 186 feet in length, and a connecting building, in characteristic style and with separate entrance, follows the obtuse angle presented by the thoroughfare at its junction with Leinster-street. This portion will contain a spacious refreshment saloon, and also at the rere thereof an apartment where the Turkish bath system, as patented by Dr. Barter, may be applied to horses and other animals. Possibly we may hear by-and-by of elderly maiden ladies availing themselves of the system in restoring to convalescence their pet "tabbies" and "poodles," to whom the chibouk and the shampooing process will prove rather a novelty! The male and female departments are separated into each half of the building, to right and left of centre, by the ticket-office, which communicates with the respective entrance porches. The arrangements being the same in each, it suffices to state, that the divans or general rooms (32 feet by 20) are the first apartments approached by the bathers, and are fitted with open timber-work stalls at either side, constructed of pitch pine, furnished with low benches for dressing and undressing, separated by sheeted partitions and screened from view by scarlet curtains. Above these stalls is an ambulatory or platform—approached by a small flight of steps—which will be also furnished with loungers, and whereon the patients may enjoy their coffee and chibouk. The ceilings of these rooms are panelled and painted in many colours. Next is the tepidarium (16 feet square), where the first degrees of excessive heat are to be experienced, and where reclining slabs are provided. This apartment is waggon roofed, and has variegated lights therein, and ventilators in the wall to regulate the temperature. Communicating with this and of same size, is the *caldarium*, or hottest chamber, fitted with shampooing benches, and similarly constructed and lighted to that before described. Small closets, divided therefrom by open oriental-shaped arches, with piers and dressings of coloured bricks, contain cisterns supplying tubes, wherefrom hot and cold water may be distributed as required over the persons of the patients. The floors of principal storeys throughout are mostly composed of Minton's tiles, in various patterns, and beneath them are placed the hot and cold air flues communicating with the hypocaust, and by which any desired amount of heat may be produced. A spacious staircase leads to the board-room and other apartments on the first floor, and central rises an ogee-shaped dome to a height of some 50 feet, but which might, to our minds, have been made an internal, as well as an external, feature, as it can scarcely be adapted to any other than a lumber or domestics' sleeping room. 1st and 2nd class arrangements are provided, to suit the means of the patients. Externally the building is a decided acquisition, and the site seems to have been judiciously selected. Its general character takes both strangers and citizens rather by surprise, and many an enquiring countenance is directed towards its minarets, elaborate fretwork, half-moon apertures, tall variegated brick shaft rising 85 feet in the background, &c., &c., which form a very novel and agreeable contrast to the "western" style of architecture prevailing here. The front—with the exception of the base course, which is of granite—is entirely cemented in Portland, and its execution—the elaborate ornamentation especially, so novel to our workmen—is most creditable to the contractors for the plastering throughout, Messrs. Hogan and Son, of Great Brunswick-street.

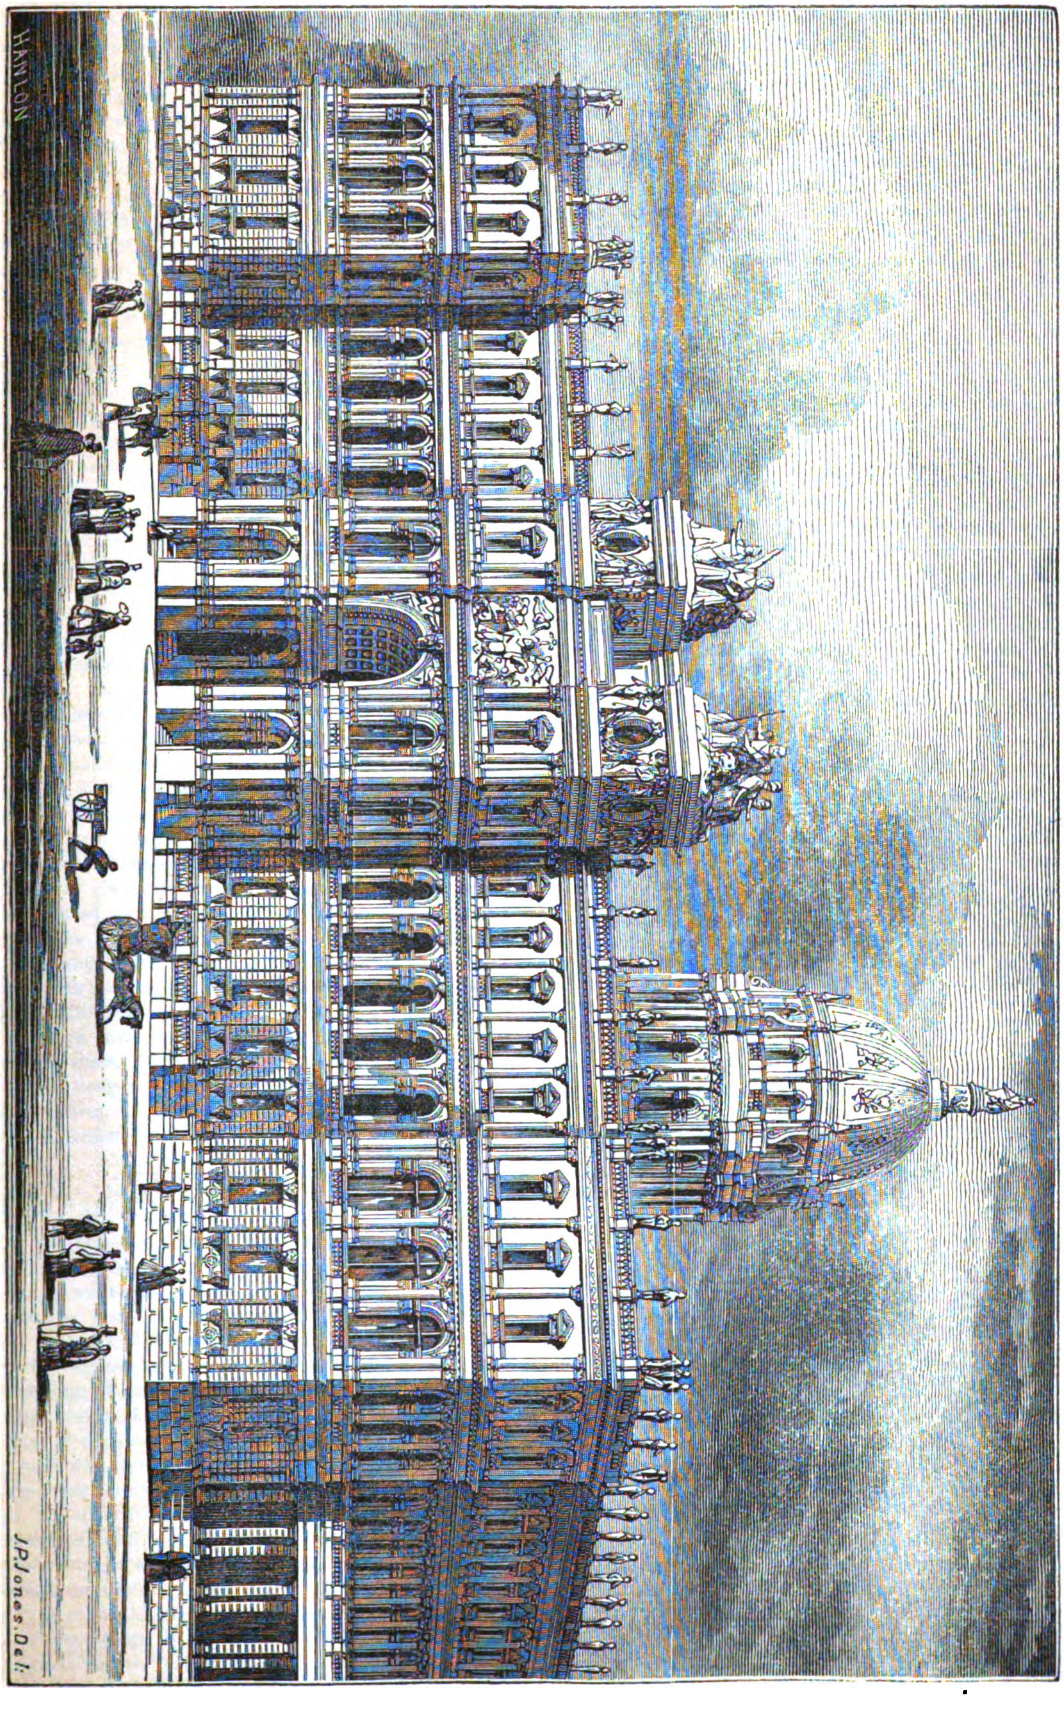
As a work of art, the building may be pronounced successful; and as its purpose has a philanthropic tendency, we trust that the speculation may prove equally so. Mr. Barter, architect and sculptor, of Cork, designed and superintended it to completion, Mr. Dwyer efficiently assisting as clerk of works, and Mr. Barry overseeing the masonry and heating departments. Nearly all—if not all—the artificers, except in the plastering and cementing departments, employed are Corkonians, and the work redounds to their credit. We understand that arrangements are being made for the immediate opening with some *eclat*. The system is likely to be largely patronized in Ireland, and no doubt will bye and by be modified, so that the humbler classes can avail themselves of it likewise.



LIMERICK CATHOLIC CATHEDRAL

LIMERICK CATHOLIC CATHEDRAL.

THE new Roman Catholic Cathedral of St. John's, at Limerick—of which we annex an engraving—is, perhaps, one of the most important ecclesiastical edifices erected of late years in Ireland, and is after the designs of Mr. Philip Hardwick, an eminent architect and Royal Academician of London. When first projected, plans were received in competition from various Irish professionals, and considerable dissatisfaction was subsequently experienced by the prize *never having been awarded.* The style of the building, as executed, is early Gothic, and the plan consists of nave, 30 feet in width, aisles, transept, chancel, 4 side chapels, 2 sacristies, tower and porch. The dimensions in clear are 168 feet—including chancel—by 74 feet; the breadth across transepts being 114 feet. On both the western and eastern elevations the nave and aisles present gabled ends terminated by crosses, and in the latter especially their grouping with the addition of the 6 extra gables formed by the side chapels and sacristies, is peculiarly effective. The great windows are 5-light tall lancets under a single arch, but wheel traceried lights are introduced into gablets, and double and single lancets with trefoil heads into other portions. The tower—which is on the northern flank at the junction with transept—is square, flanked with buttresses, surmounted with an embattled parapet, and divided into three stages, the belfry windows being louvred and traceried; a crocketed spire rising from a kind of broach on which an open octangular superstructure rests, will cap the whole, and form a pleasing composition. The external walls are of a superior class of masonry, and the dressings are of finely-wrought limestone.



DESIGN FOR THE WAR OFFICE.—J. P. JONES, ARCHITECT.

THE GALWAY ROYAL INSTITUTE.

An important structure is now in course of completion in "the citie of the tribes," which will supply a decided want in that hitherto neglected town, but destined—we trust at no distant period—to be a great highway from the Old to the New World. Very little indeed has been done in Galway in the way of building improvements, but a wide field is now being opened; and as transatlantic commercial intercourse increases, so must her prosperity and architectural requirements.

The new institute presents a frontage of about 40 feet by 70 feet flank, each elevation harmonizing in character, and displaying architectural features, with bowed connection between the two fronts. Towards the principal street, on ground floor, is a large business concern, with about 25 feet frontage and 33 feet depth, with central doorway, also communicating with a small office, a fire-proof safe room, parlour (15 feet square), pantry, hall, and staircase of private house. Immediately adjoining same, but totally distinct, and with separate entrance in bow, is another shop, 17 feet 5 inches in length, and parlour, 14 feet 6 inches by 10 feet, in connection therewith, with special bed-room over same, approached by a separate stairs. The entrance to the institute is nearly central on flank, and is through a recessed porch and hall, 8 feet wide, to a spacious staircase, leading to first floor, on which —irrespective of the bed-room described and a drawing-room, 22 feet by 15 feet, and closet for private house—two reading-rooms, 36 feet 9 inches by 21 feet 6 inches, and 18 feet 8 inches by 13 feet 6 inches, with w. c., are situate. On second or attic floor are a library of same dimensions as large reading-room, a smoking and caretaker's room, together with three bed-rooms for the private house. In the basement are various apartments, comprising kitchens, servants' bed-rooms, sculleries, cellars, &c., to meet the requirements of the habitations with which they are in connection. The plans throughout are admirably arranged, and in execution will, no doubt, prove most commodious.

Externally the elevations consist of three storeys, the lower (or ground) being a pseudo arcade, with vermiculated piers, impost mouldings, and semicircular-headed opens, with a bold continuous cornice above, and circular ornaments in spandrels; the first floor having square-headed windows, with consoles, architraves, and entablatures, and the second with smaller ones without dressings—the whole surmounted with a main cornice, astragal, and openwork parapet, with piers at intervals. The windows are intended for plate glass. The fronts are in cement, executed, with the rest of plastering work throughout, by Messrs. Hogan and Son, of Great Brunswick-street, Dublin; and the entire works have been carried out from designs and under the superintendence of Mr. E. H. Carson, architect, Dublin, by Mr. Austin Semple, builder, Galway; Mr. B. Killian, proprietor.

A DUBLIN "ARCHITECT" FIGURING IN LONDON.

In recording the proceedings at the Brompton County Court, our cotemporary the *Building News* devotes a quarter of a page of its valuable space, to what was evidently intended to appear as a very witty and amusing scene, in which "Irish," *of course*, were the principal actors; but the publication of which bears both a stupid and exaggerated *impresse*, and, to say the least, is not complimentary to the feelings of many supporters in Ireland of that (otherwise) excellent periodical. Comparatively scanty as are our resources to those of the journal in question, we confess that we can employ our space with matter dictated by much better taste than to reprint the colloquy between "Misther Jim Sullivan," an architect from Dublin, "Misther Terence Kiely," *alias* "Ginger," the judge, and the lawyers concerned; and, therefore, abstain from perpetuating the feeling of contempt and prejudice for our country, which is apparent enough amongst the classes who do not quite understand us or desire to do so, at the other side of the channel, without being additionally roused through the medium of a *professional* periodical. We must, however remark, that those who, from reading this article, conclude the profession in Ireland to be represented by "gentlemen" of such type as the "actors in this farce," labour under a serious error; one however, which—thanks to increased travelling facilities—is being gradually dispelled, and the *Irish* architect maintains his position in society as a professional man and a gentleman both at home and in every quarter of the globe. Such a dialogue might form an excellent plot for a low comedy in some of the London penny theatres, where caricaturing becomes a profitable source of business; but we can confidently state it is not relished here, nor is it worthy of a place in a professional journal hitherto deservedly commanding extensive appreciation in this country. Pursuing our own interests independently, we entertain no desire to place ourselves in antagonism with any of our cotemporaries—rather the reverse—for there is quite room enough for all; therefore, we wish it to be distinctly understood that our remarks are dictated by a sense of duty, and not for an interested purpose.

THE PROPOSED WAR OFFICES.

Our principal engraving this month, page 179, represents a hitherto unpublished design for the War Offices in London, and was submitted in the memorable competition wherein the entire professional talent of the world was called into requisition. Though not one of the premiated designs, yet discovering in the general composition many noteworthy features, and viewing it as the production of an Irish architect, we present it to our readers. We must also draw special attention to this fact, that everything connected with the illustration, except the subject, is "Irish"—viz., the *design*, *draughtsmanship*, *engraving*, and *printing*; all of which we, without any egotistical assumption, venture to submit are unexceptionably executed, and may fairly stand comparison with other illustrated periodicals; though it may be believed elsewhere that there is neither the *spirit* nor the *ability* amongst the Irish to produce a superior artistic illustration.

. NEW HOTEL IN WICKLOW.

A new hotel in the town of Wicklow, called the "Wicklow Railway and Marine Hotel," was inaugurated by a public dinner given in it on Saturday evening, 17th ult. The large building situated on the "Murrough," close to the railway station, formerly used as an industrial school, has been—by means of a capital of £5,000, provided by a joint stock company—converted into a hotel for family and general accommodation; which in point of style and extent is commensurate with the requirements of the locality, and the anticipations of progress which have already been in part realized in the county. The accommodation includes a suite of five large rooms, which can be united so as to form a dinner or ball room sufficient for the reception of upwards of two hundred persons. The hotel is under the patronage of William Dargan, Esq., whose name alone is enough to lend some celebrity to anything with which it is connected, and also of the directors of the Dublin and Wicklow Railway. The present proprietor, Mr. Joseph Softlaw, formerly of the Bridge Hotel, London, undertakes the management, with high recommendations from the great metropolis. The adaptation of this building to its present purpose, was effected under the direction of Mr. Louch, architect.

SUEZ CANAL.

This project has obtained the sanction of five European powers, England and Holland, alone withholding their approbation altho' none other have a deeper interest than they in a short cut to the Indies.

The canal proposed is to be cut 300 feet wide, 30 feet deep, and will be 90 miles in length, passing through level sand for its whole length. It is intended to have at the one end a double pier running 6 miles into the Mediterranean through the mud of the Nile, and at the other end a similar one 4 miles long running into the Red Sea. As the Mediterranean and the Red Sea are on the same level, the canal will be made 30 feet below the level of both, and hence it will be stagnant. To prevent the sandy sides of the canal from falling in, it must be cased with stone on both sides throughout its entire length, and to prevent the sand of the desert from blowing into it, a double parapet of sufficient height must be erected along its whole length. The casing of the canal, the parapets and the piers in the two seas will require stone work 200 miles in length. There is also to be a dock in the middle and a lock at each end. As there is no stone in Egypt, the proprietors propose importing it from Arabia Petrea and the Island of Cyprus. The estimate of the proprietors is six millions, but the late Robert Stephenson, Esq , was of opinion that the cost would exceed three times that amount.

CHESTNUT TIMBER IN OLD BUILDINGS.

IN our notice last month of the work lately published by Mr. Blenkarn, on *British Timber Trees*, we quoted the statement that "the timber of the *horse-chestnut tree* was little inferior to oak in durability, and that the late Mr. Pugin was often at considerable pains to make out this wood when he found it in roofs and joinery, and that in many of the engravings in his works of both foreign and English buildings, he has noted the timber by the word 'chestnut.'"

Since the above notice was issued, we have had our attention drawn to a very interesting and novel paper on this subject, by Mr. Wyatt Papworth, architect, which was read at the Institute of British Architects, of London, on the 14th June, 1858; and, deeming that it will be of great practical use to the architects of Ireland, we reprint the greater portion thereof from the Transactions of the eminent society above named. It will be noticed that the author of the essay does not acknowledge the use of the *horse-chestnut tree* at all.

Having made several enquiries, and having heard the result of others, I am inclined to believe that chesnut was *never used for timber*, at least in the large works in which it is generally attributed to have been employed. This may appear a bold assertion, but if you will listen to the grounds for my opinion, probably such statements as I have been able to collect, may suggest other conclusions than those usually received upon the use of this wood.

Harrison, writing in the time of Queen Elizabeth, only mentions the use, in times past, of sallow, willow, plum tree, hardbeam, elm and oak. Yet writers, for a long succession of years, even whilst quoting the above passage, and others from this author, declare that chesnut timber was largely used in earlier times for building.

The confusion appears to have commenced with Evelyn, or about his time. In the Sylva he states that "the chesnut is, next the oak, one of the most sought after by the carpenter and joiner. It hath formerly built a good part of our ancient houses in the city of London, as does yet appear. I had once a very large barn near the city, framed entirely of this timber; and certainly the trees grew not far off, probably in some woods near the town; for in that description of London, written by Fitz Stephens, in the reign of Henry II., he speaks of a very noble and large forest which grew on the boreal [north] part of it." "If the timber be dipped in scalding oil, and well pitched, it becomes extremely durable, but otherwise I cannot celebrate the tree for its sincerity, it being found that, contrary to the oak, it will make a fair show outwardly when it is all decayed and rotten within; but this is in some sort recompensed, if it be true that the beams of chesnut tree have this property, that, being somewhat brittle, they give warning and premonish the danger by a certain crackling." Many writers, copying each other, have misquoted the above cited passage in Fitz Stephen, and declare that he states that the Spanish chesnut grew in great profusion in the forests near London.

"Ducarel, in his Anglo-Norman Antiquities, p. 96, endeavours to prove that Old London was not only built with chestnut timber, but that there still continues a large tract of chestnut woods near Sittingbourne in Kent. I found on examination of these woods that the chestnuts are planted in rows about five yards distant from each other, without any trees scattered about, proving that they are not of natural growth. They are probably of the time of James or Charles I.

"We are told that the roof of Westminster Hall, Boston Church, and many others consist of this wood; not because any one hath found it to be so on examination, but because there are no cobwebs upon such roofs. Sometimes also, to account for spiders not harbouring in them, it is supposed that the timber is not English, but Irish oak. As this insect is known to subsist chiefly on the small flies which it surprises in its nets, the consequence is that it will no more be at the trouble of spreading its web where flies cannot be expected, than a fowler will lay his nets in a place where there is no resort of birds. No fly is scarcely ever to be seen but where there is a good deal of light and sunshine, consequently a wide wooden roof is the most improper place that a spider can lay its snares in: a whitewashed place would be selected by them in preference to a wainscoted one."

Ducarel, in reply, says, "In my Anglo-Norman Antiquities, I had observed that many old houses in Normany, when pulled down, are found to have a great deal of chestnut timber about them; as there are not any forests of chestnut trees in Normandy, the inhabitants have a tradition that this timber was brought from England. Rudhall, near Ross, in Herefordshire is built with chestnut which probably grew on the estate, although no tree of the kind is now to be found growing wild in that part of the country. . . . . The old house in the city of Gloucester (as the Rev. Mr. Crawley informs me that he has often been assured) are constructed of chestnut, derived assuredly from the chestnut trees in the forest of Dean. In some of the oldest houses in Feversham is much genuine chestnut as well as oak employed. In the nunnery of Davington, near Feversham (now entire), the timber consists of oak intermingled with chestnut. And the great beam of chestnut which supported the leads of the church tower at Feversham when it was lately pulled down, was found rotted for many feet at the extremity, and had as it were a mere shell of sound timber remaining about it."

Another writer, Mr. J. Thorpe, follows, and declares, that during the repairs of "the old house at Nettlestead, in Stockbury [near Maidstone, in Kent], a main girder, besides other timbers, were pronounced by the surveyor and the builder to be chestnut. Cowsted, in the same parish, is entirely of the same wood. The curious roof of the large hall of the mansion house at Leenes [near Erith, in Kent] is of chestnut, which no doubt was felled in the abbey wood there."

Hasted follows to the assistance of Ducarel, and states, "The ancient Norman buildings [he means buildings in Normandy] are mostly of this wood, which in all probability was fetched from this country. Most of the stone wherewith our monasteries and buildings of such sort were erected came from Normandy. This seems to have been a mutual traffic for some centuries between the two countries." "Oak timber is so entirely different from chestnut in the rings and spaces, which appear when cut transversely, that *it is impossible to mistake the one from the other*." Barrington, in replying to the three objectors to his views, says, "I have already said that I am willing to leave the point in controversy, upon what hath been advanced on the one side and on the other." It is curious that excepting the one observation about "the impossibility of mistaking the one wood from the other," these *four* writers do not attempt to describe the two woods.

In a work of a later date, it is stated that "many pieces of wood found in the old buildings of London, and supposed to be Spanish chestnut, were examined by Mr. Knight and found to be *forest oak*."

It is reported that about the year 1560, and for a century before, the English had exported vast quantities of oak from Ireland; and from a statement given in some of the scientific journals for 1856, it would appear that Irish oak was appreciated at a still earlier epoch, for "A record in St. Michan's Church, Dublin, which is verified by 'Hanmer's Chronicle' in the library of Trinity College, states that the faire greene or commune, now called Ostomontowne Green (now Oxmantown), was all wood, and hee that diggeth at this day to any depth shall finde the grounde full of great rootes. From thence, anno 1098, King William Rufus, by license of Murchard, had that frame which made up the roofes of Westminster Hall, where no English spider webbeth or breedeth to this day." In a treatise on Naval Architecture, by Nicholas Witsen, a Dutchman, in 1671, it is stated that the Hollanders were plentifully supplied from Ireland with oak, for the best and toughest of their work in shipbuilding. Of course the above extract does not allude to the *present roof* of the Hall; but in support of the probability of its being of oak as now generally asserted, and not chestnut, "Tradition," says Hayes, "gives the Shillela oak [a district in the county Wicklow] the honour of roofing Westminster Hall and other buildings of that age: the timbers which support the leads of the magnificent chapel of King's College, Cambridge, which was built in 1444 [begun, he should have said, as it was not vaulted till about 1515], as also the roof of Henry VIII.'s [VII?] Chapel in Westminster Abbey, are said to be of oak brought from those woods, and I think it by no means improbable, that the superior density and closeness of grain which is the character of the Irish oak, particularly in high situations and a dry soil, as may appear by comparing its specific gravity with that of other oak, added to the inattention of the Irish at that time to the article of bark, which permitted their oak to be felled in winter, when *free from sap*, might have induced the English architects to give it the preference in such material works; and it must be allowed that the present unimpaired state of these roofs, after so many centuries, seems very well to warrant this conjecture. It is generally understood that a sale was made of the finest timber of Shillela which remained in Charles II.'s time, into Holland for the use of the Stadt-house amd other buildings, constructed on piles driven close together to the number of several hundred thousand. In 1669, William Earl of Strafford furnished Laurence Wood of London with such pipe staves, to a great amount, at £10 per thousand, as are now sold for £50, and are only to be had from America. The year 1692 introduced into Shillela that bane of all our timber, iron forges and furnaces . . . . and it is inconceivable what destruction they must have made in the course of twenty years, which was the term of their contract."

Another authority for the present roof being of Irish oak is Barclay, who, in his Icon Animorum, published in 1614, and dedicated to Louis XIII. of France, mentions that the timber of Westminster Hall was brought from Ireland. Rees' Cyclopædia, article Westminster, contradicts its being of Irish oak, but states it to be of chestnut from Normandy; and Mr. Nightingale, in the Beauties of England and Wales, declares that it is built of chestnut supported by ribs of oak. The Irish oak, however, was employed by Charles

V. (who reigned in France as cotemporary with our Richard II.) for the roof of the library of the Louvre; and it is so stated by L'Abbe Sallier, in the Introduction to the great catalogue of the Bibliotheque du Roi (of which the Louvre library was the commencement), and this observation has been copied by later writers. Consequently it may be inferred that Irish oak *may* have been used at Westminster. Rondelet observes, that several old buildings near Paris, of which the timbers were supposed to be chestnut, were examined by Buffon and D'Aubenton, who found the pretended chestnut to be a variety of oak; and it is probable that a closer examination will prove the roof of Westminster Hall to be of oak.

The roof of St. Nicholas' Church, Great Yarmouth, is stated to be of chestnut. Whilst there I obtained the accompanying piece of what all the local carpenters call chestnut; it formed part of a standard to a former gallery, put up in 1640. The grain is very peculiar; but it is oak, not chestnut, and closely resembles a panel I have seen labelled as "English oak."

Brandon, in his valuable work on Timber Roofs of the Middle Ages, says, "they are all of oak or chestnut." The roof of Chartres Cathedral, burnt in 1836, was said to have been of oak and chestnut. In the description in the Monasticon of Castel Hymel, or Fineshed Priory, in Northamptonshire, there is an improvement on the misunderstanding: "In the granary lately taken down the beams were of *horse-chestnut.*"

Of another well known structure, still said to be roofed with chestnut, it is reported that "the timber used for the scaffolding, &c., and for the upper roof of the chapel [of King's College], seems to have been given to the college by Henry VII. and his executors, over and above the £1,000 before mentioned, for the college paid only for felling and carriage; it was brought from the Wethersfield Park, Poule Park, Walden Park, Ashden Halys, Bardefield Park, Broxstey Park, all of which are in Essex, and some from Cartlyng (Catlige) in Cambridgeshire; the timber of the roofs I believe was chiefly from Wethersfield." If this be correct, Hales, before quoted, is wrong in stating that it was obtained from Ireland, and tradition is again worthless: but did the county of Essex ever grow chestnut trees for timber?

One of the practical suggestions that has been made for discovering the difference between chestnut and oak is given in Nicholson's Dictionary of Architecture, who states that it may be found by driving an iron pin or nail into the woods while fresh: in the oak a black stain will be produced, but not so in the chestnut. I tried the experiment with the two fresh pieces sent me, and both of them have the stains; the two in the oak showed in two days, and o those in the chestnut, one showed in two, and the other in four, days' time. Another suggestion is to weigh a portion of the wood in question. Dry chestnut, according to Tredgold, "weighs from 34 to 38 lbs. per cubic foot, whereas dry English oak weighs generally from about 50 to 55 lbs. One dry specimen from an old oak tree weighed 39 lbs., or about the same as chestnut." On weighing the piece of wood from King's Stanley, above mentioned, I found a cubic foot of it would weigh 53 lbs.

A third idea is rather more laughable than serious, and has already been adverted to; it is one, however, which, from its being "a wise saw," ought not to be neglected, especially as the "spiders" are so often put forward as better authorities than ourselves in the settlement of what is oak or chestnut. In addition to what has been said in the earlier portion of this paper, you will find several remarks under the heading of "Spiders and Irish Oak," in Notes and Queries for last year (p. 268, &c.) 'thus, in Pointer's Oxoniensis Academia, 1749, is the following, in his account of the curiosities of Christ Church College. The roof of the aforesaid hall is remarkable on this account, that, tho' it be made of Irish oak, yet it harbours spiders, in contradiction to the vulgar saying. Tho' I am apt to think that there may be some pieces of English oak amongst the Irish; or else probably that particular smell that proceeds from that sort of oak, and is perhaps so distasteful to that sort of vermin, may be spent through age, or disguised by smoak, and so that common saying may stand good still.' It is also shown, p. 293, that the spider 'has *no dislike* to fixing its web on Irish oak;' also that 'no spider will hang its web on the roof of Irish oak in the chapel or cloisters at Winchester;' and 'chestnut is said to possess the same virtue.' 'The cloisters of New College, roofed with chestnut,' are free from spiders; 'the choir of St. David's Cathedral is stated to be roofed with Irish oak, and there are no cobwebs, although they are plentiful enough in other parts of the cathedral;' and lastly, that 'a fine old roof at Turner's Court, in the parish of Cold Ashton, Gloucestershire, four miles from Bath, is perfectly free from cobwebs, and is said to be of chestnut.'

The qualities of chesnut wood, as required to be known by us, are thus admirably described by Selby, in his History of British Forest Trees, 1842:—"The only particular in which the chesnut exhibits a decided inferiority (to the oak), is in the quality of its timber, which, unlike that of the oak, which gains strength and durability by age, begins to deteriorate at heart, ere the tree has passed much beyond the first half-century of its growth." "By some the chesnut has been considered as indigenous to England—the more general opinion, however, is that it is not a native, but was introduced at a very distant period, probably by the Romans. The belief which so long and so generally prevailed, and indeed, we may add, still partially exists, that the roofing and main beams of many of our ancient buildings and houses were framed of the chestnut, naturally gave rise to the idea that a tree so abundant and generally distributed as it must have been in former ages, must also have been of indigenous growth; for this supposed chesnut timber, we may remark, is not confined to buildings in the southern and midland districts of the kingdom, but is also found in the northern counties, and even in Scotland, for Sir T. Dick Lauder, apparently not aware of the discoveries of Daubenton and others, instances the roof of the parliament house at Edinburgh as constructed of chesnut:" and in a note, "It is remarkable that the same belief of the use of chestnut wood in ancient buildings also prevailed in France. Buffon, however, and afterwards Daubenton, showed that the timber taken for that of the chesnut was in fact that of quercus sessiliflora. The examination, however, and the repeated experiments of late years which have been made upon this wood, have satisfactorily proved that, in all such instances, the timber of the oak, and chiefly of the sessile fruited kind, have been mistaken for chesnut; and this fact, in a great measure, does away with any argument that might otherwise have been adduced in favour of the chesnut's indigenous origin, had the application of its timber in reality been as extensive as these ancient buildings seemed to indicate.

"In appearance and colour, the wood bears a resemblance to that of the oak, but may always be distinguished by its want of the large laminæ (flash) or transverse fibres which are seen in the oak, particularly when cut perpendicularly on the outside, in the plane of these laminæ" "For gate and other posts, railing, spars for building, piles, and various other purposes not requiring wood of large size, it is well adapted, and perhaps as durable as any other timber we possess."

Sir H. Davy, also, says, "it may easily be known by its want of the laminæ, as also from the pores in the alburnum of the oak being much larger and more thickly set than those in the chesnut, which cannot be distinctly seen without the aid of glasses."

The difference between the woods of the two oaks commonly seen in England, is that the grain of the wood of quercus sessiliflora is generally less varied and of a more uniform and deeper colour than that of quercus pedunculata and with less of that laminated appearance which is called the *flash* or silver grain. The trees are said to be known by the sessiliflora having the acorn stalks *short* or seated, with the leaves *long*; while the pedunculata is the reverse, having the acorn stalks *long* and the leaves *short*. The acorns of the former grow in clusters of two or three close to the stem of the branch; those of the latter grow singly or seldom two on the same footstalk. The quercus pedunculata, or robur, as it is more generally called, is the true old English oak, the sessiliflora being supposed to have been introduced some two or three ages ago, from the continent. There appears to be much diversity of opinion among botanists and planters on the value of the timbers of these two oaks, to the same extent at least as that already shewn to have existed on the use of chesnut; and some authors deny the botanical difference of the trees.

Chestnut timber has been often urged as a material for ship-building. One apparently qualified writer, Monteath, says, "Notwithstanding the excellent quality of the Spanish chesnut timber, which is equal to the oak in ship-building, and also for any machinery, yet it has not been generally used; but this tree should be both more planted and more used as timber." Also, "Spanish chesnut is used by cabinet-makers for boxing, at 2s. 6d. per foot, though it is of much more value when suitable for ship-building, as it is often used for that purpose." While Matthews, in a much commended work on Naval Timber (1831), says, "There is one circumstance connected with this timber in this country, at least in Scotland, which must prevent its general use in ship-plank, and be of material injury to it for ship timbers; this is, that few trees of it of size are found without the timber being shaky or split, some to such a degree that the annual rings or concentric growths have separated from each other." "From the use of the Spanish chesnut in the Spanish Navy, both in planking and timbering, and from the roofing beams and ornamental work of Westminster Hall being also of this wood, we should suppose it was not so liable to this defect of rents in the timber in milder climates. It is, we should think, as capable of supporting weight, when stretched as a beam, as the oak. Having much less proportion of sap wood, and from the matured wood containing much less sap or moisture, we should suppose it not so liable to dry-rot, or that more simple means, or a shorter period, would suffice for seasoning it, so as to be proof against this evil." According to Belidor, chesnut soon rots when built in a wall, therefore the ends of joists of this wood should have a free space left around them.

In the 10th volume of the Transactions of the Society of Arts, the writer urges that "for most purposes except ship-building, chesnut will be found equal to oak; and in buildings and out-door work much superior. In 1726 a piece 13 in. square was used as a hanging-post to a gate, and being found, after fifty-two years' use, perfectly sound, was again put down for a clapping-post. In 1743 a large barn was built with some of this timber, and is now sound in every part, as well as several chesnut posts and rails, after standing thirty or forty years. And a fencing made of oak and chestnut posts, being removed after twenty years' standing, the chestnut was found perfect, while the oak posts could not be used again without a spur to support them. The writer accounts for Evelyn's assertion of the decaying nature of chestnut, by stating that it is the case with old chestnut, that has been suffered to stand beyond the time of its attaining its full growth; it is then the worst of all timber, being more brittle and more apt to crack and fly into splinters than any other; but he adds, I have never known this to be the case with young chestnut. If it be cut when it squares only six inches, it will be as durable as an oak of six times its size and age."

From all these varied statements then, we may conclude, that the absence of spiders is not sufficient evidence to determine whether the woodwork under inspection is oak or chesnut, or even whether tbe either of those timbers.

Then when the outside of timber presents that rotten dusty apperance generally seen in old roofs, it will be next to impossible to decide whether it be of oak or not; and that the only way to discover the fact will be by obtaining a well smoothed portion of it, or if possible, a sight of the ends of some of the pieces, from which to ascertain whether there are any laminæ—the absence of them being the distinguishing mark of chesnut.

That taking into consideration all the evidence collected, there is no proof of chesnut timber having been used in mediæval buildings; therefore all results which have been promulgated upon the efficiency of a so-called chesnut timber must be valueless as regards that timber.

That certain experiments would appear to decide that small scantlings of chesnut are quite equal, if not superior, to oak for several purposes, "but the wood of old trees is unfit for any situation where an uncertain load is to be borne, as it is brittle." "It bends more than oak at the time of fracture, and therefore is tougher. Its toughness seems to permit it to yield insensibly till every particle exerts its utmost force, and then it gives way at once, more in the manner of metals than in that of woods." This well known circumstance alone, should have raised a doubt in the minds of some of our instructors, before they affirmed so strongly that chesnut timber had been largely used in our mediæval buildings.

THE WATER-WORKS OF THE ANCIENT ROMANS.*

AN abundant supply of pure water is a matter of primary importance to every family, and the greater the number of families collected together within a limited space, the more essential it becomes, both for health and for comfort, that the supply be ample, and if possible profuse. The ancient Romans were well aware of this, and expended a great amount of money, and applied much scientific skill to bring water to the metropolis, as also to the larger provincial cities, and to provide places where the water thus introduced might be employed for public use and recreation, as well as for domestic purposes. The ruins of these works are among the most imposing of the remains of ancient Rome, and the most careless traveller must have his attention arrested by the long but broken lines of arches extending here and there across the desolate Campagna towards the Sabine and Alban Hills.

The early inhabitants of Rome depended for their supply of water on the Tiber, and on the natural springs which rose up in various parts of the Seven Hills, and, according to the ordinary chronology, four centuries and a half elapsed before any other was introduced. The volume of the Tiber is indeed ample, but at Rome its waters are at all times too turbid to be employed except for the most ordinary purposes; they are unfit for drinking or cooking, unless artificially prepared, and would only be used in their natural state by a people unaccustomed to the comforts of civilized life. The impurity of the Tiber does not arise from matters held in chemical solution, but from the quantity of clay and other substances held in mechanical suspension, derived from the soil through which it flows for many miles before reaching Rome. It is so muddy, that it is impossible to see an object a few inches below its surface. The Anio joins it at a short distance above the city, and the contrast betwixt the two streams is very remarkable; the Anio of a blueish tint, but translucent as crystal, speedily disappears amid the liquid mud of the Tiber. Rome must also have derived a considerable supply from springs rising either within the walls, or in their immediate vicinity, and from one or two small rivulets. Several springs are named by ancient writers, of which the most celebrated are those of Juturna in the Forum, and of Mercury near the Porta Capena. It is, however, in vain now to attempt to discover these. They are buried deep under the accumulated soil of ages, and find their way unseen into the sewers or the river. Even the celebrated fountain of Egeria is unknown, for what is pointed out to travellers under that name, is clearly a nymphæum of comparatively recent date—the appendage of some suburban villa. A beautiful little limpid stream, the fountain of San Giorgio, rises by the side of the Cloaca Maxima, at the point where it is now open in the Velabrum, and immediately flows into it and disappears in the turbid contents of the great sewer. Some say that it is the water of the fountain of Juturna, which has found its way from the Forum to this point; but there is no proof of the fact, for it has never been traced by excavations. The water is reputed to possess medicinal qualities, and at certain seasons the Romans, of the lower classes, resort to it on this account—probably its best quality is derived from the remarkable contrast betwixt it and the contents of the Cloaca. The city is now so abundantly supplied from other sources, that there is no inducement to search out natural springs, whether ancient or modern.

The first aqueduct was constructed in the year U.C. 442, by the same Appius Claudius who formed the Appian Way, and who, in constructing these two important works, completely emptied the public treasury. We are more fortunate in regard to aqueducts than any other Roman antiquities, for we have a detailed account of them as they existed at the commencement of the second century of our era, drawn up by Julius Frontinus, who was named Præfectus Aquarum by Nerva, and continued in the office under Trajan. As soon as he was named Præfectus Aquarum, he commenced his duties by composing his "Commentarius de Aquæductibus," in order, as he tells us, in the second chapter, to qualify himself for the discharge of his new duties, and also for the benefit of his successors in office. When Frontinus composed his treatise, there were nine aqueducts which brought water into Rome. These were the Appia, Anio Vetus, Marcia, Tepula, Julia, Virgo, Alsietina (also named Augusta), Claudia, and Anio Novus. The total length of the nine was 278 miles, of which 243 were underground work, *i.e.*, culverts or small tunnels—7 miles were supported by embankments or plain walls, and 28 miles were supported by arches—with which latter our ideas of an aqueduct are apt to be rather exclusively associated. It will probably be making a very liberal allowance for subsequent aqueducts, if we suppose that they were doubled betwixt the days of Frontinus and those of the Regionaries; and if we do, and add to them all the provincial aqueducts of which remains exist, they are not to be compared in magnitude even with the canal works of Great Britain—a petty province of Imperial Rome. The Roman aqueducts were all constructed on what is now termed the gravitation principle. The simple idea was to turn a stream of water from its original course, and to convey it in an artificial channel (canalis or specus) to the place where it was required. In order to do this, it was necessary to form the channel with a slight inclination, so that the water might run freely forwards. Vitruvius directs that the slope shall be half-a-foot on 100 feet, *i.e.*, 1 in 200; but Pliny requires only a quarter of a foot on 100 feet, or 1 in 400. It was necessary to provide against the accumulation of air in the specus, and, for this purpose, vents or chimneys (lumina or columnaria) were inserted from 120 to 140 feet apart, and, but for this precaution, the compressed air would have impeded the flow of water, or perhaps burst the specus. It was equally necessary to keep up the level, so that the water might reach the proposed terminus, and hence the necessity for embankments, walls, and arches. The specus itself is, properly speaking, the aqueduct, the other parts are merely its accessories, and wholly subservient to it.

It has been warmly disputed whether or not the ancients knew the fact that water in a closed pipe rose to the level of its source. Metal pipes, both of lead and of bronze, were extensively used in the final delivery of the water throughout the city, but with no small suspicion of danger in using them, especially the leaden. Pliny says—"it is best to convey the water in earthenware pipes;" and Vitruvius denounces the use of lead pipes as unwholesome. "Water from earthenware pipes is much more wholesome than from leaden, because the water is so vitiated by the lead, that white lead is produced, which is said to be injurious to the human body." And again—"on no account is water to be conveyed in lead pipes, if we wish it to be wholesome." The Romans formed their lead pipes in a very different manner from our modern practice. A flat sheet of lead was rolled up so as to form the pipe, and the size of each pipe was named from the number of inches (16 to the foot) of width of the flat lead before being rolled up—thus a width of 10 inches formed a pipe named denaria, one of 5 inches quinaria, and so of others. Frontinus points out the inaccuracy of this mode of calculating the size, and proposes to derive the names from the actual diameters of the pipes. Vitruvius speaks also of pipes of thick leather, and Palladius of wooden: neither of which would be employed in extensive permanent works.

The mode in which the water was introduced into the aqueduct was very simple. If the supply was derived from springs, they were carefully sought out, and the water was at once introduced into the specus. If a portion of a river was to be employed, a weir or dam was constructed across the stream, and the desired quantity thus diverted into the artificial channel. In order to preserve the level (libra), and at the same time avoid the cost of embankments, walls, and arches, the specus was conducted, sometimes in a very devious course, along the sides of hills, to their points of junction, so that the artificial line greatly exceeded the actual distance from the fountain head to the city. When cut through solid rock, building is unnecessary, but when through earth or gravel, the whole was carefully lined, either with stone or brick; and in every case the specus was very carefully coated with well prepared plaster, and on the perfection of this part the efficiency of the whole depended. Many examples of it still remain in situ, and may be easily examined. It was prepared and laid on, coat after coat, with the greatest care. The commentator on Vitruvius, Philander Casolaonius, asserts that this substance was employed in coating the white specus, piscinæ and castella of the aqueducts. It might be worth while now to try the experiment on a small scale. The work, however, was not always perfect. Several of the poets allude to the water dripping from the arch of Drusus, which carried the Antonine branch-aqueduct across the Via Appia, beyond the Porta Capena, and within the modern Porto San Sebastiano. The specus were of various dimensions, according to the quantity of water which they had to convey; but that of each aqueduct seems to have been uniform throughout.

---

* By Alex. Thompson, Esq; and published in "Transactions of the Architectural Institute of Scotland."

The	Claudian	was	6 feet high	by	4 feet 3	inches wide.
„	Marcian	„	5 feet 6 in.	„	2 feet 6	„
„	Julian	„	5 feet	„	1 foot 9	„
„	Tepula	„	4 feet	„	2 feet	„

The historian Procopius asserts, that each of the fourteen great aqueducts in his day had specus of such dimensions, that a knight on horseback could ride along inside of them. Unfortunately for his correctness, six of these specus may still be seen and measured at the Porta Maggiore and Porta San Lorenzo, and the loftiest would barely allow his knight to walk along erect, without his horse and without his helmet.

(To be continued)

Correspondence.

DUBLIN TIMBER TRADE.

SIR—The stock of Quebec goods held in this market is larger than usual, and the quality of this timber generally is much superior to the imports of previous years, particularly in large fine board yellow pine and red pine, of which we hold a large stock. In addition to the superior quality of the red pine it is of much longer average length than usual, and thus affords a favourable opportunity to the trade in selecting long lengths, to get good timber, as it is almost impossible to get a long average of first-class timber from the Baltic. There is considerable inquiry for the board pine timber at from 70s to 90s a ton. There is little inquiry for pine timber for ordinary building purposes—while there is a very large stock of it in the market, its present value is not more than from 42s 6d to 57s 6d per ton, although at a recent public sale some of this class timber brought as high as from 60s to 67s 6d; but this is not a criterion of its value, and we believe some of the buyers must have mistaken it for board timber, it being just taken fresh out of the water. Memel—The present rates for crown are from 70s to 80s a ton; for second quality Memel there is very little demand except for railway purposes, at rates from 50s to 60s. There have been no red deals imported since our last circular, and stocks are still heavy, there being but little demand for this article. . Gothenburg red deals may be quoted at from 25*l* to 29*l*; Christiana red deals may be quoted at from 27*l* to 35*l*. At the sale of mahogany in Liverpool the value of this wood advanced considerably. For some time past we found a considerable portion of our country trade for log timber was diverted from this port, owing to the system heretofore pursued in this market of selling by string measure, obliging us to quote a higher rate than for which the timber could be had in Cork, Limerick, Waterford, and the northern markets, where it has been customary to sell by calliper measure, and we were forced to adopt the latter mode of measurement in order to retain that portion of the country trade properly belonging to this port, and, at the same time, establish one uniform measurement throughout the country. Calliper measure is used in the principal English markets, the freight and duty on timber are paid according to it, while it saves the purchaser the expense of re-measuring and canting the timber. *Of course for such of our town friends as prefer buying by string, we shall be happy to quote special rates.* JOHN MARTIN & SON.

Notes of New Works.

Mr. Jude of Grafton-street, in this city, hotel proprietor, has recently fitted up a grand *salon* in connection with his establishment. Mr. Matthew Lynch, of Camden-street, was the builder, and Mr. Barff executed the decorative portions. The panel wall and ceiling represents fruits, birds, and fancy designs. The ceiling displays bouquets of painted flowers, birds of varied plumage, and many specimens of instinct life. The salon is divided by triple arches, springing from bronze pillars surmounted by finely wrought semi-Grecian capitals, in white and gold, with the spaces richly ornamented in glass diagonal painting. The counter consists of five panels of elaborately painted designs on plate glass, surrounded by gilt mouldings, and well imitated yellow porphyry in oil. The slab of this counter is composed of carefully worked and moulded massive slabs of Italian marble, supported by gilded brackets, rising from pilasters, bearing on their faces exquisite designs in painted glass. Inside the counter highly-finished pillars, *en suite*, stand between large polished mirrors, and support a fine bold pediment. The mirrors, as well as the other ornaments, are in the *Louis Quatorze* style.

The War Department require tenders for additional alterations at Carrickfergus Castle, in the Belfast District.

The Port of Dublin Corporation are about erecting a lighthouse tower on the Calf Rock, and dwelling-houses on Dursey Island, Co. Cork.

A new school-house has been recently erected at Ballysteen, Co. Limerick, and the Earl of Dunraven subscribed £30, has also given a field for a teacher's garden, and will pay one pound for every pound subscribed elsewhere.

A new building has been erected for school-house purposes at Kilcullen, but remains incomplete for want of funds.

FRANCISCAN CHURCH, WEXFORD.—The high altar in this Chucrh has just been completed by Mr. Manderson of Dublin, after designs by Mr. Patrick Byrne, architect. The front and sides are of statuary marble, and the panels of Connemara green. The Tabernacle stands six feet seven inches in height, and will be surmounted with a gilt crucifix, extending to the top of the canopy, now in progress of erection. The Sanctuary will be flagged with Portland stone, and enclosed by oak railings. The Altars of the Blessed Virgin and of St. Francis (to be also of marble), are being prepared in the same establishment, and expected to be ready for erection early in the present year. Mr. P. O'Connor, builder, is about finishing the campanile or bell tower, and the internal fittings and decorations will shortly be proceeded with. We understand that the same manufacturer is at present engaged in preparing an elaborate tabernacle for the Roman Catholic Church of St. Andrew, Westland-row, according to designs also by Mr. Byrne, architect.

Improvements are contemplated to be made to the farm offices of Mr. Fox, at Coolegad, in the County of Dublin, after plans by Mr. E. P. Gribbon, architect.

New farm offices are being erected on the most approved plan at Dunganstown, Co. Wicklow. by the proprietor, W. Wright, Esq., from plans prepared by Mr. E. P. Gribbon, of Dublin.

Miscellaneous.

VENTILATION OF THE NISI PRIUS COURT.—This important question again recently occupied the attention of the Court and the Bar. Counsel complain of being kept in hot water by the pipes under their feet, and suggested that fire-places should be substituted for the pipes. It was humorously remarked that the learned gentlemen resembled the Alps, the snow being above their heads (*i. e.*, the legal horse hair,) and summer lying at their feet. The Chief Baron courteously promised to do everything in his power to meet the wishes of the bar in this particular. The court was so cold in the region occupied by the jury that they were permitted to wear their hats.

CORPORATION-HALL.—The assembly-room of this building has, we perceive, undergone a thorough renovation. Mr. M'Cool has tastefully painted the walls in warm coloured panels, while the elegant centre-piece on the ceiling and the ventilators are beautifully picked out in white and gold. The effect is exceedingly effective, and reflects the highest credit on the artist. The great gasalier has been re-laquered by Mr. Evans, of Pump-street, who has likewise supplied a number of chaste and ornamental brackets for the assembly-room, which contains no less than thirty-four lights. Altogether, the renovation of the hall reflects the highest credit on Mr. M'Cool and Mr. Evans, who are both Derrymen.—*Derry Sentinel.*

Almanacs for 1860.—These monitors of passing time and heralds of the new year have reached us rather plentifully and in many shapes—bookwise, large and small sheet, &c., &c., and at quoted prices ranging from 1d. to 2s. At the latter charge the Stationers' Company of London have produced a sheet almanac on very superior paper, the letterpress printed in two colours, red and black, and displaying a beautifully executed steel engraving of the proposed Atlantic harbour at Galway Bay, at this moment an object of universal interest. The old *Derry Journal* (A.D. 1772), presents its subscribers annually with an almanac supplement, well produced and usefully compiled. The *Building News* broad sheet, published with No. of that journal of 16th ult., is most comprehensive, and embraces —besides references to events chiefly of a professional tendency opposite each day of the year—a list of London scientific and artistic societies, also an alphabetical list of building material manufacturers and dealers, with their addresses—its own advertisers. Indefatigable "friend" Richard Allen published his almanac as usual with supplement to the *General Advertiser*.

The submarine telegraph at Liverpool across the Mersey from the landing-stage to Woodside Ferry, was successfully laid, and worked admirably for some time, when an accident occurred.

Stained Woods.—Some beautifully-executed specimens of stained, sized, and varnished woods have reached us from the establishment of Mr. F. Swinburn, Bush lane, Cannon-street, London.

Monumental.—Dr. Lanigan's proposed monument at Finglas is to be an Irish cross with suitable inscription. A distinguished antiquary (we believe Dr. Petrie) has promised to furnish the design.

The Commerce of Cork.—Upwards of 600,000 quarters of corn, worth a million sterling, are annually exported from Cork. An iron steamship factory was introduced by Mr. Pike thirteen years ago, and commencing with a screw steamer of 200 tons, subsequently built the fine fleet of the Cork Steam Packet Company, and at present a steamer of 1,200 tons and 295 feet in length, is on the stocks. The docks and ship-yards at Whitepoint, and those of Mr. Browne at Passage, are the most extensive individual establishments in the kingdom, and sufficiently capacious to accommodate the "Persia," the largest of the Cunard line. The Weser, 3,900 tons and 700 horse power, drawing twenty feet of water, had her machinery improved, and was repaired in Cork, at a cost of £10,000. The Cork Gas Consumers' Company, lighting the city at a cheap rate, divided 8 per cent. on shares now at 60 per cent. The Cork Brick Making Company is said to produce as good and cheaper bricks as imported from England. The Cork Waterworks erected by Sir John Benson, C.E., at a great expense, are most effective, and produce an abundant supply of aqua vitæ.

Bray's Traction Engine.—One of Bray's traction engines, denominated the "steam horse," manufactured by Mr. Taylor, of Birkenhead, for special use to supersede the employment of teams of horses in the removal of timber and other materials, ordered by the Board of Admiralty for service in the dockyard, Woolwich, steamed down from London lately, and reached the dockyard at half-past 12, having started from London Bridge at 11. The committee having assembled in one of the unoccupied areas selected for the trial ground, the "steam horse" was brought forward under the perfect control of the helmsman and engineer. It was then tested at various rates of speed, and was driven repeatedly round, forming a circle of about 60 feet in circumference. It afterwards proceeded along the principal thoroughfare of the yard at a speed of eight or ten miles per hour, and was subsequently handed over to the authorities. The engine, unlike any former one, is fitted with carriage springs, to reduce the amount of friction, which would otherwise be considerable, from the effect of the stony and uneven roads over which it is destined to travel. A couple of trucks, intended to be attached to the engine, are in course of construction, and when completed will be applied to the daily use of the yard.

The sum paid for gas in England is estimated at £6,000,000 a-year.

Manufacture of Gas.—Mr. Ernest de Caranza, Paris, proposes to take gas from boghead, or ompelite clay, greasy sawdust from wood which has been used in cleaning fatty matters, pit coal, and fatty residues left in the extraction of schistic oils in the following proportions: Boghead clay, 50 parts; sawdust, 30 parts; fatty residues, 15 parts; pit coal, 5 parts; variable, however, according to the richness of the matters. The substances are treated in retorts, whence the gas is received in a refrigerator and purifier, and after passing through lime enters the gasholder. The system is intended principally for use in private establishments.

A young Polish artist, Boryczewski by name, has just been commissioned by the Librarian of the Imperial Library of St. Petersburgh to execute a bust of Sir Roderick Murchison. The model in clay is now exhibiting at the museum in Jermyn-street, London.

A New Artificial Light.—An improved form of lime light originally experimented upon by Captain Drummond, some years since, was shown by Sir Charles Bright in the Exchange News-room, Liverpool, on Saturday last. No substantial improvement has been made in artificial lighting since the introduction of gas at the commencement of the present century; and the steadiness, continuity, and diffusiveness of the new light, as well as its enormous power, were fully shown. A single jet of the improved lime light is estimated as equivalent to 40 Argand, or 80 fish-tail burners, each consuming five cubic feet per hour, or to 400 wax candles of four to the pound, and its power, unassisted by a reflector. was stated to be forty times greater then the present oil lamp; and for coast lights, under the same circumstances, should the light be as economical and capable of as easy manipulation as it was on this occasion, there can be no doubt it will effect a considerable change in the lighting of lighthouses, public rooms, large thoroughfares, and probably of factories and other crowded places, where the present system of extracting the oxygen requisite for respiration from the air is so objectionable.

Coffins Made of Glass.—The *New Albany* (Ind.) *Tribune* has the following:—"Mr. Cannon, of this city, has obtained a patent for glass coffins. The coffin is made of glass, from one half to an inch thick, cast in two pieces of the ordinary form. In the upper edge of the body of the coffin is a groove, in which a tongue in the lid loosely fits. When a corpse is placed in the coffin this groove is filled with melted cement; the lid is placed on and firmly held by three iron bands until the cement is hardened. Through a small hole in the top of the coffin the air is then extracted by means of an air pump. By these means Mr. Cannon claims that bodies may be preserved in their natural state for all time to come, and when placed in vaults can always be accessible to the gaze of those who are left behind. The expense of these coffins will be no more than that of the ordinary wooden coffins, and if the expectations of the inventor are realised so far as the preservation of the coffins is concerned, they will immediately come into general use."

Sheds at the Galway Floating Docks.—Plans and specifications of dock sheds have been prepared by Mr Roberts, C.E. The same gentleman submitted plans for a jetty to run out from the dock into the pool, by which the steam-tenders will be enabled to take off passengers and cargoes at all states of the tide. These works will probably be commenced immediately.

Gas in the Provinces.—The Right Hon. Lord Cloncurry has just completed the lighting of his residence at Lyons with gas. Messrs. Edmundson and Co., of Capel-street, executed the necessary works, and are also engaged in erecting gas works for the Duke of Leinster, at Carton, and many similar orders with their patent gas apparatus, which is of simple construction, and produces a light of very great brilliancy.

The National Portrait Gallery exhibits a portrait of Chantrey, by Phillips, a present from Lady Chantrey; also, Dr. Erasmus Darwin, painted by Wright, of Derby. A delicately-pencilled miniature of the celebrated caricaturist Gillray, by himself. The Hon. Lieutenant-Colonel Bagot was the donor.

The inhabitants of the town of Ballyshannon have made an application to the Lord Lieutenant that the provisions of "The Towns' Improvement (Ireland) Act, 1854," so far as they relate to the lighting and cleansing of towns, may be carried into execution in the said town.

The marine barracks at Chatham are to be greatly enlarged, at the cost of £100,000.

Government has given a grant of £200 for the completion of the Catalogue of Museum of Antiquities, Royal Irish Academy.

To Correspondents.

J. B., Tywyn, North Wales (Vol. for 1859, with wrapper and index, shall be forwarded when ready in a few days). B. P. W. (Quite an erroneous supposition—shall hear). M'C., Belfast (Better send your orders direct to the office, pending agency arrangements)

NOTICE.

Orders for Subscriptions to, and Advertisements for, THE DUBLIN BUILDER, *will be received at the Proprietor's Office,* 17, LOWER GARDINER-STREET. *Wholesale Agents*—Messrs. W. H. SMITH & SON, *Sackville-street (from whom* "THE DUBLIN BUILDER" *may be had at every Railway Station), and* GEORGE MASON, 24, *D'Olier-street.*

Post-office Orders and Remittances should be made payable to MR. PETER ROE, 42, MABBOT-STREET, DUBLIN.

☞ *NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the* DUBLIN BUILDER." *All other Communications should be addressed to the "Editor."*

BUILDING SITES FOR DETACHED HOUSES—BRAY RAILWAY.

THE Lands of GALLOPING GREEN, FOXROCK, and KERRYMOUNT, are being laid out for Detached Houses, and will be Let in Lots, from One Acre to Ten Acres each, on moderate terms. They are very elevated, and command magnificent sea and mountain scenery; are within Two Miles of Kingstown, and within Three Minutes' walk of the Stillorgan Station at one end, and of Carrickmines at the other, besides which, in order fully to develop these beautiful sites, the Railway Company have arranged to establish a Station on their Line at the centre of Foxrock, from the 1st of September next. Omnibusses will ply between same and Kingstown, for bathing, shopping, &c., as soon as the first 12 houses shall be fit for occupation.

Several Lots are already Let, and some of the Houses nearly finished. Lease 900 years.

N.B.—Superior Bricks, Stone, Sand, and Lime on the Lands, and will be given to the Tenants on very moderate terms.

Lithographed Maps, showing the New Roads, &c., and all further information, may be had from the Steward, at Foxrock; Mr. W. W. Bentley, Foxrock Lodge; or at Messrs. Bentley's Offices,

110, GRAFTON-STREET, DUBLIN.

NEW GAS REGULATOR AND PURIFIER.

MESSRS. DEFRIES & SONS, of London, having taken out a Patent for the above new Gas Burner, we beg to announce that we have just made arrangements with them for the special sale of it.

This artistic and complete Burner is the most economical ever introduced, and is the admiration of all scientific men, on account of the various qualities it possesses.

First—It purifies the Gas by filtration, and allows no more Gas to pass through the Burner than is absolutely required to give a full, clear, and brilliant light.

Second—It effectually checks all undue pressure, and does away with the unpleasant flickering and noise caused by the same.

Third—The interior is anti-corrosive, and is impossible to get out of order, and when once set right it will last for years.

Fourth—This Burner answers with any common nib, and is unerring in its operation.

Fifth—It can be fitted by the most inexperienced hand.

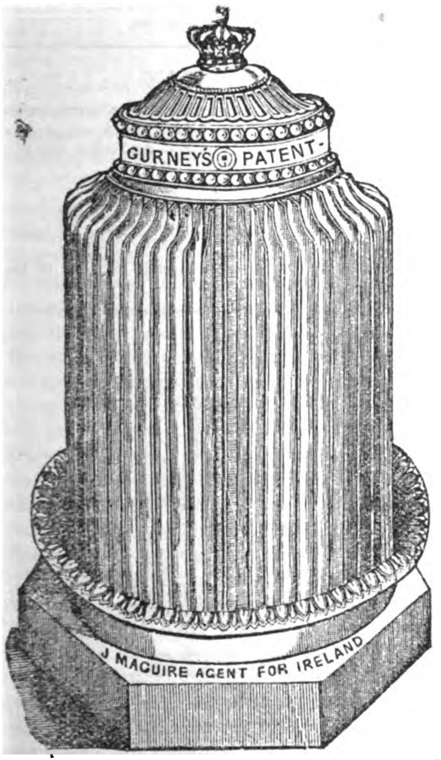
Sixth—Though last, not least—it effects a saving of 25 per cent.

Price 1s. 3d. each.

GREGG AND SON (Sole Agents),

LAMP MAKERS AND GAS FITTERS,

18, UPPER SACKVILLE-STREET, DUBLIN.



GURNEY'S PATENT
J MAGUIRE AGENT FOR IRELAND

GURNEY'S PATENT STOVES AND HOT WATER BATTERIES.

THE above are in successful operation in both Houses of Parliament, St. Paul's Cathedral, Kensington Museum, the New Museum, Royal Dublin Society; Birr Barracks, &c.; and may be seen at work in

JOHN MAGUIRE'S NEW WARKROOMS,

10, DAWSON-STREET.

He has all sizes in Stock suitable for Churches, Warerooms, Halls, and Institutions.

Agent for the following Patented Goods:—

Gurney's Stoves and Hot Water Batteries.

Whitfield's Fireproof Safes & Chests.

Brown's Improved Close Kitchen Ranges.

Eastwood's compound-action Churns from two to fifty gallons.

Simpson's Ice Machines and Freezing Powders.

Kent's and Worth's Knife Cleaners and Mangles.

JOHN MAGUIRE,
MANUFACTURING IRONMONGER,
10, DAWSON-STREET,
DUBLIN.

WATSON'S PATENT SELF-ACTING VENTILATOR.

VENTILATION WITHOUT VIOLENT DRAUGHT.

THE SIPHON PATENT VENTILATOR is to be had only of CHARLES WATSON, F.R.S.A., &c., the Patentee, at his Works, KING'S CROSS, HALIFAX, YORKSHIRE, and of

JAMES W. GATHERAL, 93, VIRGINIA-STREET, GLASGOW.

SIX THOUSAND of these Ventilators have been successfully applied to Churches, Schools, Factories, Dwelling-houses, Stables, Stores, Workshops, Warehouses, & Farm Buildings.

BUILDING GROUND at RATHGAR—between Kenilworth-square and Harold's-cross-road, near Roundtown—to be Let, at from 2s. to 3s. per Foot, Landed Estates Court Title, and 900 years' Lease. Apply to

BENTLEY AND SON,
110, GRAFTON-STREET, DUBLIN.

N.B.—A Quarry on the land, and bricks at half-price.

A FEW HALF-ACRE PLOTS at DUNDRUM for Detached Houses, within three minutes' walk of the Railway Station, to be Let cheap. Bricks and Stone on very moderate terms to parties building.

BENTLEY AND SON,
110, GRAFTON-STREET, DUBLIN.

BUILDING PLOTS at STILLORGAN, of One Acre up to Ten Acres, on the Lands of Foxrock, Galloping Green, and Kerrymount; Lease 900 years. Bricks, Stone, Sand, and Lime on the premises at very moderate terms. To be Let, at from £7 to £10 per acre, according to position. A new Station on the Dublin and Wicklow Railway will be established at Foxrock from 1st of September next also omnibus accommodation to and from Kingstown for bathing, shopping, &c.

Lithograpic Maps, showing the new sites, the new road, &c., can be had at our office.

BENTLEY AND SON,
110, GRAFTON-STREET, DUBLIN.

BUILDING GROUND, most desirably situated on the SORENTO-ROAD, DALKEY, to be Let, on a Lease for 900 years; also the ground at CLIFF-TERRACE, near SANDYCOVE, BULLOCK. The particulars of which may be known at the Office of JOHN LOUCH, Esq., 15, MOLESWORTH-ST., DUBLIN.

TO CAPITALISTS AND BUILDERS.

TO BE LET for BUILDING, the Ground round Wellington-square and in Hatch-street, the Maps and particulars of which may be seen at the Offices of JOHN LOUCH, Esq., Architect, 15, Molesworth street, Dublin.

BELMYRA, DUNDRUM, CO. DUBLIN.

TO CAPITALISTS, BUILDERS, & OTHERS.

MOST DESIRABLE BUILDING GROUND TO BE LET—This Estate, containing 150 Acres, situated within half a mile of the Dundrum Railway Station, has been laid out in Lots for Building. The position is admitted to be the most beautiful in the environs of Dublin, and is particularly well circumstanced in every respect, commanding views of Killiney Hill, overlooking Mount Merrion, City and Bay of Dublin, &c.

A railway station in the centre of the estate is in contemplation, bringing it within ten minutes' drive per rail of Harcourt street.

A map of the lands, showing them laid out in building lots, can be seen, and every information obtained, at the offices of Edward Henry Carson C E., Architect, &c., 25, Harcourt-street.

MR. ANTHONY, ARCHITECT AND BUILDING SURVEYOR,

BEGS to inform Architects & Builders that he practises as MEASURER, and flatters himself a long practical experience with works of magnitude throughout Ireland, affords the best possible guarantee for the correctness of his quantities

Builders tendering in competition will be treated with on moderate terms.

19, LOWER PEMBROKE-STREET, DUBLIN.

MESSRS. JAMES & EDWD. BARKER,

CONTRACTORS

To Her Majesty's War Department, and the Ecclesiastical Commissioners for Ireland.

All orders executed to satisfaction.

32, UPPER ABBEY-STREET, DUBLIN.

BLASTING GUNPOWDER AND SAFETY FUSE.

SAUNDERS AND GATCHELL are extensively supplied with the above by the first manufacturers.

8, INNS-QUAY (Four Courts), DUBLIN.

MESSRS. O'DUFFY AND EGAR, SURGICAL and MECHANICAL DENTISTS, may be consulted *free* at 75, DAME-STREET, opposite the Lower Castle Yard.

ESTABLISHED THIRTY-FIVE YEARS.

F. SURRIDGE (late of London), Manufacturer of Photograph Apparatus, Scientific Modeller, &c.

67, AUNGIER-STREET, DUBLIN.

Oils, Colours, Glass, &c.

MANNIN'S Wholesale and Retail DRUG, OIL, COLOUR, and GLASS WAREHOUSE, 2, GREAT BRUNSWICK-STREET.
(near D'Olier-street.)
Cattle Medicine of all kinds.
N.B.—Every article is warranted genuine, and at the lowest price.

Stained Glass,

FLAT LEAD WINDOW, & PATENT METAL SASH MANUFACTORY,
107 & 108, MIDDLE ABBEY-STREET, DUBLIN.

M. & R. SILLERY beg to inform parties requiring the above that they can supply them at much *Lower prices* than other houses, and respectfully invite an inspection of their patterns

ESTABLISHED UPWARDS OF HALF A CENTURY.

ROOM PAPER, in great variety, at MAURICE BROOKS', SACKVILLE-PLACE, Dublin.

JOSEPH O'LEARY, DECORATOR, Painter, Room Paper Manufacturer, and Dealer in Window Glass, and Laminated Lead for Damp Walls, No. 1, TEMPLE-LANE, Dame-street.

PLATE GLASS kept in Stock and supplied immediately, whereby the usual delay in ordering from the Manufactory is avoided.
MAURICE BROOKS, SACKVILLE-PLACE, DUBLIN.

Machinery, Patents, &c.

HAMMERSMITH IRON WORKS, DUBLIN.

MESSRS. TURNER AND GIBSON, Manufacturers of IRON CONSERVATORIES, Fruit Houses, Pine Pits, etc.

ORNAMENTAL WORKS, Bowers, Porches, Balustrades, Trellises, Flower Stands, Vases, etc.
GRAND ENTRANCE GATES, Guard Railings, Farm Gates, Hurdles, and Strained Wire Fencing, etc
IRON ROOFS for Railway Stations, Breweries, Gas Works, and Farm Buildings, etc.
WARMING & VENTILATING Dwelling Houses, Prisons, Conservatories, Mills, and Public Buildings, etc.; House, Laundry, Cooking, and Steaming Apparatus.
BRIDGES, GIRDERS, Iron Lattice, Bowstring, Suspension, Patent Balance Rolling, and Swivel Bridges, and Floor Girders

T. and G. beg to refer, as specimens of *their work*, to the Iron Conservatories, Heating, etc., as erected at the ROYAL BOTANIC GARDENS, KEW; the INNER CIRCLE BOTANIC, REGENT'S PARK; CHELTENHAM; VICEREGAL LODGE; GLASNEVIN; and various Works by them throughout the United Kingdom.

PATENTS FOR INVENTIONS.

INVENTORS are respectfully informed that the undersigned continue to procure Letters Patent and to Register Designs as heretofore during the last fifteen years, information on which may be had on addressing a letter or by personal application. BARLOW and CO., Office for Patents, 89, Chancery lane, W.C.

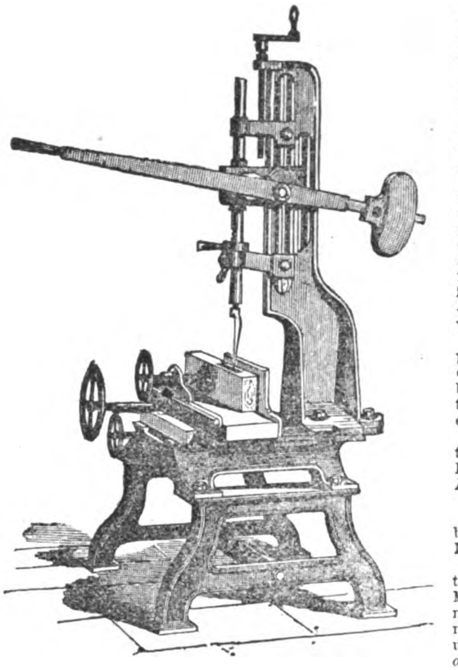
PATENT OFFICES and DESIGNS REGISTRY, *North West Chambers*, 4, *Lower Ormond-quay, Dublin; and* 47, *Lincoln's Inn Fields, London.* J. P. BYRNE, *Solicitor, Agent.*
N.B.—A useful Pamphlet, "Hints to Inventors and Designers," gratis on application.

FIRE BRICKS, of every description and size; Furnace Blocks, Flue Covers, Chimney Cans, Vent Linings, Gas Retorts, Sewerage and Water Pipes, Vases, Fountains; Balustrading; Fire Clay, ground and selected, manufactured at the GARNKIRK WORKS, near Glasgow.

A large Stock always on hand, and for Sale by
WILLIAM D. HENDERSON,
Agent for Belfast.
Fire, Life, and Marine Insurance Office,
42, Waring-street.

GALLON AND BEAN, LEEDS,

Cut & Wrought Nail Manufacturers, & Hardware Merchants,



RESPECTFULLY request all BUILDERS, CONTRACTORS, CARPENTERS, &c., requiring Mortising Machines, previous to purchasing, to examine and test *their patent combined Crank and Lever Machine*, which will Mortise (Tenon and Bore, if required) both Hard and Soft Wood, and is also adapted for Drilling and Punching Iron.

The superiority of this Machine over *all* others consists *in the substitution of a solid wrought-iron plate Crank or Eccentric, by which greater power is obtained, in place of cast-metal Rack and Pinion Wheel, the Teeth or Cogs in which are so liable to strip or break out*—in the direct and perpendicular action of the Lever and Crank on the Cutting Tool, and consequent diminution of friction—in being *stronger* and *less complicated* in its construction, and more *powerful* in its motion—in the *facility* of its *adaptation* to the various depths of material—and in its *non-liability to break* or get out of working order.

This Machine has now been adopted in preference to *all others* by some of the principal Builders in London, Glasgow, Edinburgh, Dublin, and Belfast, who will bear testimony to its being the most powerful and efficient yet made

For further particulars apply to the Patentees and Makers, GALLON, BEAN, and LUMB, LEEDS.

Extract from the Report of the Royal Dublin Society's Spring Show, 1859:—

"Gallon, Bean, and Lumb, Leeds, exhibited a very useful and complete Mortising Machine, which was highly commended."

N.B.—The Patentees respectfully intimate that this Patent extends to, and comprises Machines for Mortising by Steam and other motive power, as well as by hand: and makers and vendors of, or parties buying or using Mortising Machines, *are cautioned against any infringement*, as the patent right will be strictly maintained.

TABLE GLASS—FRENCH SHADES—WINDOW GLASS.

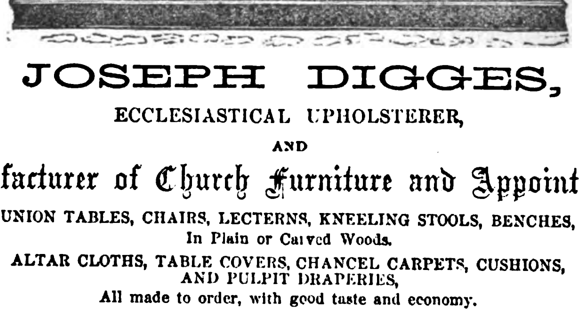
TO LARGE DEALERS, or Private Purchasers, requiring the numerous articles coming under those denominations, the Subscriber offers his fully-assorted Stock, the product of Manufacturers FIRST in their respective branches, at Prices not hitherto offered in the Market, meeting the wish and means of all.

JOHN CARRICK,

5, MARY'S-ABBEY,

DEALER IN ROMAN, PORTLAND, AND MASTIC CEMENTS, PLASTER OF PARIS.

N.B.—The attention of Nurserymen, Gardeners, and Amateur Florists is specially directed to the PROPAGATING GLASSES, etc., etc., with which he is constantly supplied.



DO THIS IN REMEMBRANCE OF ME

JOSEPH DIGGES,

ECCLESIASTICAL UPHOLSTERER,

AND

Manufacturer of Church Furniture and Appointments.

COMMUNION TABLES, CHAIRS, LECTERNS, KNEELING STOOLS, BENCHES, ETC.,
In Plain or Carved Woods.
ALTAR CLOTHS, TABLE COVERS, CHANCEL CARPETS, CUSHIONS, AND PULPIT DRAPERIES,
All made to order, with good taste and economy.

Blinds to suit every description of Church Windows Architects and others can depend on having their Designs carefully carried out.

27, LINCOLN-PLACE, DUBLIN.

(Opposite the Turkish Baths.)

The Dublin Builder.

VOL. II.—No. 14.

SCIENCE AND ART ESTABLISHMENTS.

The Museum of Irish Industry.

DUBLIN is lauded for the architectural beauty of her public buildings, but a visit to one of the scientific, artistic, or Industrial establishments which form an important proportion thereof, will convince as regards *them*, that "there is that within which passeth show," and that Ireland, though poor otherwise, is "rich" in elements conducive to national progress, if the people would avail themselves of the advantages at their command. Foremost, amongst institutions of this character, may be classed the Museum of Irish Industry in Stephen's-green, which each succeeding year since its establishment in 1845, has been progressively developing an extensive field for educational and industrial advancement. The premises devoted to the museum buildings comprise a frontage of about 130 feet by nearly 200 feet in depth, 3 stories in height exclusive of basement, and presenting an elevation with a centre and two wings—the latter subsequent additions, together with the galleries, each of which are about 130 feet in length by 24 feet in width, communicating at the extreme end with an admirably arranged lecture theatre about 53 feet by 45 feet, and at the other connected by a cross gallery and forming with same a quadrangle, from which they are lighted. A spacious and special staircase leads from each gallery to the story above—an arrangement unnecessarily occupying much valuable room, and capable of improvement by the substitution of a *central* stairs in the court-yard communicating alike with each wing—and principal and private staircases are also provided in the front building. On the principal story is a marble hall—approached centrally by a spacious flight of stone steps with areas on each side—and employed "for illustrating the application of Irish marbles to the purposes of decorative architecture;" an apartment of itself displaying forcibly what material we have *at home*, the various products being tastefully arranged in oak panelled wainscoting specially designed for the purpose, and which on examination will be found to stand a comparative test with many foreign imports, more fashionable, perhaps, but not one whit more beautiful, permanent, or useful. The other internal arrangements on this story comprise director's and clerk's offices, a library—though small—containing some most valuable scientific and artistic works for the use of the officers and professors, but to which the students of the Government School of Science are admitted under certain regulations during the session, and having an average attendance of 706 readers annually—also preparation rooms in connection with the lecture theatre. The galleries are denominated Lower North, Lower South, and Lower Cross, those corresponding on the floor above being distinguished as "the Upper." The first floor also comprises a Balance and Apparatus-room, Analytical Laboratory, and Geological Survey Office; on the second are various domestic apartments, stores, &c.; and the basement contains Laboratories, Chemical Apparatus and Lecture-rooms, &c., &c. So much for the building itself, which we must not omit to mention, was designed or adapted by the late Mr. Papworth, architect, we shall now offer a resumé of the contents interiorly.

Quoting from the prospectus we may premise that

"A principal department is specially devoted to the exhibition and illustration of building materials. Those form two divisions—first, ordinary building materials, in which are collections of building stones from all the important quarries in Ireland, with flags, bricks, slates, tiles, &c., so that architects from inspection of these materials can ascertain the nature and qualities of the materials available for building purposes in any given locality; second, decorative building materials, such as the rich and varied collections of the marbles of Ireland and the various artificial imitations of marbles, ornamental cements, tiles, pannelling, and papers, the applications of stained-glass to decorative purposes, alabasters, woods, &c., &c."

We learn that the public and the institution are deeply indebted for a large proportion of this beautiful and useful collection to Mr. George Wilkinson (late architect to the Poor-Law Commissioners), a gentleman distinguished for his practical and enquiring mind and uniform devotion to the cause of improvement.

In connection with this and the other departments of this museum, facilities are presented to architects, builders, &c., for ascertaining the best probable results from analytical observation by the Professor of Practical Chemistry to the institution—Dr. Galloway—who will be found courteously to respond to any call where his eminently scientific attainments may be available. Passing through the various galleries, we find them to embrace respectively Geological, Mineralogical, Botanical, Zoological, Palœontological, Metallurgical, Mechanical, &c., departments to which, however, we cannot hope to do justice by a mere cursory reference, and we are precluded from detailed description. Devoting ourselves, however, to a notice of such as come more immediately within the province of our readers, we observe that although

"The lower gallery—as named above—contains a variety of constructive material, such as the building stones of Ireland and England, &c., flags, slates, cements, marbles, porphyries, serpentines, &c. Some materials of this class, of too massive a character for this gallery, will be found near the staircase at the end of the lower south gallery."

Also that

"The application of stained and painted glass to decorative purposes is shown by the beautiful window presented by Mr. John Gibson, of Newcastle, and placed at the end of the north galleries; and also by that constructed by Messrs O'Connor, formerly of Dublin, now of Berner's-street, London, placed in the lower cross gallery, opposite the entrance from the hall."

Messrs. Minton & Co., of Stoke-upon-Trent, have the advantage of occupying a very conspicuous position in the same gallery for encaustic tile pavements, as usual beautifully designed and executed.

"On the north wall, are columns from the Giant's Causeway, on which are some specimens of basalt (Rowley rag) melted and cast by Messrs. Chance, near Birmingham; a sheet of rolled basaltic glass, &c."

"Under the stairs may be seen, on the north side, part of a granite vein, with its walls of altered silurian slate, from Killiney hill, procured through the kind instrumentality of Matthias J. O'Kelly, Esq. There are also some blocks of ornamental porphyry, from Lambay, presented by Lord Talbot de Malahide; a specimen of polished hornblende rock, from County Monaghan, presented by Lord Rossmore; and polished red granite from Barnesmore, County Donegal."

"Against the wall are arranged some large slabs of slate from Donegal and Killaloe, and a slate table, &c., from Valentia, presented by Mr. Blackburn, on the part of the Valentia Slate Company. Near the door of the physical preparation room, are a block and slab of white marble, from Dunlewey, Donegal."

Mr. Blackwell, referring to the mineral resources of Ireland, as regards iron, that invaluable product to every one engaged in constructive operations, in one of his lectures on the results of the Great Exhibition of 1851, says, "Whatever may be the mineral resources of Ireland, and they are by no means insignificant, at the present, moment no iron is produced there. Formerly she possessed extensive iron-works; in 1660, her production of iron was estimated at 1,000 tons, and there is scarcely a county in which iron was not anciently manufactured. In the north-east of Ireland blackband exists, apparently a continuation of the Scotch beds; its quality is said to be good, and quantity abundant. The north-west part of the island also possesses argillaceous ironstones, formerly worked at Arigna; but this district cannot bear competition with the iron-making resources of our English, Welsh, and Scotch districts. If the iron trade is *to be resuscitated in Ireland*, it will be probably from the working of hæmatites or magnetic oxides, both of which are known to exist in several localities along its coast; and in all probability will yet be found there more extensively, *when capital and enterprise* shall be directed to their discovery."

The words in italics bear a most significant meaning, and evidence, that, though mining operations in other ores have been and are being prosecuted with some vigour in Ireland—as may be seen in another portion of this journal—that which is above all others the most valuable for mechanical and general purposes is culpably neglected.

Amongst the models exhibited are those of a farm cottage by Dr. Fulton; reading-desk and pulpit, with geometrical staircase; patent Albert window, by Mr. Isaac Farrell (of this city) architect; various machines, statuettes, &c., &c.

We must here pause—though reminded that many other objects have escaped our notice, to which we may probably revert hereafter—to glance at the constitution of the establishment from which so much entertainment and instruction is derivable.

The Museum of Irish Industry was originated during the Peelite Administration in 1845, with especial reference to the reception of specimens during the progress of the Geological Survey of Ireland, and was for a time placed under the department of the then chief-commissioner of woods and forests, viz., the Earl of Lincoln, afterwards Duke of Newcastle; but in 1853, when the Earl of Carlisle—now Lord Lieutenant—became Chief-Commissioner of Works, and decided to extend its industrial objects, it was transferred to the Department of Science and Art, and again to the Committee of Privy Council for Education, under which department it is now consequently.

Under the excellent directorship of Sir Robert Kane, the eminent chemist and scholar, President of Cork University, whose name is so intimately associated with "the development of the resources of Ireland"; and comprising amongst its professors such luminaries in the scientific hemisphere as Mr. J. Beete Jukes, Drs Barker, Sullivan, Galloway, Harvey, and Kinahan, the faithful fulfilment of the Institution's mission could hardly be a doubtful question. Systematic courses of lectures on subjects connected with the various departments of the museum have been periodically delivered each session since 1844, for the accommodation of both day and evening pupils; and also in connexion therewith twelve of a popular character, in the Theatre of the Royal Dublin Society. Students can compete for the special certificates and prizes allotted to each course, and may register by payment of merely nominal fees. The session closes by an address from the director, when the public award of prizes takes place, usually presided at by the Lord Lieutenant. We notice by the report for the year 1858 that important donations, in porcelain and earthenware, had been received from the Science and Art Department, and of various kinds from other sources; that the total number of visitors to the museum was 23,818; competitors for prizes in natural philosophy, 3; general chemistry, 5; practical ditto, 14; geology, 4; botany, 2; zoology, 7; and general examination, 2; together with some other statistics unnecessary to detail. When the report for 1859 reaches us, we shall review the recent progress of the Institution, and trust that its future history may be distinguished by the same progressive advancement as hitherto. We must not quit the subject without tendering to Professor Galloway and Mr. George Penny, our acknowledgments for courteously conducting us through the various departments, and affording us every information requisite for this notice.

THE WATER-WORKS OF THE ANCIENT ROMANS.*

If the water was not perfectly pure at its source, it was introduced into one or more piscinæ or reservoirs before entering the city; and also, in the case of public baths, it was generally again submitted to the same process before being delivered for use. The principle of their construction is very simple. The water is introduced into a large covered space, broken into a number of compartments, through which it moves slowly, and thus has time to deposit whatever matters it may hold in mechanical suspension, and from which it issues, pure and limpid, into the specus. Some of the piscinæ appear to have consisted of two stories, one above the other; others consisted of only one story, as that of the Baths of Diocletian. The water drawn by the two aqueducts from the Anio was of course liable to be discoloured by rain, and on this account a *piscina limaria* was erected for each of them betwixt the weir, which diverted the water from the bed of the river and the commencement of the specus. Frontinus states, that six of the streams were received into six separate but adjoining piscinæ, so that each preserved its own level, at a spot about seven miles from Rome, on the Via Latina; and extensive substructions may be seen not far from the site thus indicated, but not in a state to be identified, nor to give any information as to their size or structure. Martial also speaks of a piscina as a swimming-place. The most perfect in Rome is known by the name of the Sette Sale—employed for the final purification of the water used in the Baths of Titus. Notwithstanding its name, this ruin consists of nine, not seven, long parallel vaults, with openings for communication from one to another, and these placed, not opposite to each other, but diagonally, so that the water had to pass through as great a space, and be brought in contact with as much surface as possible, betwixt its entrance and its exit. The tops of these openings have *pointed* arches, of which we only remember to have seen one other specimen of Roman work—viz., in the roof of the small aqueduct at Tusculum. The brick-work is very substantial, and the plaster several inches thick, of the finest lime and terra pozzolana, mixed with small fragments of brick or tufa, and so thoroughly hard that water could never penetrate it. A considerable deposit has been formed upon it while the piscina was in use, in some parts nearly one-fourth of an inch thick. Part of the height of the arches is now filled up with mud and rubbish, so that the original floor cannot be examined. The vaults are each 12 feet 4 inches wide, and at present 8 feet 6 inches high, and the middle vault is 136 feet 6 inches long. Those on each side of it become progressively shorter, as the inner end of the building forms a curve. Nibby, in his edition of Nardini, states, that there is another range of vaults, similar in every respect, below those now seen, and wholly filled up by earth and rubbish. There are four apartments, two above and two below. The water flows from the specus into one of the upper, falls into that immediately below, passes into the second lower, and rises up through it into the one immediately over it, on a level with the first, and then flows on by the specus, on the original level. The water, from the moment it was introduced into the specus, never saw the light of day until it was brought into the city and ready for distribution. In this respect it exactly imitated a natural subterranean stream and spring.

In this country it is common to commence the introduction of a supply of water into a town, by constructing an immense open reservoir, covering many acres of ground. Into this, dead and decaying animal and vegetable matter of every kind must find its way; there it decomposes, and furnishes food to myriads of microscopic plants and animals, and the larger Infusoria and Larvæ, which so greatly disgust water-drinkers in our large towns. Nor is this an evil which gradually abates: on the contrary, the longer an open reservoir exists, the more productive of minute life does it become. The accumulation of suitable food, both for microscopic plants and microscopic animals, goes on every day, and the organisms increase in proportion to the supply of food in a locality exactly suited to their nature and habits. Vitruvius, speaking of the specus, lays down the rule absolutely—"let them be arched over, so that the sun may on no account touch the water." This principle deserves our most careful consideration at the present day.

The aqueducts brought within the city walls were conducted, partly at once to the baths or other public places which they were intended to supply, but principally to the various castella aquæ, whence the water was furnished for the daily use of the inhabitants. The position of the castella was fixed by the level of the specus of each aqueduct, but the difference betwixt them within the city is much less than might be expected, considering the very different levels of their sources. The castella, then, were places where the water was delivered into a spacious basin, whence it was sent forth along pipes, to the localities and purposes, public or private, which it was destined to supply, but principally, so far as domestic use was concerned, to the lacus or public cisterns established in every part of the city. They were of two classes, either public or private. The great public castella divided the water into three separate reservoirs—one for the use of public baths, one for that of private houses, and the third for the public fountains; and this was so arranged, that when the supply was scanty, the least important might be cut off. From the castella the water was distributed to public and private uses under the charge of the *aquarii*. It is difficult, if not impossible, to ascertain the exact meaning of the details given of this by Frontinus; but the general principle seems to have been, that the water was turned on into each service-pipe by the aquarius, for a given space of time; and the size of the pipe being known, the supply of water given was ascertained—perhaps not very correctly.

Another very large demand for water was, to supply the balineæ. Of these the greater part were private, but a few were public, and of considerable extent, the immediate predecessors of the imperial thermæ. The private balinæ doubtless continued in use even after the erection of the public baths. Victor enumerates 1006, and as he gives the number of domi, or separate residences of the wealthier families, at 1780, it follows, that more than half of the *palaces* of Rome—if we may so translate domus—had each its own separate bathing establishment. A water-tax was paid by all who had private service-pipes, but we have failed to discover any indication of the amount. The water in the *lacus* seems to have been free to the public, or perhaps paid for by a general rate on houses. Frontinus placed bronze mouths on the ends of the water-pipes next the castella, to prevent the frauds of the aquarii by tampering with the pipes; and he placed all these calices on the same level, that each might draw off exactly the same quantity of water. The modern Romans have each about one cubic metre daily, most of which is employed for public purposes, and a very small quantity indeed for personal ablutions. If we allow a like quantity to the ancient Romans, it will very closely correspond with the probable number of inhabitants when Rome was in its glory, which we do not believe ever exceeded a million and a half.

---

* Continued from page 185.

The great and constant demand for water for public use was to supply the baths. These establishments form a very marked peculiarity in the social arrangements of the Romans; nothing at all resembling them is known to have existed in any other nation, in point of extent, of luxuriousness, or of injurious effects upon all ranks of the people. In some respects, the modern clubs of our great cities bear a very slight resemblance to the Roman baths Ruined fragments of Agrippa's baths may be traced in the Via della Ciambella, in the Academia di Teologia, in the Piazza Minerva, and in the Sacristy behind Sa. Maria della Rotondo. The noblest of all the remains of ancient Rome, the Pantheon, was, without doubt, originally built as a portion of these baths: it is proved by the contiguity of the other fragments, and by the identity of the style of the brick-work. It was turned into a temple by Agrippa himself, on which occasion he added the portico, of sixteen Corinthian columns of granite, each of one stone, 50 feet 9 inches in length, and 5 feet 9 inches in diameter. Thirteen of them remain as originally placed; the three on the east side are modern restorations. No other ruin in Rome impresses one so strongly with the idea of what the magnificence of the imperial baths must have been. This, independent of the portico, the finest specimen of Roman architecture, not equalled by anything ancient or modern now existing, was originally but one apartment—perhaps the entrance-hall—of the oldest public baths erected in Rome.

There is much sameness in the plans of the various ancient thermæ. The essential parts were, the calidarium, tepidarium, and frigidarium; or, hot, tepid, and cold baths. These, variously arranged, and with the necessary adjuncts, formed the corpus internum, to which, in the imperial baths, was added a corpus externum, containing many other buildings, for various purposes, and enclosing a vast extent of ground. The baths of Caracalla accommodated the inhabitants of the Aventine and Celian, those of Titus the Esquiline, those of Agrippa the Campus Martius, and Diocletian's the Quirinal and Viminal. The bathing habits of the latter Romans must have given full employment to all the sixteen establishments, for they were not content with one bath a day—many must have spent most of their time in the water. The infamous Commodus bathed seven or eight times a day, and took his meals in the bath. The virtuous Gordian bathed four or five times in summer, and twice in winter; and the profligate Gallienus six or seven times in summer, and twice or thrice in winter. Men and women alike frequented the baths, and under the empire, for a long period, bathed promiscuously together. Hadrian separated the bathing places of the two sexes, and also Marcus Antonius the Philosopher. Heliogabalus had countenanced the practice, and Alexander Severus again strictly prohibited it. The distinctions of rank, as well as of sex, were forgotten in the baths—emperors and subjects bathed together. Even in the time of Julius Cæsar, the mother of Augustus frequented the public baths; and the Emperor Hadrian bathed along with the meanest of his subjects. Alexander Severus bathed in common with the people, in his own or in the older baths, and walked home to the palace in his bathing-dress, having no mark of the imperial dignity, save a scarlet cloak. Gallienus refreshed not himself only, but all his great officers of state, by taking a bath along with them. One of the great halls of their corpus internum was converted by Michael Angelo into the church of Sta. Maria degli Angeli, in the form of a Greek cross; and in point of architecture and effect it is superior even to St. Peter's, though much inferior in actual dimensions. This church is adorned by eight magnificent columns of red granite, which still occupy their original positions in one of the halls of the baths; but the bases on which they seem to rest are modern additions—the actual bases are several feet below—and the necessary raising of the floor has greatly injured the proportions of the columns. Some of the finest pillars of modern Rome were obtained from these ruins—as those of Verde Antico, now in San Giovanni. Part of the building is occupied by hay-lofts, the vaulted roofs still remaining, and a portion has been turned into a poor-house; and one of the corner towers of the corpus externum is now the church of San Bernardo. It is said that many thousand persecuted Christians were employed on the building by Diocletian.

The water brought by the aqueducts to Rome was of different qualities. The Marcian was the finest; it was peculiarly valued for drinking, either pure or mixed with old wine. The Aqua Virginis was as much esteemed for bathing purposes as the Marcian for drinking. One stream, the Aqua Crabra, was introduced along with the Julia by Augustus, and afterwards expelled on account of its inferior quality; and hence it obtained the name of "Aqua Damnata."

Supplies of water in Rome were obtained by private individuals only by special grants from the emperor, and these were purely personal; they were not conceded to the dwelling, but to the individual, and they did not pass to heirs or purchasers—a fresh grant must be obtained. Even the surplus water which flowed over from the basins of the Castella could only be obtained by similar grant; and a good reason is given—that this water was required for the salubrity of the city, by cleansing the drains. It would be well for our large towns if this principle were fully adopted, and ample supplies of pure water poured constantly along the sewers. It was a serious offence in ancient Rome to commit any act by which water for public use was polluted.

Modern Rome is better supplied with water than any other city in Europe, the quantity introduced being very large, and of excellent quality. Indeed, but for its abundance and salubrity, Rome would be nearly uninhabitable at the present day. Three aqueducts bring into Rome the Aqua Vergine, Felice, and Paola. The quantity of water delivered by the Aqua Paola is estimated at 94,000 cubic meters, or nearly 1,000,000 of cubic feet, in the 24 hours, which is rather more than double the quantity brought by the Aqua Vergine and Aqua Felice together.

The system of drains in Rome was not less complete than that of aqueducts, but, from the nature of the works, only a small amount of information respecting them can be given. Buried originally beneath the streets and houses, they are now interred five times over beneath the accumulated ruins of sixteen centuries. Every one has heard of the Cloaca Maxima; it stands, from the Tiber up to San Georgio in Velabro, entire as when it was constructed, and to this day performs the duty of a drain. But was it really built for the purpose? Could the Tarquins have ever dreamt of Rome requiring such an outlet for drainage, or was drainage ever thought of in those days? Supposing the Tarquins knew the value of drainage, why construct a culvert large enough to contain the whole inhabitants of their capital? It has been conjectured that it was built by some unknown people, long prior to the foundation of Rome, and belonged to some mighty city, of which no other trace remains, either on the spot or in tradition. For whatsoever purpose, or by whomsoever it was built, it now stands a wonderful monument of durable masonry, and continuing, at all events for more than twenty centuries, to do the work of a sewer. Tarquin is said to have employed Etruscan architects to build it. The cloaca is in length, from the Velabrum to the Tiber, about 440 yards. It is constructed of three concentric circles of squared stones, put together without cement. The greater part of it is of lithoid tufa, probably from the Tarpeian Rock, which it closely resembles in composition and colour—a light brownish red. It is strengthened by diatoni of Travertine, at distances of 12 feet apart. The blocks of tufa and of Travertine are each about 5 feet by 3 feet. It is about 13 feet high, and as many wide; but 6 or 7 feet are now filled with mud and water, so that the lower part and the sole cannot be seen. The arch is semicircular, or very nearly so, and it would be instructive to know whether the lower part is flat or a reversed arch. If it prove to be the latter, it would help to explain the extraordinary durability of the work, notwithstanding the ceaseless action of water for more than 2,000 years, and occasional violent earthquakes. Its position, and perhaps its usefulness, secured it very much from the attacks of man. There is not much declivity along its course, for a very moderate flood in the Tiber completely covers its mouth, and causes its contents to flow back, so as to make it inaccessible at the upper end. Pliny states, that a waggon well loaded with hay could pass along it, and this is no exaggeration.

Between the mouth of the Cloaca Maxima and the remains of the Sublician bridge two other ancient mouths of cloacæ are visible—small semicircular arches, by one of which the Marrana (Aqua Crabra) now enters the Tiber. Though our knowledge of the cloacæ be thus limited and fragmentary, we think we are entitled to conclude, from what is known to exist, that it was every way suitable to the wants of the city, and adequate to the removal of its impurities, as well as of the water introduced by the aqueducts. In some respects, the more water poured through the drains from the aqueduct, the less trouble there would be in keeping them in order, and the more completely would they do their work.

We have thus endeavoured to give to the Institute some idea, though very imperfectly, of the water-works of the ancient Romans, —their aqueducts, reservoirs, baths, and drains.

Messrs. Naylor and Co., of Sheffield, have lately cast the largest steel bell yet made. The height is 5 feet 3 inches, diameter at the mouth 6 feet 2 inches, and thickness at the sound bow 4½ inches. The bell weighs 2 tons 12 cwt., or 5,824lbs., and is destined for San Francisco, where it is to sound an alarm for fires.

Improved locomotives are building at the Stephenson Works, Newcastle, for the Great Northern Railway, which are to burn coal. and consume the smoke. Meanwhile, the experiments instituted to achieve a smoke-consuming locomotive are still industriously carried on in the northern counties, with promise of success.

DUNDALK AND ENNISKILLEN RAILWAY BUILDINGS

THE terminus at Enniskillen, without being of pretentious character externally, as regards architectural display, is a neat, substantial, and, we will add, a *sensible* building—a term not applicable to many structures of the same class throughout Ireland. Internally the arrangements are commodious, and present every requisite for the important traffic which the line is sure to command. The buildings are divided into three portions, viz., a central structure 68 feet long, and two storeys high; and a one story wing at either side disengaged therefrom—a very wise arrangement—and presenting on the whole a range towards the roadway of some 170 feet. The booking-office is a spacious apartment, central in the main building, and approached from the street under a verandah. Communicating therewith is a parcel and left-luggage office and waiting-room at one side; and at the other a ladies' waiting-room, with ante off same, also a staircase leading to the master's and locomotive-superintendent's apartments, to which the upper floor is devoted. In each minor wing are respectively situated and approached from platform, first and second class refreshment room and special kitchen, also superintendent's office, porters' and lamp-room, store, &c. Every other requisite accommodation is provided in each department The railway, which is 62 feet 6 in. in width, is spanned by an iron roof supported on the side opposite to the station buildings by a flank wall presenting a series of brick semi-circular arches and piers, resting on a freestone base course.

The style of elevation externally is characterized by cantilever projecting roofs, segmental headed windows and doors with dressings, and partakes of Italian character. The materials employed for the general structure are hammer-dressed limestone from Carrickrea quarry, and the dressings are sandstone from Cairnsmore quarries. The expenditure was about £4,500. Mr. William G. Murray was the architect, and Mr. John Nolan, of Meredyth-place, Dublin, the builder.

The stations at Ballybay, Newbliss, Clones, Newtown Butler, and Lisnaskea, are all neat and commodious structures, built of stone from their respective localities, and sandstone from Cairnmore, for the dressings; Lisnaskea having the addition of red stock, string, or band courses throughout. The first mentioned of these is of Gothic character, presenting an elevation towards the public road of about 85 feet, 57 feet of which comprises the main building—a wing thereof being two storeys high, and containing station-master's apartment—and affording a spacious ticket-office, waiting and ladies' room, together with open entrance-porch. The cost of erection was about £1,700.

The Newbliss is somewhat similarly arranged interiorly, and in style slightly resembles. The cost of erection was the same as the foregoing.

At Clones the main building is of ┌ shape, two storeys high with cantilever roof and a one-story appendage in which are a ladies' waiting-room, and traffic-manager's office, porters' and lamp-rooms. Apartments on the first floor are arranged for the station-master. Cost, £2,500.

Newtownbutler station has probably more striking architectural features than the others, the style being early English, and presenting high-pitched roof, gabled dormers, barge boards, trefoil and Gothic arch-headed windows and doors with irregular dressings, quoins, &c., and an effective outline. The plan of two story building is ┌ shape likewise, and comprehends nearly a similar amount of accommodation to the preceding. Cost, £1,400.

Lisnaskea station is also similar in style, though differing on plan, and is partly two stories in height. Cost, £1,500.

All the foregoing works were executed from the designs of the company's architect (named above), and by the same builder of the terminus.

The items of cost particularized in each case are exclusive of extra works, which in some instances, owing to the nature of the soil, &c., are very considerable.

THE AIR WE BREATHE.—Although "trifles light as air" has become a proverb, yet air is positively heavy. A hogshead of air weighs ten ounces, heavier than the gas used for light, of which a hogshead would only weigh seven ounces A hogshead of hydrogen gas used for inflating gas weighs only two-thirds of an ounce. Every space of an inch square supports fifteen pounds weight of air, at the rate of ten ounces to a hogshead; the depth of the air is about five miles. Air is compressible, and that next the ground is made denser by that above it. At three miles high a hogshead of air weighs *five* ounces, at eight only *two*, and the limits extend to 40 miles.

THE ARTIZANS OF DUBLIN AND THE LONDON "LOCK OUTS."—The regular carpenters have contributed £50, the regular incorporated bricklayers a like sum, and the regular brick and stone layers £60, towards the support of their brethren in London against the masters.

Monthly Railway Memoranda.

For the present there is an end to the scheme for a railway from Downpatrick to Newry.

There will be no opposition by the County Down Company to the Holywood and Bangor railway bill.

The directors of the Dundalk and Enniskillen railway are prepared to receive tenders for the construction of the line from Clones to Cavan. Time limited to 21st inst. Mr. James Barton, C.E

The sum of £14,700, being the proportion of capital required by act of parliament to be lodged before applying to the legislature for a bill to legalize the proposed West Cork Railway, has been paid into the Irish Court of Chancery, and there is now every probability of the successful carrying out of the extension of railway communication in the west of the county. The presentment sessions give a guarantee on half the capital required for the construction of the line, which is not to exceed £6,000 per mile.

INDUSTRIAL DEPARTMENT OF THEATRES.

THE carpenter's shop is as busy a scene as the tailor's. The hammer and the saw are for ever sounding. "Flats" and "wings" are always being nailed into shape, and covered over with canvas, ready to go up to the painting-room. At the time of our visit, a being in canvas overalls, wearing a paper cap, and having a neat little saw in his hand, was busy cutting out the shape of some foliage, or, as the operation is called behind the scenes, marking the "profile." Carpenters in some theatres perform a great many duties which are not dreamt of in extra-theatrical shops. We knew a man once who had been at some time or other connected with nearly every provincial theatre in Great Britain and Ireland, and who called himself a carpenter, but he could do anything; he could form a scene, stretch on the canvas, and, if it was for a chamber, he could paint it. He also officiated as scene-shifter, and went on for "little business" at night. He could make properties, and did not disdain to act the part of a tailor or check-taker when required. Once or twice, upon emergency, he took a place in the orchestra; and with an accordion he has sometimes officiated as the whole band of a theatre rural. Yet for all his usefulness he never had a larger salary than sixteen shillings a week.

We may now leave the carpenter's shop, and visit the studio of the artist, which is situated at the top of the theatre. The painting shop is exactly over the back part of the stage, but it is a great way up. It is a long room, and is filled with a profusion of light, by means of a gigantic glass erection on the top of the house. In this chamber we see the artist at work on the back part of "the tranquil lake in the empyrean fields of balmy delight." The canvas is astonishingly large, but it is quite manageable, and can be lowered or raised to any required height or depth by means of slight machinery constructed for the purpose. The dexterity with which it has been painted is quite wonderful. The immense surface having been sized over, an outline of the landscape is traced out pretty boldly by the principal artist; then it is more minutely outlined in ink, and numerous portions of the design, originally dashed off on Bristol-board, in water colours; all the principal masses of colour are at once washed in by the assistant-brushes, but the finish conferred upon the whole is left to the principal artist, who executes it with a skill and power which will obtain we trust, the high encomiums of the critics of the Sunday papers, as well as the volleys of applause bestowed upon it by the "discriminating" audience who are always sure to assemble on boxing-night. The celerity with which business is carried on in this department of the theatre is quite miraculous, although, aided, no doubt, by the largeness of the canvas operated upon, which admits of a perfect army of brushes being engaged upon it at the same time, all directed, however, by the great master-brush of the establishment. A considerable portion of the labour in the painting-room is quite mechanical; for instance, straight lines for cornices, &c., are traced on the canvas by means of a tightly drawn piece of cord, rubbed over with dry colour, which is placed against the scene, and then pulled out, and let down again, when, of course, it leaves its mark. This and similar work can be done by a labourer or boy. This elaborate scrolled scene for a chamber in the tyrant's palace, is done by means of "pouncing"—that is, a small portion of the design is pricked out on a sheet of paper, which is held against the canvas, and then a bag of charcoal is dashed upon it, leaving, of course, the outline to be afterwards finished. This process is repeated till the whole of the large surface is covered, and when finally perfected, it looks very well indeed. When scenes are intended to dazzle and glitter, as is usually the case in a pantomime, they are daubed over with Dutch metal, the artist marking the places to be so done with a thinnish kind of glue; and the bits so prepared are either covered with gold or silver leaf as may be required.—*Chambers's Journal.*

An official Railway Handbook, for the Dublin and Wicklow Railway, suitably illustrated, is about being published.

THE WATER SUPPLY OF DUBLIN.*

THE CRISIS!

THE great pitched battle so long anticipated to come off between the "Cavaliers" of the Canal, the Lough Owel, the Dodder, and the Kippure supply schemes on the one hand, and the "Roundheads" of the "Coyford" proposition on the other, has been fought; and right earnestly was the struggle carried on by the combatants on both sides, as their *tattered* banners palpably show. For the present the latter have gained ascendancy, but the campaign is hardly yet finished; for they may rest assured that, unless their position is fortified to the extent the public are led to suppose, they will be subjected to perpetual attacks from without, which may ultimately overwhelm their citadel. There is a vulgar saying, but a very trite one, that "when rogues fall out, honest men come by their own," and though we are far from applying the term in its *literal* sense to the corporate members, either individually or collectively, it must be conceded that the animated—to use a mild phrase—discussions that took place in the Council Chamber on the 20th, 23rd, and 24th ult., have served to develop the faults and the possible ultimate responsibilities of *every* scheme propounded, and by which a prudent and foreseeing public may take warning in time, and secure to itself the *best* result. Our misgivings as to the capability of the Coyford proposition, both as regards *quantity* and *quality*, at certain seasons of the year, and the utter *impossibility of estimating* even a probable expense for all the necessary works to secure a supply from that source, the interminable and incalculable contingencies in settling with property owners whose interests will be detrimentalized by interference; and last, not least, the *little* items for a special bill, parliamentary expenses, fees to gentlemen of the long robe, &c., are already in the abstract before our readers, and we will not weary by repetition. But with all respect to the eminently qualified opinions of Sir John Benson—whose name is already associated most honourably with a successful enterprise of similar character—and of Mr. Dargan—whose competency to grapple with matters of calculation as regards expense of construction, or subjects for speculation, is universally acknowledged and appreciated — we still maintain our *own* opinion — viz., that the estimate laid before the house and the public is *insufficient* to provide against *contingencies*, in addition to the cost of the mechanical department. To ascertain the value of a perch of masonry, a foot lineal of piping, or a cubic yard of excavation, is a mere school-boy calculation; and by the same rule, with the assistance of an extended experience, the most important engineering or architectural undertaking may be calculated to a nicety, with scale and compass in hand, and the proper detailed data to work from; and that, too, in any quarter of the globe without moving from our studio chair. This, both Sir John Benson and Mr. Dargan must admit, and in such items we at once yield to, and repose confidence in, their opinions as expressed; but certainly not in *probabilities* yet to be developed by circumstances no human being *can* foresee, and each of which will draw more or less expenditure with it. How, then, the fullest possible rate of municipal taxation—viz., a *maximum* of 1s. 3d., or a *practical* one of *tenpence in the pound*—on the city valuation, to cover *all* expenses of the Coyford scheme for public and private supply, *can* be relied on, is to us a mystery. *If* the proposed works and all contingencies should happen to be amply provided for by this rate—and we sincerely hope, both for the character of the promoters and the public pocket, that they are—all honours and praises shall be showered on the triumvirate; but should they *not*, what will be the consequence? a position humiliated before, and responsible to, their fellow-citizens, for leading them by misrepresentation — however exonerated from wilfulness—into a secret entailing an annual pecuniary detriment on their own and their children's resources. Men of commercial status and capacity for business, such as Alderman Kinahan and Mr. Codd, are, doubtless, sensible of this, and so acute and clear-headed a tactician as Dr. Gray cannot but foresee how the result must tell either on the one side or the other. The final solution of this, however, is in "the womb of futurity," and until the conception is realized, *our* anticipations must remain mere matters of conjecture. That the canal companies have positively refused to guarantee, on *any* terms, a never-failing supply of ten million gallons per diem to the city, also that when advised of the municipal engineers' (consulting and borough) reports in favour of treating with them under extended and improved arrangements, and of the unlikelihood of available supply elsewhere, they *doubled* their *figures*, are notable facts. How far they were justified in either act, on business principle, or from philanthropic considerations — and their boards comprise many gentlemen distinguished in both capacities—is a question we will not *now* raise; but certain it is, that on their heads *also* a responsibility will fall—for depriving the citizens of their original *simple* supply source, and coercing them to seek another more expensive and difficult of approach—should the subsequent *dernier resort* scheme prove a failure, and more costly than expected. We are promised—but are not unmindful of something about "promises" and "pie-crusts"—by the proposed bill that we are to have from the new source better, purer, and more wholesome water, a full and sufficient supply at high pressure attaining a level of from 40 to 50 feet above the highest chimney-top in Dublin; that we shall be secured, within *two* minutes, a supply, in case of fire, for ten engines to pour upon a burning pile; that the estimate of £218,000 for the construction is ample; and that good and experienced contractors may be found to execute the works for that sum. This, perhaps, is the compendium and pith of the whole proposition, with the following

SYNOPSIS OF THE BILL.

1.—A weir to extend across the bed of the river Liffey at the site of an ancient weir called Coyford, partly in the townland of Halverstown in the parish of Carragh, and partly in the townland of Castlekeely in the parish of Bride's Church, all in the Co. Kildare.

2.—An aqueduct, conduit, or pipe, commencing by communication with the river Liffey, at or near the eastern end of said intended weir, &c., and terminating by a junction with the reservoir, &c., at Templeogue and Limekiln Farm in the parish of Tallaght, &c.

3.—A reservoir or filtering beds, &c., with all necessary approaches, &c., partly in the townland of Templeogue in the parish of Tallaght, and partly in the townlands of Limekiln Farm and Whitehall in the parish of Crumlin and Co. Dublin.

4.—An aqueduct, &c., commencing with this reservoir and passing thence in through or into several parishes in the townlands of Whitehall, Perrystown, Crumlin, Kimmage, Terenure, Portobello, Harold's Cross West, in the parish of St. Peter's, Mount Jerome, Cherry Orchard, and terminating in Upper Clanbrassil-street, in the parish of St. Nicholas, in the County of the City of Dublin.

---

* See page 178 *ante*, and previous numbers.

5.—A reservoir or reservoirs, &c., commencing westward of Ballyward Bridge (Liffey). and terminating eastward of Blessington Bridge in the parish of Blessington and Co. Wicklow.

Clearly the 78th section of the bill (which we append for the information of our readers) *does* give power, if necessary, to levy an additional domestic water-rate, but alleged by the promoters to be inserted "that the council might be empowered to borrow money at a lesser rate of interest than otherwise," a margin as likely, in our opinion, to be dangerous as the reverse, and for that reason open to strong and palpable objections, inasmuch as the Corporation, though making specious promises, may nevertheless protect itself at the expense of the citizens to an infinitessimal extent, and by crying *peccavimus* hereafter, carry out their purpose at *any* cost.

78.—If *at any time* there be a *deficiency* in the amount required to pay the interest on the mortgages and debentures issued under the recited acts or this act, it shall be lawful for the Corporation, and they are hereby required to levy such an *additional* domestic water-rate as may be necessary to meet such deficiency, and to no other purpose, and such rate shall be assessed upon the *same* person, and levied and collected in the like manner as "the Domestic Water-rate," authorized to be levied under this act.

The abolition of public fountains—for which nothing short of a general mania arose during part of 1858 and all of 1859, throughout the United Kingdom—is provided for by the 72nd section, as may be seen by the following:—

72.—The Corporation may close up, discontinue, and remove all or any of the fountains now existing, and supplied by them with water, within the borough of Dublin, and *may* construct and supply any number of drinking fountains which they may consider *necessary* within the limits of this act for the free purpose of the public.

Now are the citizens of Dublin placed in *this* position: they are to *assume* that abundant and good water *may* be supplied to them from Coyford; that the sum total of expenses *may* not exceed £250,000, to be repaid by them by a taxation of *ten* to *fifteen* pence in the pound, but *that if it do*, they *must pay* an additional rate; that the Corporation *may* or *may not*—just as they please—take down every drinking fountain in the city, for the purpose of coercing the landlords of houses set in tenements, &c., to introduce *water* therein, and be included in the rate. How the committee to whom the bill has been referred to consider in detail will deal with these items, is now the question, and we await the result.

MINING OPERATIONS IN IRELAND.

The accounts of the Mining Company of Ireland show that the Knockmahon mines (Waterford) have realised a profit of £8,949; the Luganure mines (Wicklow), a profit of £3,506; the Slievardagh collieries (Tipperary), a profit of £1,794; and the Lisnacon Dromskeha collieries (Cork), a profit of £185. The Ballycorus lead works show a gross profit of £2,259, but from this one-half, or £1,129, is transferred to the Ballycorus Improvement Fund. The entire gain, for the six months, on those adventures which have resulted in a profit is thus £10,515; from which are to be deducted £897 for loss on the Ballydehob mine (Cork), £326 for loss on the Ballycorus lead mine (Dublin), £211 for expenditure on the Imael lead mine (Wicklow), as well as some trifling sums on minor undertakings. The nett profit of the Company is £7,766, as compared with £6,044 in the corresponding half-year of 1858.

The Engineer to the Barramore Mining Company reports "that this mine has been in active working operation for better than four months, and the progress and results so far satisfactory. The situation, at the head of the valley of Glenmalure, is a good mining one, and the granitic formation in which it exists is celebrated for being the great lead producing district of the county of Wicklow. The lode is the same, continuing its course into the Barravore Hill, having passed under the river and valley westward. In the adjoining valley of the Seven Churches, and in the same range and formation, are situated the rich Luganure lead mines, the largest producing that mineral in Ireland. The character of the ore and matrix of the lode at Barravore are identical with both this and Glenmalure. Since the formation of the company, and their placing the management in my hands, the works have been unceasingly persevered in by me. The underground works of the former proprietary were chiefly of an abortive character, being confined to driving long adit cross-cuts through hard granite. . . . . . The staff, consisting of working agent, good carpenter and blacksmith, together with two masons engaged on the wheel-pit and crushing house, all reside on the mine, and the organization of the whole is now perfect and complete. The buildings, consisting of agent's house, stores, carpenters' and smiths' shops, offices, &c., together with eighteen miner's cottages, are a great acquisition on the property. Although they require to be put in repair, which is now going on, nevertheless they enable us to comfortably lodge the company's staff, and to have complete control over the work-people; add to which, they allow the directors to apply to the company to direct mining operations, instead of to building purposes;—these are all points that cannot be over-estimated."

NEW BUILDINGS AT CHATHAM.

EBENEZER CHAPEL—THE JUBILEE MEMORIAL.

(Communicated.)

For many years the Congregationalist Denomination of Dissenters in this town have been making successful exertions in raising and maintaining Sunday Schools; the number of their scholars being considerably larger than that of any other body of Christians in this part of the county.

To meet a want that had been felt, as well as to provide a memorial of thankfulness for what had been accomplished in the lapse of fifty years for the building of Ebenezer Chapel, it was resolved to erect a building which should serve as a central plan of gathering for the associated schools and in which each school might find, to a certain extent, a home. For this purpose some small houses in Meeting-House-Lane, adjoining the chapel, were purchased, and an architect was consulted as to the best means of adapting the site to the proposed object. The result is, the building to which we now call attention.

The exterior has an exceedingly bold appearance, but it would have been considerably increased if the ground-line had not been kept so high. We understand that many difficulties in reference to the level of the pathway in front of the building have been raised by our local Board of Health, and these appear to have hampered the architect in the treatment of the lower portion of the design. Its principal feature is a large room placed on the same level as that of the old school room, and is connected with it by the cutting away of the end wall of the old building; the dimensions are about 86 feet long, 83 feet wide, and 20 feet high. A gallery is formed along the whole length of one side, and is lighted very effectively at night by a sunburner in the centre of the ceiling. For ordinary occasions the two rooms are separated by a moveable wood screen; but, by its removal can be thrown into one large room, capable of accommodating 600 persons. Seven class-rooms are provided in different parts of the building and are intended for the separate use of the schools connected with the chapel, for holding meetings of past scholars and other special business that may arise. The rooms and passages are lighted with gas, and conveniences of various kinds are attached for holding the tea meetings and other assemblages.

The building was commenced in April last, and in May the corner stone was laid by Samuel Morley, Esq., of London, in the presence of a large number of the friends of the undertaking. The meeting was addressed by the Rev. J. S. Hall, the pastor of the church, to whose great energy the origination and prosecution of the work is due; the Rev. P. Thomson, M.A., of Manchester, the former pastor; and the Rev. Breton Hood, of London.

At the completion of the building the committee entertained the workmen employed, and on this occasion, it may be stated, that an opportunity was afforded of testing the acoustic properties of the room, and that the trial was very successful.

The formal opening took place a few days before Christmas, and the work is now in full operation. The whole appears to be a very sound, solid construction, and has been erected from the designs of Mr. John Young, architect, of 36, Lincolns Inn Fields, London. The builder was Mr. Alfred Stump, of Brompton, who has very ably carried out the intentions of the architect.

BROMPTON BARRACKS,

The Government intend building a new Officers' Mess Establishment at those barracks, and have accepted the proposals of Mr .Alfred Stump, of Brompton, the Government contractor, for the erection of same; the amount we hear is between £4,000 and £5,000.

FORT PITT.

The new Lecture Theatre here is finished; it was completed in two months from the date of the order. The superintending officer was Mr. Richard Louch, of the Royal Engineers' Department, and the contractor as before named.

MORE ABOUT HORSE PASSENGER TRAMWAYS.

We have been requested to publish the following correspondence—forwarded to us by the secretary to the company *interested as original* MSS., though discovered at the eleventh hour, and when going to press, *not* to be so, an act which speaks sufficiently for itself without comment—relative to the introduction of these tramways into our city and suburbs:—

Extract from Letter of Mr. Myers, Secretary Sixth Avenue Railroad.

"New York, 5th December, 1859.

"You are entirely correct in thinking that we take an interest in your tramway question, and sympathise with the effort to introduce them in the world. If consent could be obtained to the laying of horse railroads through your city and suburbs, you may rely on the advocacy and support of the present opponents. This has been the case on this side of the Atlantic; in this city it has been so in every instance: custom has sanctioned what, in the outset, the property-holders viewed with sensitiveness and distrust. The only difficulty here has been, and is, that the *entire success and profit* of the routes established have induced constant efforts to obtain additional grants. We have railroads now on the 2nd, 3rd, 4th, 6th, 8th, and 9th avenues. So popular are these roads become, that constant applications are made to our authorities for new grants, in many cases fillibustering on the rights of those laid down; and the feeling is produced to prevent *an excessive use of what is found so advantageous.*

"In the development of the city the railroads have done a great work. Up to their construction, in 1852, the only mode of transit was by lumbering omnibuses, over an uneven and jolting pavement. Now people go down to their business and return in the cars, the two-horsed seating 40 inside, and one-horsed 16 to 20. The growth of New York has been greatly aided by these facilities of travel. I have had charge of the railroad for five years, and am sure my conclusions are correct. With no other interest than a desire to see tested what I know must succeed, I hope that Sir Robert Ferguson, Colonel French, and Colonel Greville will carry the Irish Tramway Bill."

Extract from Letter of Mr. Pallas, of Dublin, Engineer to several Lines in Philadelphia.

"Philadelphia, 26th Dec. 1859.

"The figures in your Prospectus (City of Dublin County and Suburbs Tramway Co.), as regards Philadelphia, flattering though they be, are considerably less than what they really are. We have at present a horse passenger road running in opposition to a steam road, and paying very well, notwithstanding the disadvantage of some heavy grades of 1 in 20, and charging less than half price; proving most conclusively that horse roads can run in opposition to steam. That they can and will do a large and paying business, *even though an omnibus line would not pay*, we have several proofs in this city, especially on the Grey's Ferry Road, which did not support a single line of omnibusses, yet the R. R. *now pays* 18 *per cent. per annum, and the shares are* 120 *premium.* Your proposed roads will pay *incredibly well*, more especially if run through Kingstown, Rathgar, Rathmines, &c. Though I mentioned the matter to but few persons here, parties would be willing to build and equip your roads, taking part stock and part cash."

Description of the Depots of the 6th and 3rd Avenues, New York.

"The 6th Avenue Depot is a fine brick building, 2 stories high, with a front of 200 feet by 60 feet deep, the ground floor for offices and car house, the 2nd story finished for balls and public rooms. In the rear is a store 90 feet deep, basement for stables, upper floor for feed lofts and repair shops. The premises are 200 by 150, containing stabling for 400 horses and storage for 70 railroad cars.

The 3rd Avenue Depot was finished in Dec. 1857, built of brick and iron, a great ornament to the neighbourhood. Main building 3 stories high, front 200 by 50 feet deep, occupied by company for repairing-shops, offices, &c., remainder leased. In the rear is a low building, one story high, with basement, devoted exclusively to the horses; and the stalls in rows, between every two of which is an alley whence the provender is supplied to the mangers, wider passages running the whole length intersect the alleys like a subterranean village. An open span in the centre is reserved as the head quarters of the Litchers (harnessers) for the exchange of teams, these are driven up and down two inclined platforms communicating with the floor above. The centre of the main floor is enclosed with partitions for feed lofts communicating with the stables below through a large hopper, the remainder of the floor is fitted up for a car house and turning ground for those in service—this cost 175,000 dols. or £35,000. At present in them are 600 horses, 80 cars, and 20 stages, but room for much more. The stables were considered when built among the finest in the States."

The Renfrew and Glasgow Railroad, three miles long, has lately been changed from steam to a horse passenger one.

The cities of Quebec and Montreal are about having them, their relative populations being 60,000 and 80,000—not so large as Cork or Belfast.

In Ireland—Limerick, Belfast, and Londonderry are supporting them.

At present an agent of American capitalists is in Europe relative to their introduction to the large towns in England, Scotland, and on the Continent, the Americans taking most of the stock, having proved their working at home.

The Corporation of London, which in 1858 opposed tramways being laid in the city, have changed their minds, as seen by the report of Mr. Heywood, their engineer, in the *Times* of the 9th Dec.

DESTRUCTION BY FIRE OF ST. ANDREW'S PAROCHIAL CHURCH.

This building which—now that it is no more—is fully appreciated as an architectural achievement in some of its features, was destroyed by fire, resulting it is supposed from the overheating of a flue and the close approximation of the rafters thereto, after morning service on Sunday, 8th ult. The merit of its general design is attributed to the late Mr. John Hartwell, architect, to whom was awarded a prize of twenty guineas, and the entrance opposite Church Lane and the arrangements of the galleries and fittings to Mr. Francis Johnston, who succeeded that gentleman in the work, and superintended it to completion. Of the latter we hope to place a view before our readers in an early number, as they are well worthy of perpetuation. The following are a few particulars of the edifice according to Mr. Gilbert. In 1793, the church having become ruinous, the parish appointed a committee to carry its repairs into execution. The original foundation was so well built, that it was found unnecessary to take down the walls below the level of the windows. The Parliament of Ireland granted £500 in 1796, and £1,000 in 1799, to enable the parish to complete the repair of the church, and to make proper accommodation in it for the reception of the members of the House of Commons and their Speaker, when they should attend divine worship there. The pews and galleries, together with all the interior work, were executed by Mr. James Lever, of the North-strand, a contractor of eminence, and father of our Irish novelist. In 1802, the Earl of Hardwicke, then Lord Lieutenant, presented to the parish the large gilt chandelier which had belonged to the Irish House of Commons, and which has lately been transferred from the Church to the Examination Hall of Trinity College. The following estimate by the great Dublin sculptor, for the statue still standing over the entrance to St. Andrew's Church, illustrates the low condition of the fine arts in the metropolis of Ireland immediately after the Union:—

Estimate by Edward Smyth, sculptor, June 6th, 1803, for executing a statue of Saint Andrew, in Portland stone, for the new front of Saint Andrew's Church, seven feet high, according to model exhibited by him for that purpose, finding the stone, &c., &c., for	£118	15	0
He begs leave to submit the following mode of payment and time to consideration, viz., the sum of ten guineas per month, on account, to be paid for four months, in which time the statue will be completely finished,	45	10	0
The further sum of five guineas to be paid in hand for defraying all expenses of loading, carriage, stone-cutter, making a level base, and erecting the block, being about 3½ tons weight, ...	5	18	9
Balance in Treasurer's hands, ...	£51	3	9

"This proposal I think fair, as Mr. Smyth was paid the same price for figures of a similar kind, and the manner of payment I think satisfactory and convenient.—June the 7th, 1803.—Francis Johnston."

"The Imperial Parliament, in 1805, granted £6,000 to be applied towards completing the building of St. Andrew's Church, and the erection of a steeple and spire, the first stone of which was laid in April of the same year. The Dissenting congregation of Eustace-street accommodated the parishioners of St. Andrew's in their place of worship from 1793 till the church was completed and opened on Sunday the 8th of March, 1807, on which occasion the chief personages in Dublin attended, and the money collected amounted to £538 10s. 9d. The total sum expended on the rebuilding of the church and the purchase of an organ amounted to about £22,000. The church of St. Andrew, says Mr. William Monck Mason, "is of a circular form; its interior very splendidly decorated, but its exterior, together with its unfinished steeple, exhibits a strange heterogenous collection of architectural blunders; the humour of every one of its tasteless projectors appears to have been gratified by the introduction of somewhat of his favourite style; so much of its steeple as is finished is Gothic, executed in hewn limestone; the church is of brick; the entrance or porch of granite; the situation of every part is likewise misplaced; the church opens upon the street, so that divine service is perpetually interrupted by the noise of carriages; had the steeple been placed so that its lower part should serve as a vestibule, this most considerable defect in its construction would have been remedied."

OUR MARKETS.

"COMPARISONS are odious," no doubt, but nevertheless serve to awaken us sometimes to a deficiency which might probably otherwise pass unheeded. Comparing with other cities, attention has been specially directed to "pavement," "sewerage," "bridge accommodation," and "water supply,"—the latter agitation having attained a kind of European celebrity from the earnest and lengthy deliberations on the various projects mooted—but the sanitary arrangements and the convenience of the public as regards "Our Markets"—so palpably deficient in every possible respect—seems to be passed over as "a thing" not worthy of thought. If we have been taught a lesson elsewhere in sanitary matters—and surely all endowed with comprehension must admit we *have* and are *being* daily—can any deficiency be brought more home to us than in the arrangement of our *markets?* We boast of our spacious thoroughfares, our public buildings, our quays, as the noblest in Europe, our squares—even as a model for the British Babylon, but let us for the necessary elements of the outward man, retire to the shambles of the victualler and the stalls of the huckster or fishmonger, what a scene presents itself? We say, certainly unprecedented in the United Kingdom, in any city or town *one-fourth* the capacity and importance of Dublin. View some of the pettiest villages or hamlets in England or various towns even in Ireland, and they will be found to possess all the elements for facility of business on a scale suited to the requirements of the locality, and to the sanitary welfare of the inhabitants. An English market-house is a picture of cleanliness, of system, and suitability to its required purposes; *some* of the Irish are partly so—especially those at Cork—but in the second city of Her Majesty's dominions, "our dear, dirty Dublin," what a sorry figure is presented?—*No market at all!* is probably the better designation for the huddled shambles of the Cole's-lane, the Moore, Leinster, or William-streets animal food depots, where man and beast are alike regarded, where the dainty requirements of the one are indiscriminately mixed with the offal thrown to the other, where purchasers' nasal organs are at certain seasons submitted to an intolerable test, and they are compelled to transact their business under dripping eaves—where the necessary cleansing and other appurtenances are absent, where a breath of wholesome air is unknown, and where in warm weather, from the putrid stores within, poisonous exhalations are emitted to the detriment of the inhabitants of populous neighbourhoods. These are facts which to our minds cannot be contradicted; if *so*, we invite comment or qualification, and if *not*, the necessity at once suggests itself for a move in *that* direction, as earnest as in any other of sanitary tendency.

A correspondent of a local contemporary—rejoicing in the originality of his conception—suggests that a Covent Garden floral market should be erected in Dublin, but *we* think that the actual necessaries of life should be provided with a fitting receptacle before a crystal hall for horticultural display and fashionable lounging after Cockney style be thought of.

The state of our markets cannot much longer be tolerated, and as our municipal body numbers many members of philanthropic and practically useful minds, we earnestly direct their attention thereto.

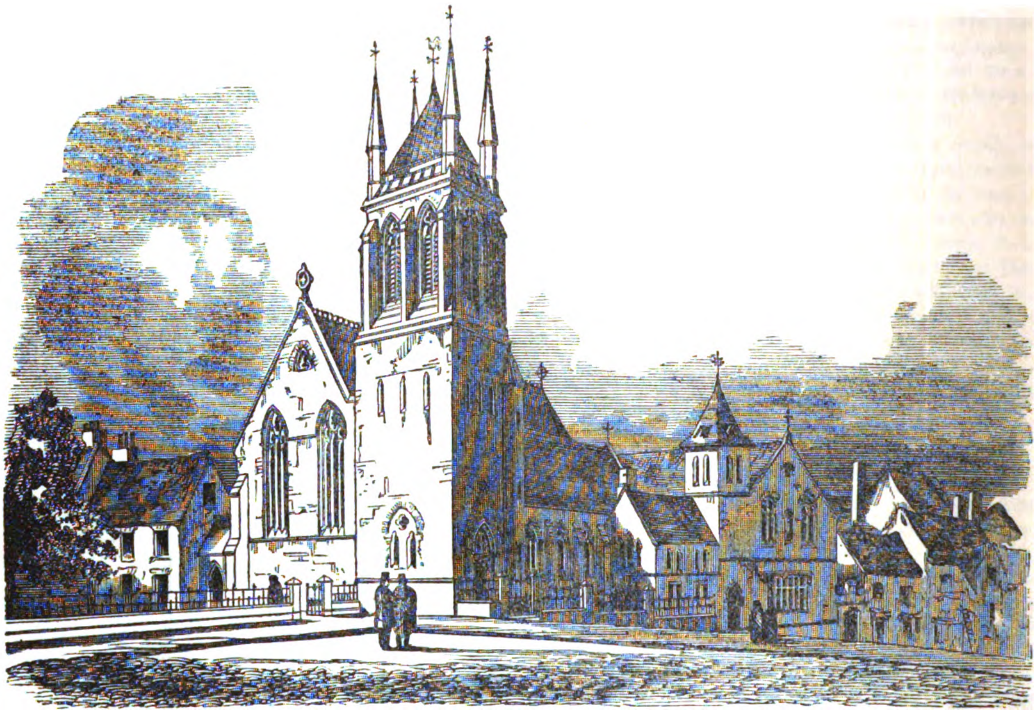
WATER WANTING AT THE NORTH SIDE.

IT seems to be a characteristic of our Corporate constitution to defer granting to the citizens the necessaries of pure water, effective sewerage, and good light, until the public voice with vociferous outcry demands compliance. Districts however improving, or likely to improve and become populous, are expected first to develop *themselves* fully, before any encouragement will be given by the provision of requisites for the inhabitants. This is an expectation contrary to common sense, as men will not build to any extent or speculate on general improvements in localities where a thirsty soul may not find the quenching wherewith, where open drains and stagnant pools send forth fœtid exhalations, and where, after sunset, an out-door essay is attended with much risk to life or limb. It is certainly a principle of progressing backwards, the policy of which appears very questionable, financially and otherwise. In the neighbourhood comprised within Upper Sheriff-street, Church and East-roads, and the Circular-road leading to the Wharf, and thence to the new Graving Docks, and other buildings of the Port of Dublin Corporation, are the elements for a new and important district, if the encouragement even of abundant water were afforded. On Church-road are domestic dwellings of three classes—two new cottages to rent at some £18 per annum are in progress of completion experimentally at the end next Wharf-road—various others are projected, and a resident has actually commenced the preliminaries for six others in same locality in a field where an open foul drain runs parallel with the road for a considerable distance. Not one drop of pipe-water is obtainable nearer than Sheriff-street Bridge—some half mile or so distant.

To complain of faults and not to suggest a remedy, is not our maxim, so we submit, that as the water is in Upper Sheriff-street, the main might at a small expense be continued by the Dock-yard-gate to the "Smoothing Iron"—where for the thousands who resort there in the summer for bathing, a draught of fresh water from a *public fountain* would be most palatable, and thence by the East-road to Church-road. From our own acquaintance with this locality we can vouch that even this one concession to *commence* with, would be a wise one, and ensure its growth. The more extended the city becomes, the greater will be the corporate revenue; and a deaf ear turned by its members to necessary improvements, must be accompanied by extreme blindness to public interests.

ALTERATIONS OF LIBRARY BUILDING, T.C.D.

THE contract recently entered into by the Board of the Alma Mater with a view of providing increased shelving accommodation in, and otherwise improving, the library, under the direction of Messrs. Deane and Woodward, has evoked some personal correspondence in the daily journals, wherein the architects are accused of Vandalism and unnecessarily tampering with the present edifice, &c., &c. The old library building consists externally of cut stone, the lower story being arcaded—and affording a spacious ambularium in inclement weather for the professors or students—and the upper presenting a range of architraved square-headed windows—the fenestration arrangement not quite in accordance with custom now-a-days—with rusticated piers between, and surmounted by rich Corinthian entablature which carries a continuous balustraded parapet. The library apartment is a noble one, probably the largest in the kingdom, being 210 feet by 41 feet, and 40 feet in height, with a richly coffered horizontal ceiling. We believe it was opened about the year 1593, having occupied two years in building. The rapidly accumulating collection of volumes, manuscripts, periodicals, &c.,—for there is an act of parliament requiring, under heavy penalty, that a copy of every publication in Her Majesty's dominions *must* be deposited in the British Museum, and Trinity College, Dublin—demanded increased space. To *lengthen* or *widen* or erect *additions* to the existing building, would necessitate a most material interference with the arrangements of the other buildings in proximity, and in fact may be pronounced an impracticability. But there was a *dernier resort* left viz., to procure extension upwards and without interfering with the present galleries by removing the ceiling, between which and the roof timbers existed a considerable space. We may also mention that the old roof having performed its duty for more than two centuries and a half was deemed a fit subject for retirement, and thereby an additional facility for achieving a double purpose was presented. The alterations now progressing comprise the removal of that ceiling, the substitution of a new cylindrical vault formed of semi-circular oaken ribs, and sheeted with planking of the same material following the curve; the construction of an entirely new roof, *exactly the same outline as before*—though alleged *not* to be so—and the adding of granite columns inside the ambularium central on the arcade piers, and affording both support for the oaken uprights on which the principals of the new roof are to rest, independent of the old walls, as also assistance to the present floors, which exhibited symptoms of instability. The library will be materially improved, and instead of being accused of Vandalism or even want of judgment, the architects have, to our minds, surmounted a difficulty most nobly. The columns are not of a classic order—in fact, they are of *no* order—and if there be a cause for regret in the matter, it is that they are not so; but, being placed internally, are comparatively unseen. They are, more properly speaking, square shaped, perfectly vertical antœ with chamfers on the arrises widening towards the astragal, continued up a bell-shaped cap and terminating in a point at the abacus. The expenditure will be £7,250, and Messrs. Cockburn and Son are the contractors.



ST. VINCENT'S CHURCH, SHEFFIELD.

MESSRS. HADFIELD AND GOLDIE, ARCHITECTS.

ST. VINCENT'S CHURCH, SHEFFIELD.

THE new church of St. Vincent of Paul was built during the course of the year 1858, the foundation stone having been laid on the 25th day of March same year.

The plan is devised to meet the peculiarities of the site, which is adjoining the schools previously built in White Croft. The church has two entrances, one being from Solly-street, the other from the top of White Croft.

The edifice consists of a nave—with an apsis for the chancel—110 feet long by 27 feet wide. On the north side is an aisle of irregular width, but averaging 10 feet, and abutting upon the works of Messrs. Spencer and Sons. On the south is an aisle 19 feet wide, and at the west end of it will be the tower, which is not as yet commenced.

Two sides of the edifice are more or less lost to view from the crowding of the adjoining buildings, but a large space is left on the west and south. The west elevation is particularly admired, from its loftiness and the elegant proportions of its lofty coupled windows· In the upper portion of the gable is an elaborate niche, containing a fine statue of the patron of the church, sculptured by Messrs. Lane and Lewis, of Birmingham, who have also done various carvings about the building.

The nave is separated from the aisles by an arcade of stone pillars, with moulded capitals, the arches being of fine red brick, with alternate stone voussoirs, and the label moulding of black brick. This admixture of stone and brick gives to the interior a character of decorative effect which is wholly structural, and so founded upon the truest principle of ornament.

The church is in the early decorated style, built of stone, in a solid and durable manner. The nave is roofed with a series of coupled braced rafters, so arranged as to admit of a pannelled ceiling to be hereafter added, and the chancel is defined by a coved and pannelled ceiling, and a rood beam supported by angel corbels, sustaining the crucifixion and the attenant statues of the Blessed Virgin and St. John. The apse is lighted by three two-light windows, to be hereafter filled with stained glass.

The nave is provided with strong simple benches, and the whole church admirably lighted with gas, and heated with hot water.

The chancel floor is paved with Minton's tiles. The altar is of Brodsworth stone. The tabernacle, reredos, and all the remaining furniture of the sanctuary are to be added as the means are provided. The south aisle is lighted by three-light windows with tracery, and over the altar is a wheel window, of good size and form, filled with stained glass.

The tower will be terminated by a steep roof, with a group of octagonal pinnacles at its base; all to be covered with lead, and terminated with metal finials. The belfry will be lighted by coupled windows, and the lower portion of the tower will be of the utmost simplicity and solidity. The door opening into it, will be however, deeply moulded with a richly sculptured tympanum.

The Architects are Messrs. Hadfield and Goldie, of Sheffield, and Parliament-street, Westminster, London.

ALL HALLOWES COLLEGE, Drumcondra, near DUBLIN.—Mr. J. J. M'Carthy, R.H.A., Architect.

ALL HALLOWES COLLEGE,

DRUMCONDRA, NEAR DUBLIN.

THE accompanying illustration is an engraving by Mr. Hanlon, from a photograph which has been faithfully perpetuated. This accounts for the extensive foliage in the foreground, as the point from which the view was taken is studded with beautiful trees. For the sake, however, of our "architect" readers we should have wished the beauties of nature to merge a little, and admit of the artistic features of this handsome quadrangle being better developed. The block has—by the courtesy of the President of the College—been kindly placed at our disposal.

The buildings at present erected form part of a general design which is being gradually carried out as the requirements and means of the college increase. They consist of the north, west, and part of the south wings of a quadrangle 220 feet square in clear. No part of the east wing has yet been taken in hands. The west wing, or entrance front, facing the Swords-road, contains the entrance hall and grand staircase in the centre, with porter's lodge. To the right of the entrance hall is the *Aula Maxima*, in which the great academical exhibitions of the college are held: its dimensions (exclusive of the gallery at the southern end) are 95 feet in length by 30 in width and 25 feet high; it is lighted by seven two-light traceried windows on the west side; one end is formed into an elevated *duis* for the reception of distinguished visitors. The principal entrance to the *Aula Maxima* is through three large doorways in the southern end, opening from a central cloister in close proximity to the church. Returning to the entrance hall, on the left is situated the General Reception-room which is 70 feet long by 30 wide. This room is also intended to serve as a museum of natural history, costumes, and antiquities of all countries, towards the formation of which several valuable contributions have already been made by former *Alumni* of the college, who are dispersed over every part of the globe. Through two pointed archways we pass from the central hall to the west cloister, which occupies the entire of the east side of the wing above described. The northern end of this cloister opens into the cloister which runs along the south front of the north wing. The principal floor of the north wing is occupied by the various study halls and class-rooms, such as the Sacred Scripture Hall, the Theology Hall, the Halls of Ecclesiastical History, Logic, Natural Philosophy, and Humanities, and the rooms of the College Debating Society. These halls vary in size from 40 to 20 feet long by 20 feet wide. The width of each cloister is 12 feet. The north wing also contains a large staircase for the use of that part of the establishment. The two upper stories of the west wing contain a central corridor 10 feet wide, lighted by large three-bay windows in the north and south ends, and by lantern lights in the roof. On either side of these central corridors are situated the President's-rooms, with those of some of the Professors and Students. There are sixty rooms for residence, including baths. &c., on both floors. The north wing being narrower than the west, has the corridors (which open into those of the west wing) on the north side; so that the professors' and students' rooms (numbering, in all, 32) face the south.

The greater part of the south side of the quadrangle will be occupied by the church, of which at present the choir and sacristies only are built. The choir is 80 feet long by 26 feet wide; the side walls are 30 feet high, and the roof of high pitch and open. The east window is of five lights with traceried heads: the windows in the south side are all of three lights, with traceried heads of various patterns. The demands on the college for increased accommodation for the students, and other pressing necessities, have hitherto prevented the permanent furnishing of the chapel or the introduction of decorations to any liberal extent. Temporary altars and stalls, of the exact dimensions of those which are to be permanent, have been erected, so that ecclesiastical order and discipline is perfectly observed in the several church services and ceremonies. A generous benefactor of the institution has erected a monument to the founder of the college, the late Rev. John Hand, in the usual place on the gospel side of the altar. Some mural paintings by Messrs. Barff and Co., ornament the east end. The design for the completion of this church, as shown by the drawing exhibited by the architect, Mr. J. J. M'Carthy, in the Royal Hibernian Academy last year, comprise an ante-chapel extending towards the west, and projecting about 15 feet beyond the front of the west wing, lateral chapels, and tower and spire. A cloister connecting that of the west wing with buildings to be hereafter erected towards the south, will be continued along the west front of the ante-chapel; and over the cloister will be an organ gallery. The west end of the church will be lighted by a large Catherine-wheel window.

The east wing will be, like that of the north, appropriated to class rooms, study halls, and the dwellings of professors and students. It will also contain the college library.

The fine old mansion, shown in our illustration, formerly known as Clonturk House, situated to the south-west of the new college, contains the present library, the refectory, and dormitories for some junior students.

The grounds to the east and south of the college are appropriated to the recreation and exercise of the students; and a little *capella* in Italian architecture, erected by the proprietors of Clonturk House during the last century—not as a chapel, but as a lounge—is now the last resting-place on earth of the deceased members of the college.

We believe an antiquarian spirit had some influence in selecting the name "All Hallowes."—The lands of Clonturk, or Clynturk (the site of the college), were a grange belonging to the ancient Priory of All Hallows, Dublin. They are frequently mentioned in the ancient registry of the priory, published by the Irish Archolæogical Society in 1845.

The entire of the new buildings have been built and finished to the perfect satisfaction of the Directors of College by Mr. John Conolly, of Prince's-street, Dublin.

MACHINE CARPENTRY AND JOINERS' WORK MILLS.

WE give this month a view of the extensive Saw-Mills lately erected at the North Wall by the Messrs. Martin, which we visited a short time since, and were so pleased that we considered the subject worthy of being presented to our readers as a supplemental illustration. The mills are for the purpose of sawing and working timber to suit the various requirements of the building trade, and we believe them to be as extensive as any in the sister country. We noticed that the machines were by Woorsam & Co., London; Forrest and Barr, Glasgow; and Robinson & Son, Rochdale; also that an Irish firm (Victor Coates and Co., Belfast) constructed the powerful steam engine and boilers. The facility of erecting buildings must be greatly aided by the application of machinery. These mills are capable of turning out daily within the usual hours from 12 to 15 hundred of cut deals, 60 to 100 tons of cut timber, and 20 to 30 thousand feet of prepared flooring and mouldings; and in the extension now making on the east side, additional machinery can be erected so as to accommodate the various requirements of the trade, ample available steam power being in reserve. A rumour has reached us that offers have been made to the proprietors for the purchase of the concern by a company—the formation of which is contemplated by some members of the trade—for the importation and sale of timber; whether this arrangement be carried out or not, we feel convinced that a more convenient locality could not have been selected for the erection of the mills, standing, as they do, close to the import timber wharf, and in the midst of every description of imported timber, with ample room for storage, presenting facilities for supplying our wants without seeking elsewhere, saving risk, expense, and consequent delay of cross channel freight, and at the same time giving employment to our local tradesmen.

PROPOSED NEW BRIDGE ACROSS THE LIFFEY.

THE project so long talked of, so frequently and so earnestly urged on public consideration, and as often shelved to bide its time, seems to be again on the *tapis*; but we apprehend it will *again* share the same fate as hitherto, till the memory of "the quay-wall tax" shall have vanished—till "the whinstone pavement *experiments*" be fully paid for, "the water supply problem" solved, and the tone of the public mind fully tested by *pecuniary draws*—till the existing bridges shall have been pronounced incapable of modification for *required* purposes—and till provision is made, by the construction of docks elsewhere, for the shipping now occupying that portion of the river—and last, not least, till the funds are forthcoming to meet the expenses.

THE DUBLIN MECHANICS' INSTITUTE.

WE are gratified to announce that harmony—not dissension, as heretofore—prevails in this establishment, and that the last Annual Report shows its financial position to be in a healthy state, "all liabilities having been discharged up to 31st December last, and a balance of nearly £50 remaining in hands." What a contrast to former years! We heartily wish it may continue to prosper, and as enemies often become sworn friends, that *all* will unite hand in hand, consigning the unpleasantness of the past to oblivion, and think and work for but one object—the advancement of the Institution. The lecture-hall has been much improved—and there is an alteration in the platform contemplated—under the directions of Mr. John Bourke, architect, one of its earliest members, and who has ever taken a lively interest in the well-being of the Institute.

RESTORATION OF ST. DOULOUGH'S CHURCH, COUNTY DUBLIN.*

Ever ready to chronicle progress, we feel pleasure in recording the effort now being made to preserve this ancient ecclesiological relic from dilapidation. To those who, previously to the introduction of railroads, travelled by the ordinary route to Malahide, these remains were familiar; but comparatively few now-a-days have an opportunity of seeing them unless impelled by antiquarian tendencies to the spot. Writers on the antiquities of Ireland have rarely omitted to mention St. Doulough's, but some only in such a casual way as to leave a very faint impression respecting its architectural merits. Ledwich, Grose, Miss Beaufort, Brewer, Colgan, Ware, and others, for instance, have each alluded to the building, but evidently without detailed investigation. In May, 1856, Mr. Sloane, C.E., architect, of this city, and now entrusted with the work of restoration, after a careful survey, prepared comprehensive drawings of the structure, which, with a lengthened paper on the subject, he submitted to the Ecclesiological Society of St. Patrick's. The Rev. Dr. Reeves, Vicar of Lusk, read another paper before the Royal Irish Academy in April, 1859, which aroused the lovers of antiquarian art to make a positive move towards the saving of this venerable relic from ruin. Subsequently an influential committee was organized, and donations liberally poured in, so that we soon expect to hear of practical steps being taken towards the development of this object.

Mr. Sloane's estimate for the necessary repairs is £143 16s., comprising the following items, viz.:—

Exterior, ...	£61	17	6
Cell, ...	16	11	6
Oratory, ...	25	17	0
Chamber over Cell, ...	7	2	6
Chamber over Oratory, ...	15	16	6
Staircases, ...	8	10	0
	180	15	0
Contingencies, at 10 per Cent,...	13	1	0
Total, ...	£143	16	0

A sum seemingly very small for such an important work; but the smaller the more available happily. To the present incumbent, the Rev. W. S. Kennedy, much merit is due for his exertions to accomplish this undertaking, and if others followed his example, the few ancient architectural relics Ireland can boast of would not be in their present neglected and deplorable condition.

Correspondence.

THE LATE FIRE IN LOWER GARDINER-STREET.

THE PROPOSED WATER SUPPLY.

TO THE EDITOR OF THE DUBLIN BUILDER.

Dear Sir,—We are told by the promoters of the Corporation Water Works Bill, now before the public, that a principal benefit to be derived from the new system is, that "if a fire occur, we can have within *two minutes*, not *two* or *three* or *ten* fire-engines pouring water continually upon it, but the pressure of the great city basins pouring a vast flood with great force upon the burning pile." This—without specially commenting on the actual merit of the proposed water scheme, from which, though differing on principle, I am free to confess has been ably and practically dealt with in some of its details by Dr. Gray and the other gentlemen constituting with him the subcommittee appointed by our municipal body—appear to me a palpable absurdity; for this reason, that be the supply ever so powerful and copious, it cannot, without extraneous aid—viz., proper organization of a fire brigade (which there is not) promptly to place in operation the mechanical appliances necessary to render the water available—of itself be of any service. I have been present at many fires in the city, great and small: I have both witnessed and heard various just complaints of deficiency of water, the late arrival of engines, and so forth, but never to the extent that I did on the night of the 21st inst., when the fire broke out in No. 96 Lower Gardiner-street, and when there was abundance of water *twenty feet* distant, but *no engine* to work it. Happily the consequences were comparatively trivial, but they *might* not have been so, and considering that there was a heavy gale of wind blowing at the time, the result, however fortunate, seems providential and mysterious. At ten o'clock, or thereabouts, the alarm of "fire" was given, and after a short interval *one*, *two*, *three*, and subsequently more policemen arrived. Delay arose in procuring entrance, but when effected the first step was to open the hall door wide, as also the *two* drawing-room windows. Under *any* circumstances I need scarcely dwell on the injudiciousness of such a course, but with a positive storm to fan the flame, the proceeding was (to say the least) most stupid and ill-timed. The trimmings of the two-pair front window were on fire, the squares of glass gave way one by one, and each gust of wind acted more powerfully with each additional vent; now all this time, while the police were within, confusion seemed to reign amongst those without—no one seemed to have his proper duty defined, and each looked to his fellow to do the needful. St. Thomas's and St. George's parish engines were sent for, but neither were to be had; and until the police within, assisted by a chimney sweep named "Foley," who volunteered his services, literally tore every atom of burning woodwork from the window and thereby arrested the progress of the fire more extensively, the consequences appeared to be most seriously questionable. All this time, though the fire-plug was turned on and yielded an abundant supply, no engine was to be seen, nor did any arrive until fifteen minutes past eleven o'clock—*one hour and fifteen minutes* after the fire originated, and in which period the house might have been reduced to cinders. Here then was no lack of water; and if ten times as abundant a supply were obtainable, of what avail could it be without the hose and the engines?

A Beholder.

THE TIMBER MEASUREMENT QUESTION.

TO THE SECRETARY OF THE BUILDERS' ASSOCIATION OF IRELAND.

Sir—My attention has been called to a report of a meeting of the Builders' Association, held on Monday, the 9th instant, at which the following resolution, amongst others, was passed:—

"Resolved—That Mr. Barcroft, the present measurer, be called upon to state his opinion relative to calliper measurement, and to what extent it affects the purchaser in contradistinction to string measurement."

In compliance with the above resolution I beg to say that, in accordance with my experience, which extends over a period of 25 years, I have found a difference in favour of the string, of from 5 to 25 per cent. to exist, according as the timber was well squared or wany; and I fully agree with that part of Mr. Chaloner's letter wherein he states that it is necessary to have a sworn measurer to act between the merchant and the purchaser—for during my experience, I have found many frauds attempted to be practised by unprincipled parties, and especially upon public companies. The purchaser is not generally aware, however, that he has the power to call upon the measurer to examine the merchant's account, in order to see that the measurement of the timber for which he is charged is correct or otherwise, yet such is the case. However disposed I may be to agree with most of the remarks contained in Mr Chaloner's letter, I cannot but think we ought to be able to settle all our differences amongst ourselves, and with this view I would propose that a deputation, consisting of builders, retail timber merchants, and cabinet makers, should wait upon the Messrs. Martin and lay this matter, and their views upon it, before these gentlemen, when, I have no doubt, an amicable arrangement will be the result. The Messrs. Martin have already stated in their circular that any of the trade wishing to purchase according to the old arrangement would be so dealt with, and in either case I will be the measurer to stand between them and the purchaser. It is undoubtedly the interest of all parties concerned that the timber trade should be kept in the port of Dublin, and to effect which a sound and friendly feeling should exist between the importers and the trade.—I am, sir, your obedient servant,

J. Barcroft.

42a, Brunswick-street, Jan. 13, 1860.

Liverpool, December 27, 1859.

Dear Sir—The profession or trade of a timber measurer is not to be made light of because "a shilling per load" might be saved by disregarding his services. The integrity of the timber market is most immediately connected with the independence and skill of its port timber measurer, and his employment cannot be dispensed with without injustice resulting to some interest. Indeed the function of a timber measurer is practically to define the customary usage of the port, and so lead to and enable the importer, dealer, and consumer, respectively, to avail themselves of honourable and fair dealing. The art of measuring timber, in any well-regulated community, is as needful in practice as any other branch of skill, and has the like right to its share of patronage and remuneration, while honesty and common sense alike demand its conservation, for the general good of the community. In Liverpool, for a long series of years, calliper measure was unknown (except in the collection of duty), and though now used as a freight measure on all colonial and Baltic firs, its use has been successfully resisted up to the present time, and very justly so, for calliper measure is just only between the importer and shipowner, as determining the space occupied, whether the logs be sound or rotten, well squared or wany; and its use, even for the exaction of duty, is more on the ground of expediency than justice. To charge the consumer by calliper measure is at variance with fair dealing, simply because by calliper you charge the buyer with a quantity beyond that which you deliver to him, and this is contrary to the usage of all trades, where more of an article is *usually* delivered than is charged for, but never less. For instance, you hear of thirteen to the dozen, but *never* two, or of six score to the hundred, but *never* four; and whether in the case of discount or measure, there is always something in favour of the buyer. It has been the common law of England, that a man could not vend any article as of a measure or weight greater than that actually sold. Every schoolboy has learned tare and trett. Now, apart from the usage of trade, no article requires cutting more than wood, and even when cut up, sawn fir is divided into four qualities; how much more necessary is this classification when the wood is in its raw or unsawn state, and some logs very defective, some perfectly sound, or some exactly squared, and others comparatively round? The acceptance of timber solely by calliper measure would lead to very many abuses, fraudulent representations, ill-squared logs, or logs nearly round. The calliper, beyond its use for masts and spars (because used in the round), was an instrument unknown for the measurement of logs in England until the introduction of a war-tax, where it appears to have been introduced among the custom officers for the sake of simplicity and uniformity. So important was the art of measuring considered here, that not only did it require, as now, an apprenticeship to learn it, but measurers had to be sworn by the Corporation before they were qualified to act. The trade of timber measurer is yet one of the most important in this port, and certainly in no trade are there greater opportunities for dishonest practices as regards measure, as well as representation and manufacture, and the best check on these is in the employment of the disinterested and responsible measurer. The difference between string and calliper measure of timber varies so much, averaging, as it does, from 5 to 25 per cent., that no buyer can judge sufficiently close to enable him to regulate the difference by price only. The port of Dublin, which has hitherto given to its cabinet-maker a larger tare on wood than is obtainable in any other port of the United Kingdom, seems inclined henceforth to exact from its builder payment on fir, not only without any tare whatever, but absolutely to make him pay for what he does not receive, and this to the extent of nearly 25 per cent. as an extreme case. This is justice to an Irish capital with a vengeance, and yielding tare after an "Irish fashion." The Scotch are very practical, and string measure, and not calliper, rules all sales of fir, whether in Leith or Clyde.

---

* For a detailed description of this edifice see page 71 ante.

E. Chaloner.

Dublin, 13th January, 1860.

Sir—The letter of Mr. E. Chaloner, in the *Freeman* of 11th inst. on the subject of timber measurement, requires a little explanation; and as the parties who got that letter written and published have not thought fit to afford it, I will endeavour to supply the omission. In the first place, Mr. Chaloner is a Liverpool timber broker, and of course, as such, takes a great and unselfish (?) interest in the Dublin timber trade; and further, Mr. E. Chaloner is a Liverpool timber measurer, and very naturally has an aversion to a change that would dispense with his services in this respect. In the possession of these facts, the public will be enabled to judge of Mr. Chaloner's independence and impartiality on the subject on which he writes, and how far his statements may be biassed by his interests. Mr. Chaloner speaks with authority on the functions of a timber measurer, and as he both measures and sells the timber to the trade, he must know what protection he affords them. Still, with all deference to Mr. Chaloner, I do not think any interest would suffer, except the measurer's, were his services dispensed with; and I am of opinion that the Custom-house officer, who measures by calliper, and who is independent of all parties, is quite protection enough as between merchant and trader, without the intervention of a second measurer, the expense of whose duties falls on the trade. Parties not in the trade may naturally suppose that the change from string to calliper is an innovation, and not in general practice, on reading Mr. Chaloner's letter, while the fact is, timber is sold by calliper in all the Irish markets, and in London, Bristol, Hull, and other principal English ports, except Liverpool. Mr. Chaloner's ingenious remark about the Scotch being very practical, and buying their timber by string, if it has any meaning, amounts to this, that the traders of London, Bristol, Hull, Cork and Belfast are not so, and that the good sense of the United Kingdom, as far as the measurement of timber is concerned, is confined to the Liverpool, Leith, and Clyde markets. Does Mr. Chaloner hold this opinion?

I am at a loss to know what are the "many abuses and fraudulent misrepresentations" to which the adoption of calliper measure in the market would lead, and cannot understand how it would make logs of timber either "ill-squared or nearly round;" while very little experience would enable any one to estimate the difference in the value of timber according to the measure by which he buys it. Mr. Chaloner's sneer at things done after an "Irish fashion" was a fitting wind-up of the statements he has made for the information and instruction of the builders of the "Irish capital," in a style which, I am glad to say, has nothing Irish about it, and has, no doubt, afforded unbounded satisfaction to those who elicited it. Mr. Chaloner is not to be blamed; he is only attending to his business, which is, to try and divert, still more, the trade of this port to Liverpool.—I am, Sir, your faithful servant,

One in the Trade.

[At a meeting of the Shipbuilders of the Port of Liverpool, held on the 26th ult., Mr. Thomas Royden in the chair, it was resolved that, "by the *old-established Quay and String* Measurement of the Port *only* will we, the undersigned, hereafter buy and consume any imported logs of wood."—Signed, Thomas Royden and Son, Clover and Royle, Cato, Miller and Co., R. and J. Evans and Co., Chaloner, Hart, and Sinnott, T. and R. Clarke, jun.]

TO THE EDITOR OF THE FREEMAN.

Liverpool, 21st January, 1860.

Sir,—Through an anonymous correspondent you did me the honour in your impression of Saturday last of naming me as "a wood-broker and measurer," no fewer than *eleven* times. To this letter I do not deem any reply to be needful, but content myself with stating that, in the above capacity I was on the Thursday and Friday of last week employed by the importers of Liverpool, to sell by auction six cargoes of first-class woods, in the measurement of which, if reckoned by the Custom House *calliper* measure, every third foot was yielded as tare to the buyers, of whom there were no fewer than 110; and I beg to inform the timber trade of the United Kingdom in general, and Ireland in particular, through your columns, that these auction sales of imports are here of periodical recurrence, and that the next will take place on the mornings of Thursday and Friday, the 2nd and 3rd of February, 1860, commencing each day at eleven o'clock, agreeable with an advertisement which appears in another part of your journal. Catalogues are available for reference.—I remain, &c., Edward Chaloner, Wood-broker.

Notes of New Works.

METROPOLITAN.

Among the many building improvements of a domestic class proceeding in our city, we must not omit noticing the house, No. 2, Merrion-square East, the residence of James Tyrrell, Esq. It has undergone considerable improvements, the height being increased two feet, newly roofed, and a granite cornice frieze and blocking on front, plate-glass windows, handsome balcony, &c. The hall entrance is by a spacious flight of moulded steps of Ballyknockin granite, with massive iron railings at the sides and round area. The doorway has a portico with columns and pilasters of polished Aberdeen granite (the first of the kind used in the city); the entablature is of Irish granite. The interior of the house has been considerably improved and decorated, a splendid vestibule being the principal attraction, which is on the first landing of the staircase, and upwards of 30 feet long by 10 feet wide, having a range of Corinthian columns and pilasters—with carved pedestals—on each side; the spaces between being filled with stained-glass windows (supplied and fixed by Mr. Gibbs, sen., of Marylebone-road, London) representing Poetry, Music, and Drawing, with mirrors on the opposite side. The approach to the inner vestibule is by marble steps, and is lighted by a glass dome, the open being enriched with a stucco frieze and a foliage of oak. The ceiling is a splendid specimen of stucco-work, having a full Corinthian cornice, and the ceilings are divided with enriched panelling. The floors of vestibule and halls are splendid, laid in various patterns of Maw's encaustic tiles. The architect of the foregoing is Mr. E. H. Carson, and the works have been executed by Mr. Saml. H. Bolton, builder, of Richmond-street; the painting and decorating by Messrs. Sibthorpe and Son. The expenditure was about £3,000.

The Messrs. Lovely are about erecting a very extensive covered timber-yard in Poolbeg-street. The roof, of 50 feet clear span, in iron, has been designed by Mr. Sloane, C.E.

A large corn store, 250 feet in height and 55 in width, and roofed with timber ring post trusses, with four lofts, is to be built at Wapping-street, North Wall, Mr. Louch, architect. Owing to the slob nature of the soil, the foundation will be 10 feet deep. The expense will probably be £6,000.

Tenders are in preparation for a house at Victoria-terrace, Sandymount, for Francis Salmon, Esq. Mr. Sloane, C.E., Architect.

An asylum has been recently completed at New-street, after plans furnished by Mr. Joseph Maguire, architect; Mr. S. H. Bolton, the builder. It is designed to accommodate twenty-six widows; is of plain but substantial character externally, and its internal arrangements are commodious and suited to the required purposes. This structure has been erected at the sole expense of Alderman Atkinson, at a cost of £1,000, to commemorate (as we learn) his year of Mayoralty, and forms another link in the chain of philanthropic acts which has distinguished the worthy alderman, and is worthy of imitation by those who succeed to the honour of the civic chair.

Several villas are about being erected at Leeson Park, near the site of the new Molyneux Church. Mr. Sloane, C.E., architect.

Preliminary arrangements for the erection of the new Augustinian Church at John-street are so far progressing that operations will shortly commence, and we understand that designs will be invited from architects in competition.

The house No. 81, Grafton-street, which fell some time since, is being rebuilt by Messrs. Hopkins, to add to their adjoining premises. The front will be of decorative character from designs by Mr. Burne, architect. Mr. J. H. Bolton is the builder.

Extensive improvements are in progress on the demesne of Friarstown, for Captain Baily, under the superintendence of Mr. John S. Sloane, C.E. and Agricultural Architect; also large farm-offices, including houses for various machines and farm implements. These will be driven by a turbine, or horizontal wheel, on the principle so successfully applied by Mr. Sloane, in situations where economy of water is an object. The turbine will be supplied from a large reservoir, or catch water basin, which is intended to receive the water from several fields in progress of being drained. The waste water, after doing its duty in the turbine, will be used for irrigation, and other works of a useful character. In the same demesne is being formed a very fine fish-pond, which will, from its ornamental character, add greatly to the picturesqueness of the estate. The contractor for the various works is Mr. Aaron Laughlin, builder.

Various artificers' works are to be performed at Portobello Barracks, Dublin, from 24th inst. to 31st prox. and tenders are required for same.

PROVINCIAL.

A new place of worship, for the Primitive Wesleyan Methodists, has been erected and opened at Tyrone. The building is said to be chaste and beautiful.

A site has been selected on the South Mall, Cork, for the proposed Protestant Hall, and the owner, Miss Howard, has presented it to the promoters.

A new convent is to be built at Mountmellick according to designs by Mr. John S. Butler, of Dublin, architect.

A handsome dwelling house is to be erected at Dundrum, County Down, on the property of the Marquis of Downshire, according to plans, &c., by Mr. Henry Smith, architect, Downpatrick.

The Grand Jury, Co. Longford, are about erecting an iron lattice bridge at Scrabby, on the road from Granard to Arvagh, with other works in connection therewith, for which they are prepared to receive tenders up to the 18th inst.

A gallery is about to be constructed at Banagher Presbyterian Church, according to designs by Mr. Fitzgibbon Louch, Architect and C.E., Derry.

Lord Lorton is about to place in the church of Ardcarne (now rebuilding) a Memorial Window, to the memory of the late Viscount and Viscountess Lorton. It has been ordered in London, and will cost about £200.

A commodious parochial house is being completed at Edenderry, and the Marquess of Downshire has given £30 subscription.

The new convent of the Sisters of Mercy, Roscommon, is being completed.

The Gothic chapel recently erected at Carrick-on-Suir for the Christian Brothers, is a neat building, and contains a handsome stained glass window by Messrs Casey, Brothers, of this city.

St. Patrick's new Catholic Church at Gargary, Dolly's Brae, has been erected under the direction of Mr. W. J. Barre, of Belfast and Newry, architect, who, as already stated in the *Dublin Builder*, took the prize in the Ulster Hall competition, It is in the Gothic style, designed to accommodate 600 persons, and in the belfry is a bell of 10 cwt., cast by Mr. Murphy. Messrs. Barff and Co. supplied the altar and tabernacle. Expenditure about £2,000.

The Right Hon. Lord Carew has contributed £100 towards the erection of the new church at Courtnacuddy, also a site in addition.

A new Convent is to be built in a conspicuous position on the Upper Glanmire-road, Cork.

A large sum is to be appropriated to the extension and improvement of the Athlone Barracks, which are said to be very much restricted.

From the mineral statistics for 1858, compiled by the Keeper of the Records at the Museum of Practical Geology, it appears that the total value of minerals raised in the British Isles in that year was £22,319,599, of which two thirds were for coal. Estimating the value of the metallic ores when in a marketable state, and adding that of the coal, the gross amount is £31,266,932. It also appears that the quantity of coal raised in the year, which was 65,529,483 tons, was equal to nearly three times the quantity obtained in the five principal coal-producing countries of the Continent, and that of this large aggregate only 6½ millions of tons were exported, our home consumption and stock in hand accounting for all the rest.

Intelligence of the successful laying of the telegraph between the Channel Islands and France has been received.

Reviews.

Examples of Modern Alphabets, Ornamental and Plain. By F. Delamotte. London: E. & F. N. Spon.

In a former number we had occasion to notice the "Book of Ornamental Alphabets, Ancient and Modern," by the same author, and to express a favourable opinion thereof. The work now before us is a companion to it, and produced in similar style and size. The contents comprise examples of various Alphabets, large and small, Ornamental, Egyptian, Spurred Letter, Fleur-de-lis, Riband, Saxon, Italian and Roman shaded, Ornamented German, Italic, Gothic, Perspective, Rustic, Pearl, large and small Relief, Arabesque, Roman, and Old English, Analytical, &c.; together with Hebrew and Greek, and Engrossing and Court Hand Characters. The selections are excellent, and the book must prove an acquisition to numerous classes, from the architect to the sign-painter, and we may add, the scrivener likewise.

Irish Rural Almanac for 1860. William Robertson, Dublin.

The proprietors of an excellent cotemporary, the *Agricultural Review*, edited by Dr. Cameron, produced with the new year an almanac, to the compiling of which the editor and contributors of that journal lent their assistance; and the little volume—which, however, extends to some 180 pages of closely-printed letter press—is a most creditable work, elegantly printed, and comprising much valuable intelligence in farming, gardening, and sporting matters, besides some generally useful tables and memoranda.

Such spirited enterprise as characterises this establishment merits, and doubtless will command its reward.

The Architects' and Mechanics' Journal: an illustrated periodical.—New York.

Vol. I.; No. 9. (the first we have seen) has reached us. It gives us much pleasure to see that the various classes in the Far West, to whom our own journal—in this country—is devoted, are likewise represented by a very excellent contemporary. It, like ours, no doubt, has, in its infancy, much difficulties to contend with, arising from various causes, of which invidiousness is probably not the least prominent; but from our own experience of what *may* be done by energy and perseverance, we would counsel our "transatlantic brother" to bring these powerful levers unceasingly to bear—guided by forethought—and complete success will crown his efforts. The journal is *well written*, the selections *varied* and *judicious*, the paper, letter-press, and printing *good*, and the illustrations *excellent*. The remarkably small subscription of two dollars per annum (of course, in advance, and exclusive of postage) will secure 52 copies, and we warmly commend it to *our* friends.

There is another journal of a similar class published in Australia and termed the *Melbourne Builder*.

LAW NOTES.

COURT OF COMMON PLEAS.

The Right Hon. Lord Gough v. *Carmichael.*—Motion was made for liberty to plead double to this action, which was brought to recover damages for alleged negligence and breach of duty as an architect. The pleas sought to be pleaded were a traverse of the contract, as alleged in the summons and plaint, and also of the alleged negligence. Granted. Several cases of great interest to the members of the building profession especially will come off this term, amongst which we may name that of Kempston v. Butler, Hugh Kelly v. Crampton, Burke v. Carroll.

STATE OF THE COURT.

Sergeant Fitzgibbon applied to the Chief Justice to cause the proper authorities to have remedied the heating arrangements of the Court, and stated that he felt much difficulty in speaking at all, in consequence of the steam coming from under the table; and remarked "it was hardly credible that those who have the care of constructing and arranging buildings like those should be so brutally ignorant of the laws they are acting under." His Lordship promised to draw the attention of the Board of Public Works to the matter.

OBITUARY.

We regret to announce the unexpected death of Mr. Thomas Anthony, aged 62, of this city, architect and building surveyor, which took place on the 17th ult. Mr. Anthony was a native of Cork, an excellent draughtsman, and an experienced measurer, in which latter capacity he pursued a lucrative practice for many years, and for some time previously also undertook building contracts.

THE COUNTY SURVEYORS OF IRELAND.

SEVEN members of this body—viz., Messrs Brett (Wicklow), Lanyon (Antrim), Tarrant (Waterford), Townsend (Queen's County), Hill (King's County), Stokes (Kerry), and Tate (Dublin)—presented a memorial to His Excellency the Lord Lieutenant, to the effect—That the office was instituted in the year 1834, and was the first for which a competitive examination was required. That every holder has undergone examination, conducted in a severe and searching manner, into his qualifications as a civil engineer and architect. That the duties of the office are of an onerous and responsible character, and have been and are continually on the increase—fourteen acts of parliament having been passed, each of which has added to these duties, without providing any increase of salary. That there is no allowance whatever for travelling expenses. That the salary, after payment of travelling expenses, is little over £200 in the smaller counties, and much less in the larger. That such remuneration is inadequate to the qualifications, duties, and responsibilities of a county surveyor, and far below that received by civil engineers in other public departments, or by any of the other civil servants of the country of equal standing and attainments That while every other county office has been classified with salaries proportioned to the duties, no classification exists for the office in question. That the salary has, in every case, been fixed at the maximum allowed by law. That the duties of this office are exercised over areas, expenditures, and mileage of roads, which vary respectively from 200,000 acres to 1,200,000 acres—from £4,000 to £31,000—from 400 miles to 1,900 miles. That while the principle of superannuation is all but universally applied to other public officers, there is no provision by which county surveyors can be superannuated, or placed upon a retiring allowance. That the inadequacy of the remuneration has been frequently brought before the executive, and as frequently admitted." The memorialists pray that His Excellency will graciously cause such measures to be taken as will bring the matter before the legislature during the present session, so as to give effect to the recommendation of the select committee.

The prayer of the memorial is recommended by the Duke of Leinster; the Marquesses of Drogheda, Conyngham, Londonderry, Clanricarde, Sligo: the Earls of Antrim, Farnham, Arran, Dunraven, Bandon, Listowel, Ventry, Castlerosse: Viscounts De Vesci, Lifford, Ashbrook, Monteagle, Monck, Powerscourt: Sirs R. G. Booth, M P., George Hodson, D. Norreys, J. Esmonde, C. Coote, A. Weldon, H. Walsh, Thomas Young, G. G. Aylmer, James Stewart, Thos. Burke, M.P., C. O'Loghlen, John Carden John Stronge, Richard Musgrave, Richard O'Donnell: Barons Dunboyne, Stuart Decies: and the following Members of Parliament—Lord Dunkellin, D. O'Connell, The O'Donoghoe, Right Hon. H. A. Herbert, W. Monsell, Dawson Damer, Michael Dunne, R. P. Dawson, Stewart Knox, W. W. F. Hume, Charles Tottenham, E. J. Cooper.

Miscellaneous.

SIR JOHN MCNEILL, C.E., AND MR. JOHN BOWER, C.E.—A smart correspondence has recently appeared between these gentlemen, relative to the proposed Letterkenny and Lough Swilly Railways, of the former of which projects Mr. Bower is engineer. Sir J. McNeill asserts that "the Letterkenny line has a series of curves of contrary flexure from end to end; that "there are only 1¾ miles which can be considered straight;" condemns the curves in Donegal; and assumes that "the Board of Trade will not sanction the level crossings;" states "that a good line could be laid out that would suit the country better;" that "the cuttings and embankments are not judiciously planned," &c., &c. To these Mr. Bower replies, that (even if true) "curves of contrary flexure would not indicate a bad line, as nearly all modern railways have become of that character, economising capital, and increasing the profits to the shareholders;" that "the straight portions measure upwards of 3 miles;" that "there are 4¾ miles on flat curves of from 4 to 12 furlongs radius," making nearly 8 miles which, for all practical purposes, "may be considered straight." Mr. Bower also reminds Sir John, that he (Sir John) is now making lines with *quicker* curves on *worse* gradients—viz., County Down main line, and Bangor and Donaghadee branches; also, that on the Navan and Kells line there are *seven* level crossings out of *eight* public roads, on *nine* miles of railway; and hopes before the Parliamentary Committee to disprove the statement relative to the cuttings, &c.

OAK STAINS.—To such perfection has "imitation" in painting arrived, that the *natural* product may frequently find a fitting substitute in the artificial article; and perhaps in no instance connected with building materials is it more so than in that of woods and marbles. An imitation, if inferior, is positively *bad* to a vengeance, but if good, it will command attraction. The process of staining and varnishing is comparatively simple, and certainly more effective than the ordinary *regimé* of painting. To impart even to *new* deal the appearance of "oak" is the purpose of Ibbotson's stain, for which Messrs. Boileau and Boyd, of this city, are the agents.

TESTIMONIAL TO DR. CAMERON, Professor of Chemistry, Editor of the *Agricultural Review*. &c., &c.—We are much gratified to see that this long-contemplated and well-merited compliment has at length been matured, and that the handsome sum of £130 has been subscribed. The testimonial is divided into two portions—the one ornamental and useful, consisting of a very large gilt shade clock, representing Pandora in the act of opening the box and letting forth its destructive contents; the base, wreathed, standing on a gilt plinth. The supports are a pair of candelabra for five lights each, representing "History" and "Fame," each standing on a gilt plinth. The inscription is engraved on a silver-gilt shield, let into the rosewood stand for the shade. The whole constitutes an exquisite group; and in the selection of the figures of History and Fame the committee have manifestly intended to convey to Professor Cameron, in allegory, a graceful and marked compliment. The other is to be a complete chemical apparatus; and in coming to that decision the committee have exercised great judgment and good taste.

DROGHEDA HARBOUR BOARD—STAMEEN QUARRY.—At a recent meeting of this Board, Mr. Donor, Harbour Engineer, reported—"Now that the working of this quarry is about to terminate, and finding at all times the anxiety felt by this Board for the safety and welfare of the men in their employ, it becomes my pleasing duty to be able to inform them, that for nearly nine years past, during which time the work has been conducted by steam and manual labour, raising annually from 24,500 to 27,000 tons of stone, and having, by blasting, during that period, consumed five and a-half tons of powder, from the commencement of the work to the present time not one man has been disabled, or otherwise injured, so as to prevent him from attending to his work before the end of a week; and those solitary cases were caused by a cut from a stone or a bruise from a crowbar. This happy result is chiefly owing to the precautions taken to have the staging, gantry-roads, and machinery properly attended to."

ACTION OF IRON NAILS IN SHIPS.—M. Kuhlmann asserts that the use of iron nails in building wooden ships is one of the chief causes of their decay. The rotting or decay of wood is a process of slow combustion, and M. Kuhlmann considers that the iron nails act as carriers for oxygen, and introduce it into the substance of the timber. By contact with water and air the iron is rapidly converted into a sesquioxide. In this state it yields a portion of its oxygen to the wood, and is reduced to the state of protoxide, which further action of air and moisture converts to the sesquioxide and so the process goes on. M. Kuhlmann fortifies his theory with several experiments, and appeals to the well-known blackened and rotten appearance of ships' planks that have been long in contact with iron nails or bolts. Copper nails do not produce this effect. This is a matter which ought to be investigated by our naval authorities, as a large proportion of our annual expenditure arises from the decay of ships. We believe housewives will admit one fact which M Kuhlmann adduces, namely, the tendency to decay of those portions of linen or cotton articles which are affected by iron mould.

A handsome pyro-pneumatic stove-grate, combining the double quality of warming and ventilation, has been fixed in the National Bank. It answers its purpose admirably, and is the invention of Mr. William Pierce, 5, Jermyn-street, London, from whom full particulars as to its principle may be had.

THE PANTOMIMES.

THE "merry Christmas" and "happy new year" greetings are now matters of memory only, scarcely a relic of the festive season being left save the Pantomimes! The thread too of *their* existence is doomed to be untimely cut, when the withdrawal of the novelty element—now an expiring spark—in their vitality compels them to "yield up the ghost." The mysterious Harlequin's wand, the ærial movements of the Columbine, and the adventures of the "funny" Clown and suffering Pantaloon were never better appreciated by the public, both *old* and *young*, than in the Pantomimes presented this season at our Theatres. At the *Royal*, King Hotuponeverything vociferously maintained his supremacy as "King of the Castle," amongst all the gorgeous appendages of his court; and Prince Diamond and the Princess Brighteyes "*loved* and were *beloved*," until the cruel fairy, rejoicing in her powers of transformation, used her magic influence. The scenery, as usual, was diversified and attractive, though probably questionable—omitting the artist's licence—in some details. However, the lessee's catering energies seem not to flag, and he has maintained, as is his wont, the *ancient* credit of our national Theatre.

The *Queen's* audience, judging from happy faces and applauding hands, seemed to relish the humour and the adventures of "*Daniel O'Rourke*," with his not very enviable winged companion. The scenery, appointments, and mechanical appliances were, as usual, creditable to Mr. Webb's enterprise, making due allowance for comparatively limited resources.

NOTICE.

Post-office Orders and Remittances should be made payable to MR. PETER ROE, 42, MABBOT-STREET, DUBLIN.

☞ *NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the* DUBLIN BUILDER." *All other Communications should be addressed to the "Editor."*

Building Materials.

SAWING, PLANING, & MOULDING MILLS,

GREAT BRUNSWICK-STREET, DUBLIN,

MICHAEL MEADE,

HAVING nearly completed the extensive Buildings and Machinery for Sawing, Planing, Moulding, Tenoning, Grooving, &c., Timbers at his new works, begs to inform his friends and the public that he has REMOVED his business from Westland-row. In conjunction with his business as Builder, he has now opened a new department for the sale of all descriptions of Materials used in Building. Timber, Deals, Laths, Prepared Flooring, Skirtings and Mouldings of all Sizes and Patterns always on hand Doors, Sashes, Sash Frames, Shutters, Architraves, &c., made to order on the shortest notice and most reasonable terms. Being the *only* Manufactory of the kind in Dublin, it offers an advantage to persons Building which has not hitherto presented itself in this country.

From M. M.'s long practical experience in the working of all descriptions of Timber, persons requiring their Timber sawn or planed will find a great advantage in sending it to the above Mills.

THOMAS HENRY CARROLL,

70, SIR JOHN ROGERSON'S-QUAY,

(formerly occupied by Mr. James Fagan).

Now landing, ex CLIO, from Quebec,

The following FIRST-CLASS TIMBER GOODS:—

Prime Red Pine, of largest average and superior description.

„ *Quebec Oak, Elm and Ash.*
„ *White Pine* clean and large.
„ *Pine Board Timber*, of largest averages.
„ *Pine Deals & Plank*, 1st & 2d quality (no 3rds).
„ *Spruce Deals & Battens*, do., do., do.
„ *Pine Staves and Hogshead Staves*

N.B.—This Cargo is one of the best ever brought into this market, and the Timber will be sold according to the established rule of the port—viz., STRING MEASURE.

70, SIR JOHN ROGERSON'S-QUAY.

Is also fully supplied with the best ENGLISH, IRISH, and SCOTCH CLAY GOODS, including

Roof Tile, all sizes, Fire Bricks and Blocks,
Paving Tile, do. Chimney Tops and Cans.
Ridge Tile, do. Common and Fancy Bricks.
Sewer Pipe, do. Red Fronting Bricks.

Bangor Slates, and Bangor and Valencia Slate Slabs, Slate Cisterns; Portland, Scotch, Caen, and Daubigny Stone; Irish Limestone, in Block; Yorkshire and other Flagging; Seasoned Mahogany and Walnut Plank.

TWO CARGOES OF FIRE-CLAY *(Coal Island)* DRAINAGE PIPES, are now discharging.

THE CITY SAW MILLS.

JOSEPH KELLY,

Having purchased the Interest in Nos. 66, 67, and 68 THOMAS STREET, which adjoin the Saw Mill Premises, 128, FRANCIS-STREET, begs to inform the Public the Principal Entrance will be 66 and 67 THOMAS-STREET (opposite John's-lane). The large space acquired will give increased facility, and prevent any complaint as to delay.

Having also erected EXTRA MACHINERY for SAWING, PLANING, and MOULDING, &c., estimates can be furnished for Architraves, Doors, Sashes, Skirtings, &c.

The SLATE, PIPE, TILE, and BRICK YARD, JOHN'S LANE, is largely stocked with Wyatt's Best Bangor Slates, Doulton's Sewerage Pipes, Bridgewater Fronting Bricks, Oven Tiles, &c., Chimney Tops and Flue Linings.

The WHOLESALE YARD, Sir John's-Quay, contains:—

A large Stock of well-selected Timber and Deals, of the following Cargoes, imported this year, viz:—

Ex Agnes, St. John's Deals.
Ex York, do. do
Ex Cascade, St. Stephen's Deals.
Ex Swarthwick, Quebec, Timber Deals and Staves;
Ex Triton, from Memel, Timber and Lathwood.
Ex Sophie, Richabuctoo, Deals.
Ex Hiawatha, St. John's Deals.
Ex E. Sherman do. do.

And daily expects,

Ex Oello, from Memel, Timber, Deals, and Lathwood.
Ex Argentinus, St. John's Deals.

Which will be sold at moderate rates.

THE CITY SAW MILLS,
66 and 67 THOMAS-STREET
(Opposite John's-lane), late
127 FRANCIS STREET.

BUILDERS' Framing, Flooring, and Bench Cramps, in great variety of size and price, at

BOOTH, BROTHERS',
3, UPPER STEPHEN-STREET, DUBLIN.

SUPERIOR Red Fronting BRICKS, also Prime Stock Bricks, delivered at any Station on the Dublin and Wicklow Railway, at Kingstown, Dublin, &c., can be had from

BENTLEY AND SON,
110, GRAFTON-STREET, DUBLIN.

Samples lie at our office.

BUILDERS' GOODS, Kitchen Ranges, Ironmongery, Window Glass, Oils, Paints, and Paper Hangings, of the best qualities, at MAURICE BROOKS', SACKVILLE-PLACE, DUBLIN.

PATENT RIDGE TRESSLE,

FOR Builders, Bricklayers, Painters, &c. These Tressles will be found very important, as they make a safe and useful Scaffold on the Ridge of a Building in a few minutes.

For particulars apply to WILLIAM WILKINS, Builder, BANBURY, OXFORDSHIRE.

OFFICE OF THE "CROWHILL, MILTON, AND KENMUIR QUARRY COMPANY (Limited)."

51, Renfield-street, Glasgow.

HAVING entered upon a Lease of those extensive and well-known Quarries—Crowhill, Milton, and Kenmuir, near Bishopbriggs—long wrought by Mr. Wm. Neilson, parties desirous of supplying themselves with a first-class Rock, will be served promptly with any quantity, however large.

From our facilities for despatching materials by private Railway to Forth and Clyde Canal, Builders in Ireland will find this a cheap and ready mode of supplying themselves.

Any orders with which we may be favoured, shall receive our best attention.

WILLIAM GRAY, Secretary.

Note—We refer for sample of our stone to the new National Practising Schools, at Lower Gardiner-street, Dublin, and new Exchange, Dundalk.

BATH STONE OF BEST QUALITY.

RANDELL AND SAUNDERS,

QUARRYMEN and STONE-MERCHANTS,
BATH.

List of prices at the Quarries and Depots, also cost of transit to any part of the United Kingdom, furnished on application to Bath Stone Office, Corsham, Wilts.

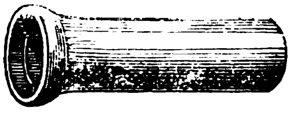
BATH STONE OF BEST QUALITY.

PICTOR and SON, Quarry Proprietors and Stone Merchants, BATH. List of Prices of Box Ground, and Corsham Down Stone (loaded in railway trucks at Box or Corsham Station), also cost of transit to all parts of the kingdom forwarded on application to Bath Freestone Works, Box, near Chippenham, Wilts. Dressings both plain and ornamental) prepared ready for fixing.) Vases, Tombs, Chimney-pieces, &c.

TIMBER AND SLATE STORES,

SWIFT'S-ROW, Lower Ormond-quay
(Near the Metal Bridge).

Mahogany, Cedar, Rosewood, Walnut, Birch. American Ash, Pine, Deals, Staves, &c., &c. A large Stock of Staves on hands. Country Orders promptly attended to. GEORGE FINNEGAN.



FIELD DRAINING PIPE TILES.

JOSEPH KELLY is landing at his Stores, Sir John's-quay, a large Cargo of Dungannon Fire Clay Field Draining Pipes, consisting of 1½, 2, 3, and 4 Inch, which will be sold at moderate rates.

CITY SAW MILLS 66 and 67, THOMAS-STREET.
Dublin, 18th October, 1859.

TO ARCHITECTS AND BUILDERS.

HENRY E. JAQUES Architectural Carver (late of Myres's, of London), begs to inform the above that he has commenced business at 36, Middle Gardiner-street; and having a thorough knowledge of Architectural Carving, he respectfully solicits their patronage.

N.B.—Plaster Models Cut.
36, MIDDLE GARDINER-STREET.

Building Ground, &c.

BUILDING GROUND at RATHGAR—between Kenilworth-square and Harold's-cross-road, near Roundtown—to be Let, at from 2s to 3s. per Foot, Landed Estates Court Title, and 900 years' Lease. Apply to

BENTLEY AND SON,
110, GRAFTON-STREET, DUBLIN.

N.B.—A Quarry on the land, and bricks at half-price.

A FEW HALF-ACRE PLOTS at DUNDRUM for Detached Houses, within three minutes' walk of the Railway Station, to be Let cheap. Bricks and Stone on very moderate terms to parties building.

BENTLEY AND SON,
110, GRAFTON-STREET, DUBLIN.

BUILDING GROUND, most desirably situated on the SORENTO-ROAD, DALKEY, to be Let, on a Lease for 900 years; also the ground at CLIFF-TERRACE, near SANDYCOVE, BULLOCK. The particulars of which may be known at the Office of John Louch, Esq., 15, MOLESWORTH-ST., DUBLIN.

TO CAPITALISTS AND BUILDERS.

TO BE LET for BUILDING, the Ground round Wellington-square and in Hatch-street, the Maps and particulars of which may be seen at the Offices of John Louch, Esq., Architect, 15, Molesworth street, Dublin.

BELMYRA, DUNDRUM, CO. DUBLIN.

TO CAPITALISTS, BUILDERS, & OTHERS.

MOST Desirable Building Ground TO BE LET.—This Estate, containing 150 Acres, situated within half a mile of the Dundrum Railway Station, has been laid out in Lots for Building. The position is admitted to be the most beautiful in the environs of Dublin, and is particularly well circumstanced in every respect, commanding views of Killiney Hill, overlooking Mount Merrion, City and Bay of Dublin, &c.

A railway station in the centre of the estate is in contemplation, bringing it within ten minutes' drive per rail of Harcourt street.

A map of the lands, showing them laid out in building lots, can be seen, and every information obtained, at the offices of Edward Henry Carson, C.E., Architect, &c., 25, Harcourt-street.

IN CHANCERY.

Ffolliote
v.
Ffolliote.

TO be Let, on very reasonable terms, all that and those the Houses and Offices known as AIR LODGE, RATHMINES, containing every accommodation for a respectable family. Also the House No. 6, MARINO-CRESCENT, CLONTARF STRAND, having Parlours, Drawing rooms, four best Bedrooms, Servants' Room, Water Closet, Kitchen, Pantry, &c.; Garden front and rere. These Houses are beautifully situated, commanding good views, with the advantage of the omnibus passing every half hour to and from Dublin. For terms apply to the Receiver, Edward Henry Carson, Esq., 25, Harcourt-street; or his Solicitor, Peter Lambert, Esq., 35, Lower Ormond-quay.

THE Representatives of the late Mr. JOSEPH BOOTH, 35, GOLDEN LANE, Dublin, respectfully present their sincere thanks to the Nobility, Gentry, and Traders of Ireland, for the patronage their Establishment has been favoured with for the past half century, and are now desirous of calling particular attention to their extensive Stock in Trade.

The Mahogany Stores are well supplied with St. Domingo, Cuba, Honduras, and Mexican wood, in log and plank.

The Veneer and Fancy Goods consist of St. Domingo mottles and curls, Rosewood, Tulipwood, Ebony, Bird-eye Maple, Havana and Pencil Cedar.

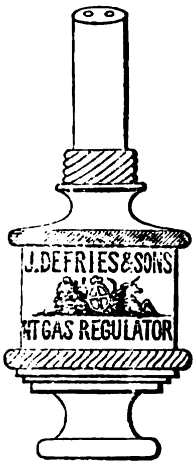
The Timber Stores are well supplied with Memel, Oak, Red and White Pine, in log and plank; also, Quebec and St. John Deals, from eight to twenty feet long.

The character of the Artist Warehouse is so well known that it is only necessary to inform the public that special attention will be paid to this department, and every article will be stamped with the maker's name.

To prevent any mistake, please direct to

BOOTH'S
35, GOLDEN-LANE, DUBLIN.

N.B.—All orders by post will meet immediate attention.



NEW GAS REGULATOR AND PURIFIER.

MESSRS. DEFRIES & SONS, of London, having taken out a Patent for the above new Gas Burner, we beg to announce that we have just made arrangements with them for the special sale of it.

This artistic and complete Burner is the most economical ever introduced, and is the admiration of all scientific men, on account of the various qualities it possesses.

First—It purifies the Gas by filtration, and allows no more Gas to pass through the Burner than is absolutely required to give a full, clear, and brilliant light.

Second—It effectually checks all undue pressure, and does away with the unpleasant flickering and noise caused by the same.

Third—The interior is anti-corrosive, and is impossible to get out of order, and when once set right it will last for years.

Fourth—This Burner answers with any common nib, and is unerring in its operation.

Fifth—It can be fitted by the most inexperienced hand.

Sixth—Though last, not least—it effects a saving of 25 per cent.

Price 1s. 3d. each.

GREGG AND SON (Sole Agents),
LAMP MAKERS AND GAS FITTERS,
18, UPPER SACKVILLE-STREET, DUBLIN.

HURLFORD FIRE-CLAY DEPOT,

47, COOK-STREET, GLASGOW.

JOHN ROBSON begs to draw the attention of Gentlemen and Farmers to his superior

CATTLE TROUGHS FOR FEEDING CATTLE,

which were awarded the FIRST PRIZE at the Glasgow Highland Agricultural Show, in August, 1857; at Aberdeen, September, 1858; at Glasgow Local Show, June, 1858; and at other Agricultural Shows; and Medal, 1859, at Edinburgh Highland Agricultural Show.

HORSE MANGERS WITH GRUEL-BOX, SINGLE MANGERS, PIG TROUGHS, SHEEP TROUGHS,

Always on hand, GAS RETORTS, FLUE COVERS, FIRE BRICKS, FLOORING TILES, Plain and Ornamental CHIMNEY CANS, GROUND FIRE-CLAY of best quality; Oncomes for Vents, Ventlings, round and oval; Patent Square Ventlings for to prevent back smoke, and give good ventilation into rooms; Stack Pillars, which were awarded the Silver Medal at Glasgow, June, 1859; at Edinburgh Highland Agricultural Show, August, 1859; SEWERAGE PIPES, from 2-inch up to 24-inch bore, which were awarded the First Prize of £5 at Edinburgh Highland Agricultural Show, August, 1859; FIELD DRAIN PIPES, which were awarded the First Prize at the Highland Agricultural Shows—Aberdeen, September, 1858, and Edinburgh, August, 1859.

All Orders sent to the above Address will be promptly executed.

THE PATENT CRYSTAL WINDOW BARS, adapted for Domestic Windows, Shop Fronts, Conservatories, Skylights, Verandahs, Exhibition and Counter Cases, Aquariums, Fern Cases, etc., etc., combining perfect transmission of light, durability against rust or decay, and economy in the facility with which they are kept clean.

Aquariums with Slate or Marble Bottoms of various sizes, with or without Fountains, also of glass.

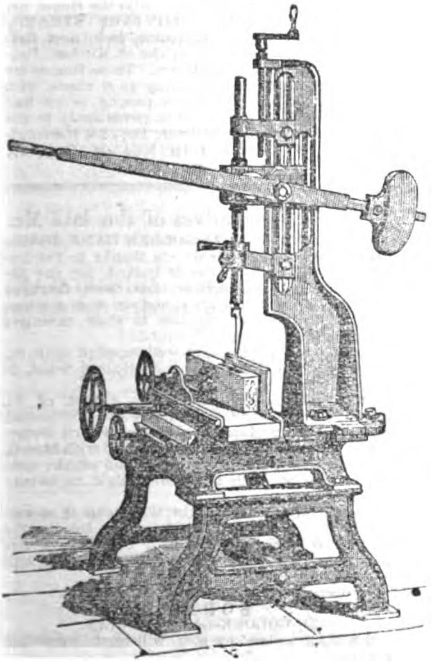
Manufactured by LLOYD & SUMMERFIELD, Park Glass-Works, Birmingham.

All kinds of Flint Glass, cut and plain, Coloured Window Sheet, Optical Sheet, Coloured Lenses, etc.

Agents at Dublin—Messrs. SIBTHORPE and SON, CORK-HILL.

GALLON AND BEAN, LEEDS,

Cut & Wrought Nail Manufacturers, & Hardware Merchants,



RESPECTFULLY request all BUILDERS, CONTRACTORS, CARPENTERS, &c., requiring Mortising Machines, previous to purchasing, to examine and test *their patent combined Crank and Lever Machine*, which will Mortise (Tenon and Bore, if required) both Hard and Soft Wood, and is also adapted for Drilling and Punching Iron.

The superiority of this Machine over *all* others consists *in the substitution of a solid wrought-iron plate Crank or Eccentric, by which greater power is obtained, in place of cast-metal Rack and Pinion Wheel, the Teeth or Cogs in which are so liable to strip or break out*—in the direct and perpendicular action of the Lever and Crank on the Cutting Tool, and consequent diminution of friction—in being *stronger* and *less complicated* in its construction, and more *powerful* in its motion—in the *facility* of its *adaptation* to the various depths of material—and in its *non-liability to break* or get out of working order.

This Machine has now been adopted in preference to *all others* by some of the principal Builders in London, Glasgow, Edinburgh, Dublin, and Belfast, who will bear testimony to its being the most powerful and efficient yet made

For further particulars apply to the Patentees and Makers, GALLON, BEAN, and LUMB, LEEDS.

Extract from the Report of the Royal Dublin Society's Spring Show, 1859:—

"Gallon, Bean, and Lumb, Leeds, exhibited a very useful and complete Mortising Machine, which was highly commended."

N.B.—The Patentees respectfully intimate that this Patent extends to, and comprises Machines for Mortising by Steam and other motive power, as well as by hand; and makers and vendors of, or parties buying or using Mortising Machines, *are cautioned against any infringement*, as the patent right will be strictly maintained.

TO ARCHITECTS, BUILDERS, AND OTHERS.

PATRICK KERR, SURVEYOR & BUILDER, considers it advisable at this particular period to inform his numerous friends that it is not his intention to confine himself *exclusively* to the Building business; and begs to say he will still continue to act as Building Surveyor and Measurer.

93, Leinster-road, Rathmines,
January, 1860.

TO THE LANDED GENTRY OF IRELAND.

ADVERTISER begs to acquaint the Noblemen and Gentlemen of Ireland that he has had great experience as an Agricultural Engineer and Architect, and is open to engagements for the preparing of Plans for Farm Buildings, Drainage, &c., for the ensuing Spring.

Gentlemen wishing to obtain Loans under the Lands' Improvement Acts should at once consult Mr. SLOANE, who will send them the Forms, prepare the requisite Plans, &c., in compliance with the Rules of the Board of Public Works in Ireland, on whose staff Mr. S. was for many years.

JOHN S. SLOANE, ARCHITECT & SURVEYOR,
5, RICHMOND-STREET, Mountjoy-square, Dublin.

MESSRS. JAMES & EDWD. BARKER,
CONTRACTORS
To Her Majesty's War Department, and the Ecclesiastical Commissioners for Ireland.
All orders executed to satisfaction.
32, UPPER ABBEY-STREET, DUBLIN

MESSRS. O'DUFFY AND EGAR, SURGICAL and MECHANICAL DENTISTS, may be consulted *free* at 75, DAME-STREET, opposite the Lower Castle Yard.

ESTABLISHED THIRTY-FIVE YEARS.

F. SURRIDGE (late of London), Manufacturer of Photograph Apparatus, Scientific Modeller, &c.
67, AUNGIER-STREET, DUBLIN.

PURE AND BRILLIANT GAS LIGHT.

GAS IN COUNTRY MANSIONS.

IMPROVED PATENT HYDRO-CARBON GAS APPARATUS.

JOSHUA EDMUNDSON and Co. having the exclusive right to Manufacture and Sell this Gas Apparatus, call attention of the Public to this most valuable invention. It is peculiarly adapted for Lighting Gentlemen's Mansions, Colleges, Mills, Manufactories, Railway Stations, other Country Establishments, and Public Gas Works for Towns.

The Apparatus will produce more Gas from a ton of Coal than any other, and can be so arranged in the erection that the Cooking of an establishment, of whatever size, can be effected without expense, no fuel being required beyond that used in making the Gas.

Particulars as to price, size, scientific merit, etc., and the most satisfactory reference to parties for whom it has been erected in this country, will be given by

JOSHUA EDMUNDSON AND CO.,
34, 35, 36, CAPEL-STREET.

Estimates for all parts of the Kingdom given, free of expense.

Country Towns lighted at a very small cost.

Agents for Milner's Fireproof Safes.

IBBOTSON'S IMPROVED OAK STAIN, for imparting to New Deal the appearance of Oak, and to New Oak the appearance of Antiquity.

It is about half the expense of paint, and is easily applied with a brush. Being an Oil Stain, it has the important advantage over all other stains of being impervious to wet. It produces a bright gloss, but if a high polish is required, the proper varnish can be applied. It requires no size or previous preparation of the wood.

The Stain (with the proper varnish, if required), of three shades—Light, Middle, and Dark—is sold in Bottles at 6d., 1s., and 2s. each, or by the Gallon, at 10s.

SOLE AGENTS—BOILEAU AND BOYD,
(Late John George Boileau and Co., Mary's-abbey)
92, BRIDE-STREET, DUBLIN.

DRAUGHTS of COLD AIR round DOORS and WINDOWS prevented by GREENWOOD'S PATENT INDIA RUBBER STOPS, and Self-acting Slides, for the bottoms of Doors, which have proved to supersede all previous invention for the purpose of Making the Joints of Doors, Windows, Show Cases, &c., AIR TIGHT.

Agents for the Patentee—
FERGUSON AND CO.,
Patentees & Manufacturers of Vulcanized India Rubber, Gutta Percha Waterproof & Airproof Fabrics,
103, GRAFTON-ST., DUBLIN.

BUILDERS' IRONMONGERY, AT REDUCED PRICES.

THOMAS HENSHAW & CO.,

5, CHRIST CHURCH PLACE,

BEG to call attention to their extensive, varied, and well-selected Stock of Ironmongery in all its different branches. It consists of Parlour, Drawing-room, and Bed-room Grates; Kitchen Ranges, Cottage Ranges, Sash Weights; Iron Rim, Mortise, and Stock Locks; Hinges of all descriptions; Wrought and Cut Nails, Eave Gutters. Down Pipes and Fittings, Metal Skylights, Ventilating Bricks; Cast-iron Chimney-pieces, with and without Grates; Rabbit Traps, Fox Traps, Galvanized Wire Netting, Fencing Wire, Sheet and Perforated Zinc, Sink Traps, Furnace Doors and Frames, Hot Air and Plain Stoves. Also on Sale, Saunders' Patent Cooking Range, *the* most economical Cooking Apparatus of the day.

Manufacturing and General Ironmongers and Tool Warehouse—81, MIDDLE ABBEY-STREET.
Spade, Shovel, and Tool Works—CLONSKEAGH.

Agents for Perry's Patent Fire-proof Safes; quality considered, they are *the* cheapest in the market. Builders are invited to inspect our Stock previous to purchasing.

5, CHRIST CHURCH PLACE, DUBLIN.

W. WARNE AND CO.

CALL the attention of Engineers and others to their PATENT MINERALIZED and VULCANIZED INDIA-RUBBER, in Sheets, and for Valves, Washers, Railway Buffers, Bearing Springs; Hose Pipes (delivery and suction), Flexible Tubings, Driving Belts, and to their improved Anglo-American FLEXIBLE CANVAS and INDIA-RUBBER PACKING, for Steam Joints and Piston Rods.

SOLE MANUFACTURERS OF THE

NEW PATENT MINERALIZED KAMPTULICON,

AND OF THE

MINERALIZED INDIA-RUBBER SOUNDLESS CARPET CLOTH,

Combining EXTREME FLEXIBILITY, and consequent non-liability to cracking; DURABILITY and IMPERMEABILITY to Wet; WARMTH TO THE FEET AND SOFTNESS TO THE TREAD.

SOLE MANUFACTURERS OF

WARNE'S NEW PATENT INDIA-RUBBER MATS.

These Mats consist of Tubes of India-Rubber, of various configurations, placed vertically in contact with each other, and are far more efficient than any other description of Mat. No ordinary wear can sensibly affect them; they thoroughly clean the feet like a brush, and the dirt removed falling through the cells formed by the tubes, is not carried by the feet on to the floors and passages, which are consequently kept perfectly clean; and by removing the Mat, the accumulated dirt is easily swept away. They are also made with backs.

The Mats never clog, require no beating, and are readily cleansed by water. Unlike all other Mats, water in no way injures them, and it neither lodges on nor is absorbed by them. Indestructible by damp or wet, these Mats, made to any shape, size, or thickness, are especially suitable for uncovered passages and out-of-door purposes.

The invention is peculiarly applicable for Mats for Baths, Conservatories, Laundries, Sculleries, Ships, Steamers, Omnibusses, Carriages, and Seats, also for Churches, &c.; and for Scrubbing Brushes for Decks, and Wooden and Stone Floors, and for Housemaids' Mats.

All Mats are marked W. WARNE and CO., Patentees, London. Orders received at the London Warehouse, 9, GRESHAM-STREET WEST, E.C.; or at the Factory, TOTTENHAM, N, MIDDLESEX.

WILLIAM BISSELL,

UNION STREET, WOLVERHAMPTON,

SOLE Proprietor of the Improved MORTISING MACHINE, the newest, most easy, simple, and powerful, yet invented. Also the universally and justly-celebrated Equi-action RIM and MORTISE LOCKS.
Patentee of the well-known Flooring Dogs, and 4-Ton Lifting Sacks.
Factor and General Manufacturer of Builders' Ironmongery.

Machinery, Patents, &c.

HAMMERSMITH IRON WORKS, DUBLIN.

MESSRS. TURNER AND GIBSON, Manufacturers of IRON CONSERVATORIES, Fruit Houses, Pine Pits, etc.

ORNAMENTAL WORKS, Bowers, Porches, Balustrades, Trellises, Flower Stands, Vases, etc.

GRAND ENTRANCE GATES, Guard Railings, Farm Gates, Hurdles, and Strained Wire Fencing, etc.

IRON ROOFS for Railway Stations, Breweries, Gas Works, and Farm Buildings, etc.

WARMING & VENTILATING Dwelling Houses, Prisons, Conservatories, Mills, and Public Buildings, etc.; House, Laundry, Cooking, and Steaming Apparatus.

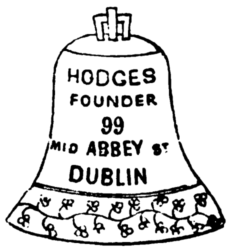
BRIDGES, GIRDERS, Iron Lattice, Bowstring, Suspension, Patent Balance Rolling, and Swivel Bridges, and Floor Girders

T. and G. beg to refer, as specimens of *their work*, to the Iron Conservatories, Heating, etc., as erected at the ROYAL BOTANIC GARDENS, KEW; the INNER CIRCLE BOTANIC, REGENT'S PARK; CHELTENHAM; VICEREGAL LODGE; GLASNEVIN; and various Works by them throughout the United Kingdom.

PATENT OFFICES and DESIGNS REGISTRY, *North West Chambers*, 4, *Lower Ormond-quay, Dublin; and* 47, *Lincoln's Inn Fields, London*. J. P. BYRNE, *Solicitor, Agent*.

N.B.—A useful Pamphlet, "Hints to Inventors and Designers," gratis on application.

London and Paris Great Exhibitions



Prize Medal Bells.

PATENT ASPHALTE ROOFING FELT.

ELLIS AND CO.,

MALONE MILLS, BELFAST,

Manufacturers of

PATENT ASPHALTE ROOFING, SHEETING, INODOROUS, AND BOILER FELTS.

Sole Agents in Dublin,

Messrs. CAROLIN AND EGAN, 20, EDEN QUAY.

ASPHALTIC ROOFING FELT, a light, clean, economical, and durable roofing, price 1d. per square foot. Samples and instructions may be had gratis in answer to letters from any part addressed to MAURICE BROOKS, IRONMONGERY, GLASS, & ROOM PAPER WAREHOUSE, SACKVILLE-PLACE.

WM. M'CLEARY WIGHTMAN, PRINTSELLER & ARTISTS' COLORMAN,

22, *NASSAU-STREET*,

Has always on hand a large and varied Stock of Drawing Materials, Paper of different sizes, Colors Brushes, Pencils, &c., which professional gentlemen and others will find adapted to their requirements, & moderate in price.

ARTISTS' WAREHOUSE AND PHOTOGRAPHIC GALLERY,

22, NASSAU-STREET.

ROGERS'S PATENT PEAT CHARCOAL, for Sanitary Uses generally: for Disinfection of the Dead, Purification of Sick Chambers, Filtration of Water, Purification of Ships, Stables, Cattle Sheds; for Packing Provisions, Eggs, Butter, &c.; and for Agricultural Purposes. Manufactured by THE HEALTH OF TOWNS IMPROVEMENT COMPANY.

Works and Depots:—Derrymullen, Robertstown, Co. Kildare; Newcomen-bridge, Dublin; 5, Donegal-square, North, Belfast. General Agent—JOSEPH G. THOMPSON.

The Dublin Builder.

VOL. II.—No. 15.

ON THE MORE EXTENSIVE ADAPTATION OF GLASS—COLOURED ESPECIALLY—TO ORNAMENTAL AND USEFUL PURPOSES.

THE sudden and mysterious changes produced by the fabulous ring of "Arabian Nights' Entertainments" celebrity, could be scarcely more striking than the rapid transformations of the march of intellect. Our crystal palaces, arising, as it were, at the bidding of commercial greatness and necessity, complete in arrangement and detail, containing all that is classic and artistic, novel and useful, seem like the realization of romance, and are calculated, when we look back on the barrenness of ages gone by, to impress us with an idea that it is owing to something more than human agency or invention. The genius of improvement strides along, and borne by its advancing columns, we cannot often disengage ourselves to gaze upon the moving panorama with a contemplative eye. Easy is it for the poet or the essayist to stand, pen in hand, and dot down each striking feature, gathering therefrom instruction, and, yes, a veritable moral; but the practical man, if he be not dexterous, cannot do this but seldom, without risk of losing his place, and of being over-ridden and lying

"For pavement to the abject rear."

But he must even sometimes give himself breathing-time to contemplate. He cannot halt, as one of the automata in a puppet-show, but, still moving, must direct the world whither to look, and upon what to think, as he presses onward. Our architectural and engineering creations may seem to encourage the idea of a material production eclipsing mental power—of reality eclipsing ideality; but it is false. The actual result represents but an insignificant quota of the ideal whole. A fruitful genius is too often crippled by conventionalisms, and thus checked in mid-career, becomes a poor interpreter of its own resources. Therefore may we look on works of art, in most instances, as but shadows before of these to come, and what may seem to us now as but fairy creations, or rather, as they are generally called, romantic notions, will be ultimately realized, and the veil that hides a glorious future be gradually drawn aside. This is as sure as the simplest revelations of science have dissipated the mysticism attached to the history of an ancient Egyptian priesthood, whose necromancy held so many millions in the chains of superstitious awe, but the secrets of which we can identify with a knowledge of chemistry and natural philosophy.

Among the many materials that are contributing to work such changes in the hands of enterprise, that of glass has been, and still is, an important one. To say that it has been used ever as a poetical simile for clearness, transparency, and brilliancy, would be needless, as no simile has been so hackneyed by our poets, if we may give it so rude a term. Ever a favorite with fabulous writers, it has now become so of theatrical scenists, and no material is capable of so many adaptations in a decorative sense. Already have our London, Dublin, and Paris exhibitions demonstrated the immense range to which its many uses have access, and of which it is susceptible in an architectural sense; in an engineering one it has yet to be proved of immense value. At some future time we may enter into this, but at present our remarks are intended to apply rather to *coloured* glass, and its prospective uses in a decorative sense.

Beckman says, "It is probable there was no great interval between the discovery of the art of making glass and that of giving it different colours." He proceeds to notice the first motives for that colouring, which appears to have been one of imitation—viz., the manufacture of artificial hyacinths, sapphires, &c. There seems no doubt that amongst the Romans it was considered as valuable, or nearly so, as the genuine stone. We thus, therefore, thank the spirit of deception, it would appear, for the first attempt at colouring glass, which, fortunately for the scientific world in these days, is not the usual incentive to invention. Many eminent Germans brought the several processes nearer to our own time, and recently, in our own country, patents have been obtained for its more extended adaptation, in the shape of coldmns and bars, from which it is more likely to become of universal use. The many modes in which it may be adapted to the internal fitting and decoration of palutial and first-class residences, may be evidenced by the present use, though not as yet carried out extensively, in shop window-fronts in many of the leading towns and cities of Great Britain and Ireland. For stair-balusters, and even hand-rails, arranged as pilasters for mantle-pieces, ceiling-centres, as mirror-frames, curtain-bars. Then again for furniture, as the legs of couches, table-pedestals, &c. We will not go so far as to advocate the "glass stairs" of the nursery-tale, down which the ambitious fair one is reported to have broken her leg, substituting for which a golden one, and dying, makes a journey from the tomb to demand the golden limb from her husband, who had no idea of burying such a valuable article; but such things may be realized, unlikely though it appears. The use of coloured or colourless glass in all places where convenient would add much to the beauty and airy effect of a mansion.

In our cathedrals and churches, instead of dividing stained windows by mullions of stone or brick, it may be done by strong ones of coloured glass, the whole then presenting a greater mass of colour to the eye, and so condensing the subject as to produce one grand pictorial effect. The font, the pulpit, may be surrounded by pillars of glass, which may, perhaps, be colourless (but this depending on the adjacent material), as typical of the purity and brightness of the religion to which they are consecrated. To quote the many instances in which it would be found both useful and ornamental may be deemed on our part speculative, in the absence of examples; but it is easy to imagine the effect of its introduction. No gilding or painting would be required to give colour, that being already done, and the effect produced according to the peculiar colour chosen. For lightness of appearance, possessing at the same time a tolerable amount of strength—*i.e.*, resistance to vertical pressure—it can really be commended. Heat and cold, coupled with the settlement of adjacent material, may be deemed an objection to its use; but when placed in a position unaffected by settlement, the objection, of course, is obviated. As far as the change of temperature is concerned, the extensive use of plate-glass windows, as at present, would at one time have been deemed impossible; but prejudices rise only to be exploded—all are dissipated by experiment.

The encouragement of the present use of glass columns and sash-bars for shop fronts should be exceedingly conditional, on account of the necessary superstructure, being sometimes placed in such a position and in such a manner as to be exposed to a strain they are not calculated to bear. In such instances supports of iron, it is true, are provided; but we would suggest thicker columns than are at present used, which would save the expense of so much metal, and look clearer and more complete. Everything should be done very carefully, as this kind of property gives no warning of breakage. Nevertheless, in many instances, when properly fitted and fixed, it is really wonderful what a pressure glass will sustain. Its crystalline structure encourages us in the belief, that should a series of proper experiments be made on columns of glass and bars of the same, of various diameters, they would be found to surpass the strength generally attributed to them, the only danger being where it should be necessary to fix one piece on the top of another, that they would chip off the adjoining edges—this might be prevented by ferrules. However, we are not now necessarily treating of their strength, but of their ornamental uses generally. In regard to these, the variety of form and colour of which it is susceptible gives coloured glass amongst materials, if not the first, at least a very superior rank For grace or boldness of effect, when combined with brilliant or mellowed tints, for sun-light or gas-light, it is certainly a most manageable article, and the ease with which it may be kept clean, together with its preservation of freshness in appearance, are not among the least of its good qualities. We conceive there may be a wholesome dread of its proverbial brittleness, which may alarm the "routine" builder, who naturally enough will hesitate over a new idea. But, before building a palatial or first class residence, a church or a public building, it is well worth while making a few experiments, and we doubt not they would prove successful. A very little artistic taste in arranging and adapting would be sufficient. Suites of rooms, for instance, for balls and evening parties may soon be made to present, in conjunction with mirrors, and at a trifling expense, brilliant and charming pictures, and each bright and particular star amongst our female aristocracy look still more beautiful for the reflection. With some little exercise of taste, we may produce, without the barbarity of profusion, such effects as may rival the much talked-of eastern magnificence.

Here is a hint then; it is quite practical. Let the architect take it; he may often have dreamed of it, and in a small way executed it. It is worth thinking of, and carrying out *in extenso*.

LAW NOTES.—BUILDING QUESTIONS.

Exchequer Nisi Prius.

(Before the Lord Chief Baron and a special jury.)

O'Reilly v. *Brennan.*—Action to recover £431, for building materials furnished. The jury returned a verdict for the defendant, finding that the entire of plaintiff's credits amounted to £1,928, and that the defendant was entitled, as against that sum by payments and goods supplied, to £1,945.

Court of Common Pleas.

(Before the Lord Chief Justice and a special jury.)

Doran v. *Hughes*—Action brought by a shopkeeper in Dorset-street, for injuries alleged to have been done to his house, 143, in July last, when taking down the house adjoining. The plaintiff alleged that, in consequence of the unskilful manner in which the work was executed, his house received such injuries as to cause the glass in the windows to break and the walls to crack. The defence was a traverse of the allegation that the work was executed in an unskilful manner, and the plaintiff's witnesses were cross-examined for the purpose of showing that the house was a very old one, and in a very bad state of repair. This case resulted in a verdict for plaintiff, £75 damages and 6d. costs.

Counsel for the plaintiff—Mr. Sergeant Fitzgibbon and Mr. Sidney; Attorney Mr. Casey. For the defendant—Mr. Armstrong, Q C, Mr. James Kernan, Q.C.; and Mr. O'Loghlen; Attorneys—Messrs. Kernan and Treacy.

Burke v. *Carroll.*—We understand that this record is for the *present* withdrawn.

Kelly v. *Crampton.*—This case will not come on till next term.

Lord Gough v. *Carmichael.*—This action, instituted for alleged breach of duty as an architect, was—after being partly proceeded with—referred to the Master of the Court, to be assisted by an architect.

Kelly v. Hoey.—Action by Mr. Patrick Kelly, a builder, against Mr. Robert Hoey, of Kilmacud, in the County Dublin, to recover £130, for work and labour, &c., as a builder. The defences were, that the work done was fully and sufficiently paid for, and that some of the work was not done in a proper and workmanlike manner, &c.

Sergeant Fitzgibbon, with Messrs. Burke, Q C, and W. Burke, appeared for the plaintiff; and Messrs. Rollestone, Q.C., Barry, Q.C., and Heron for the defendant.

The case of the plaintiff was, that he entered into a contract with the defendant to do certain work for £380, according to plans and specifications prepared by Messrs. Carmichael and Jones, architects employed by Mr. Hoey; that after commencing the work the original plans were departed from, and considerable expenses incurred, part of which were paid, leaving altogether a sum of £130 due. Plaintiff alleged that an ornamental tower was erected on an old foundation, to a height of 50 feet, contrary to his opinion and advice, and that it fell, as he anticipated, and that the amount claimed included the cost of removing the materials of this erection. Defendant replied that the plaintiff's charges were exorbitant, and that the work and materials were not according to the terms of the contract; and that the sums paid on foot of contract, and extra work, was fully what the work was worth, if not more.

The case resulted in a reference to the Master, to take an account between the parties to be assisted by an architect.

Kempston v. *Butler*. This case was partly tried previously, when the plaintiff was nonsuited on a technicality. Action brought by Mr. John Kempston, of No. 82 Grafton-street, against Mr. John Butler, of Rathmines, a builder, for alleged damages, for negligence in taking down adjoining house in November and December, 1858, for the purpose of rebuilding same. The summons and plaint charged defendant with negligence, by reason of which plaintiff's house fell; and stated that Mr. Kempston's house was entitled to lateral support from adjoining house, No. 83, and that defendant, having improperly removed that house, was liable to make good plaintiff's loss. There were also counts for breaking into plaintiff's house and injuring his goods, &c. Defendant traversed all these allegations, and pleaded that plaintiff's goods were encumbering his close, and he took them away, and was justified in so doing, &c. Damages laid at £7,000. The house formerly belonged for some years to Mr. O'Reilly, ladies' mourning outfitter, and up to March, 1858, when he sold his interest in the house and business to the plaintiff for £500, for the residue of a term of 61 years, subject to £95 annually. Mr. O'Reilly expended about £400 on the premises in certain building alterations, according to plans, specifications, and under superintendence of Mr. Caldbeck, architect, and executed by Mr. James Donnelly, builder, in the year 1856, and previous to disposing of them to plaintiff, who also expended £150 additional, and continued to carry on same business, alleged to be a profitable one. No 83 was in March, 1858, the property of Mr. Thomas Ferguson, of the Four Courts, who shortly afterwards let it on lease to Mr. Falkner, of Grafton-street, who employed defendant to rebuild it upon a more extensive scale. Defendant proceeded to take down No. 83 in November, 1858; but the case of plaintiff was, that having neglected to prop or shore up No. 82, as he was bound to do, that house fell in the month of January, by which he lost a considerable amount of property, &c. The amount claimed for rebuilding was £975, and £6,025 for the injury alleged to be sustained by the loss of business and the value of the goods destroyed and damaged. The proceedings in the former action were abandoned, and in the renewal pleadings it was alleged that the wall in question was a party wall. Defendant replied it was *not* a party wall.

On behalf of plaintiff the following witnesses were examined:—viz., the plaintiff himself, Mr. Hipwell, Mr. Flynn (his manager); Messrs. Louch, J. S. Butler, J. J. Lyons, and Courtenay, architects; Messrs. James Donnelly, Timothy Murphy, John Nolan (Meredyth-place), Michael Dunne, Henry Allen, and Alexander Graham, builders; and Miss Mary Bagnall, wareroom-keeper. On behalf of defendant—the defendant personally; Sir Thomas Deane, Messrs. Jacob Owen, G. Wilkinson, and E. H. Carson, architects; Benjamin Norwood and S. Leech, builders; James Toole (foreman), Doyle, Murphy, Lalor, Bacon, O'Brien, and Finney, workmen.

John Augustus Kempston—Is plaintiff in the present action; recollects when defendant commenced taking down the house, 83; defendant did so without giving him any notice whatsoever of his intentions; nor was he (plaintiff) aware of the nature of the contemplated works, until defendant, by introduction of Mr. Hipwell, of No. 84, called on him (plaintiff) during the first week of the operations, and then first apprized him verbally of the intended rebuilding of No. 83; defendant advised plaintiff to allow him to take down a portion of the divisional wall which remained after the outbuildings of 83 were removed, in which plaintiff acquiesced; plaintiff frequently drew defendant's attention to the apparently increasing dangerous state of his house, to which defendant replied that he would make it all right, and that he (plaintiff) need not be uneasy; these promises were repeated in the presence of plaintiff's wife, his manager, and Mr. Hipwell; previous to removal of 83 plaintiff never observed any cause for apprehension; on the Monday week before plaintiff's house fell, he (plaintiff) brought defendant up to the top back room, and drew his attention to the crack between flank and rere walls, and defendant undertook to have additional struts put thereto; on the Monday previous to the fall, plaintiff called on his acquaintance, Mr. Michael Dunne, a builder, who, after examining the premises, told plaintiff the house was in a very dangerous state, and as defendant had several workmen shoring up 82 interiorly at that time, and, as he was a respectable man, and in his (Dunne's) opinion knew his business, he declined to interfere; plaintiff told defendant result of interview, but defendant again assured him he would leave nothing undone to protect his house, and remained on the premises three hours directing his workmen; defendant had workmen at the house, 82, every day up to a few minutes before it fell; plaintiff deposed to the particulars of his interest in the premises, the extent of the injuries, and substantially to the value of the property, &c, &c., as stated in the first paragraph.

Plaintiff was cross-examined at considerable length, but no material deviation from the above was elicited.

Mr. Hipwell, Mr. Flynn, and plaintiff's wife corroborated the statements of plaintiff.

Mr. Michael Dunne—Knew the house and premises since 1834, when he was engaged in alterations there; subsequently, in July, 1858, executed some jobbing works for plaintiff; was called on by plaintiff on 24th January, 1859, examined the premises, told plaintiff they were in a very dangerous state; saw defendant and his several workmen setting up shoring in the shop, 82; told plaintiff defendant was a respectable man, believed he understood his business, and he (witness) did not wish to interfere; called on Thursday, 27th, went on the roof of 82, saw a number of defendant's workmen on a scaffold taking down the chimneys, when he detected the dangerous state of the flank wall, heard cracking, and begged of all hands to quit for their lives; was outside the door about two or three minutes when the house fell; proved the custom of builders in Dublin to brace and sustain adjoining houses, independent of special instructions.

James Donnelly, builder—Knew the premises in question; was engaged at the taking down of old front and the rebuilding of a new front in 1834, and again made certain alterations in 1856, under Mr. Caldbeck, an architect; believed the premises to be at that time in a substantial condition; that the alterations made by him did not affect their stability, but the contrary; that it is the invariable and customary duty of builders effecting rebuilding works to shore up sufficiently, according to circumstances, adjoining houses, and protect them from injury or downfall; that they are held to be responsible for accidents arising from want of precaution; that it is the custom of Dublin architects to put such a proviso in the specification, but that whether or not, the builder has a right to look to it, as he includes the cost in his estimate, and is paid by his employer; the scaffolding poles used were not suitable for shoring or bracing, only averaging 5 inches diameter; the struts between 82 and 84, after 83 was being removed, were placed in an unworkmanlike and incompetent manner; diagonal ties were necessary; the struts and braces between houses 82 and 84 should have been set before a brick of 83 was disturbed; defendant began at wrong end—first took down the storey and then set the struts; believed the bricks in the divisional wall to be quite as good as those in the new club-house at Kildare street. and exactly the same quality; that if bracing and strutting had been properly done, house 82 would still be standing, and likely to do so for many years. Witness entered into a lengthened explanation, at request of judge and jury, of how, in his opinion, the bracing and strutting should have been executed, and in reply stated, that a builder's first duty would be to examine the adjoining houses; would ask permission from the proprietors to take the necessary steps in trussing, bracing, and strutting, and that if refused would apply to the corporate officer for authority; would set long planks from bottom to top as vertical pieces against the flanks, and support the beams, struts, &c., tighten them with wedges between the joists, or as near as possible thereto, of adjoining houses; would stiffen the struts by diagonal braces.

Cross-examined by Mr. Brereton, Q.C., but the witness persisted in his previous statements.

Mr. John Nolan, of 25 years' experience, proved that it was invariably the custom and the recognised duty of the trade in such cases to prop up effectually adjoining premises, and that the necessary precautions depended on the character of the work; would not experience any difficulty in such a case; if the clause were omitted in the specification, it would surely be provided for in the estimate, and included in the contract.

Henry Allen, builder—Saw the premises 83 in January, 1859, and from the manner 82 and 84 were strutted, expected the house 82 should fall; deposed to the custom of the trade from 40 years' experience.

Cross-examined Mr. Fitzgibbon, Q.C.—Stated that poles used were insufficient for struts, and the vertical pieces too short; struts should be 9 inches by 6 inches.

Alexander Graham, builder, of 15 years' experience—Passed the place frequently; concluded it would fall; timber for struts should be 7 inches by 6 inches; no diagonal or spur braces.

Cross-examined by Mr. Macdonogh, Q.C.—Admitted he never served his time, and that there was an architect—denominated by the counsel "a naughty man"—called in to examine his work at Bidgood and Reside's, who directed an abutment to be built, for further security to their premises; but has since executed, under the same architect, several extensive works.

Mr. John Louch, an architect of 40 years' experience—Has executed extensive works in Dublin and various parts; proved adjoining houses were invariably braced and maintained at cost of the proprietor of the premises about to be rebuilt; the insufficiency of the struts used; examined the premises, 82, after the fall, in company with Mr. J. S. Butler, architect, and James Donnelly; compared the model exhibited to the court and believed it correct.

On cross-examination—Was not aware of a custom involving a builder in responsibility, but believed same, if any, to devolve on the employer.

Mr. F. W. Courtenay, architect, deposed to the custom and to the insufficiency of the precautions taken by defendant.

Mr. J. J. Lyons, architect, deposed that eleven years ago he was employed by Mr. Thomas Ferguson, landlord of 83, to cause to be taken down, by Mr. James Dwyer, builder, a portion of the divisional wall next 82, together with other requisite repairs; that some three square yards of brick-work were removed under his directions, notwithstanding apprehensions expressed by the proprietor as to the safety of said wall; that his services were gratuitous, and that the locality in which said repairs were effected were immediately under the front stack of chimneys.

This closed the evidence of plaintiff.*

Counsel for plaintiff—Sergeant O'Hagan, Q.C. (now Solicitor-General), Mr. Armstrong, Q.C., Dr. Denis Caulfield Heron; for defendant—Messrs. Fitzgibbon, Macdonogh, and Brereton, Q.C's., Exham and Osborne.

The Committee of Agriculture of the Royal Dublin Society advertised last month for designs for two prize cups, of the respective values of £125 and £50; and we understand that various suggestions were submitted, and that those accepted will prove a decided improvement on the previous designs.

Clarkson Stanfield, R.A., is painting a grand view of the Bay of Naples, taken from St. Elmo, looking over the port and bay, past Torre del' Greco, up the slope of Mount Vesuvius.

RATHGAR PRESBYTERIAN CHURCH COMPETITION.

THIRTEEN sets of plans have been submitted in competition for this church, in answer to public advertisement, dated 4th January, by the following authors, viz.: Messrs. Heiton, of Perth, Dewar, of Glasgow, Duncan Ferguson, E. P. Gribbon, Courtenay, Moyers, M. Moran, Raffles *Brown*, Carmichael and *Jones*, *Smith* and *Robinson*—all of whom, we believe, are practising architects—Meade, builder, and Fyffe, an *attorney* (which, however, we learn was only in trust for an architect). We are informed that at the first sitting of the judges all the designs submitted by *resident* architects, except that of Mr. Gribbon, were rejected; that his plan and those of the two Scotch architects, viz., Messrs. Heiton and Dewar, were retained for final decision; and that at the second sitting Mr. Dewar's plan was cast, and the result consequently left between Mr. Heiton and Mr. Gribbon, who will probably be joint architects of the structure, The committee generally are in favour of the *exterior* of Mr. Gribbon's design, and the *internal* arrangements of Mr. Heiton's. Whatever may be the secret interested workings *usual* in competition matters, we feel assured that in *this* instance there is a guarantee that nothing but merit will prevail, by the names of the gentlemen principally associated with the undertaking, who are some of the most respectable and responsible in Dublin, viz.: Messrs. Thomas Drury, J.P.; David Drummond, of Dawson-street, and Stirling; Robert Bell, of Scott, Bell, & Co.'s; Hugh Moore, Cremorne, Rathgar; and Henry Richardson, Court of Probate. This committee doubtless bear in mind, that they are constituted judges between man and man, that they represent the interests of the numerous body of contributors to the building as well as their own, and that they are bound both morally and virtually to adhere rigorously to the conditions stated in their advertisement and instructions, as regards limit of *time*, proposed *expenditure*, and accommodation. All these are important, as a competition may be compared to a lottery, every competitor being like a ticket holder, paying for his *chance* of the prize on the *faith* of a stipulation; and there should not be a fresh issue at the eleventh hour, else disappointed competitors, believing themselves led astray, *may*, by demands for redress—and probably with reason—cause embarrassment. The ordinary business of an architect's office is not competition, but works of every-day practice, leaving little time for speculation, though in some instances *bona fide* engagements are neglected to pursue what eventually results in a *will o' the wisp* infatuation. We are induced to offer these remarks more as suggestions to, than reflections on the purpose of, the committee, without assuming that there is a special necessity for them.

SCOTCH CRITICISMS ON DUBLIN PAROCHIAL CHURCHES.

THE *Glasgow Citizen*, in alluding to the recent destruction by fire of St. Andrew's Church, is *pleased* to say: "Like *all* the parish churches of Dublin, St. Andrew had *no claims to architectural beauty*, but was *rather* a substantial and commodious pile, with a *vast deal* of woodwork in the interior."

What a wholesale condemnation of *all* our parish churches! What a stupid perversion of fact, both as regards St. Andrew's and other churches! What of George's, for example? An insignificant production, no doubt, quoth our Caledonian critic. Is there any church in Glasgow with one-half the merit of either, ask we?

We hope to be able by an *illustration* of the interior of Andrew's to enlighten our cotemporary about this "*substantial*" and "*commodious*" structure, with its "*vast deal of woodwork;*" for evidently the writer has hazarded an opinion guided by national prejudice, and without seeing the buildings *at all*, or, having seen them, is not *competent* to form one.

With reference to the same church, a correspondent of *Saunders' Newsletter* writes: "As there is some chance that the above church will soon be rebuilt, it would be well if the present opportunity were taken of effecting some alteration in its form and position. It has always been objected to the old church, that internally it was arranged *in violation of all principles of auscultation*, while externally it had the appearance of a large mausoleum *flung into the middle of the street*. Leaving the internal arrangements in the hands of *those for whose convenience they may be intended*, there are two points in which the parishioners and the public are greatly concerned—the architectural appearance of the new church and its position. It must be borne in mind that the new building is intended for one of the most important parts of the city, and for its wealthiest parish, and that it is to be erected in an age when the country has risen to a great pitch of wealth and refinement and great taste in sacred edifices, and that therefore any new building of the kind should be elegant and worthy of the occasion. But the site must be altered. The building should be thrown back at least fifty feet; the churchyard wall must be thrown back also, and railed off; and the grounds should be laid out in plantations. These improvements must be at the joint expense of the Ecclesiastical Commissioners and of the parish, but the Corporation should lend a hand. and every interest should be brought to bear on so important a point.

---

* The defendant's evidence and judge's charge will be given in full in our April No.

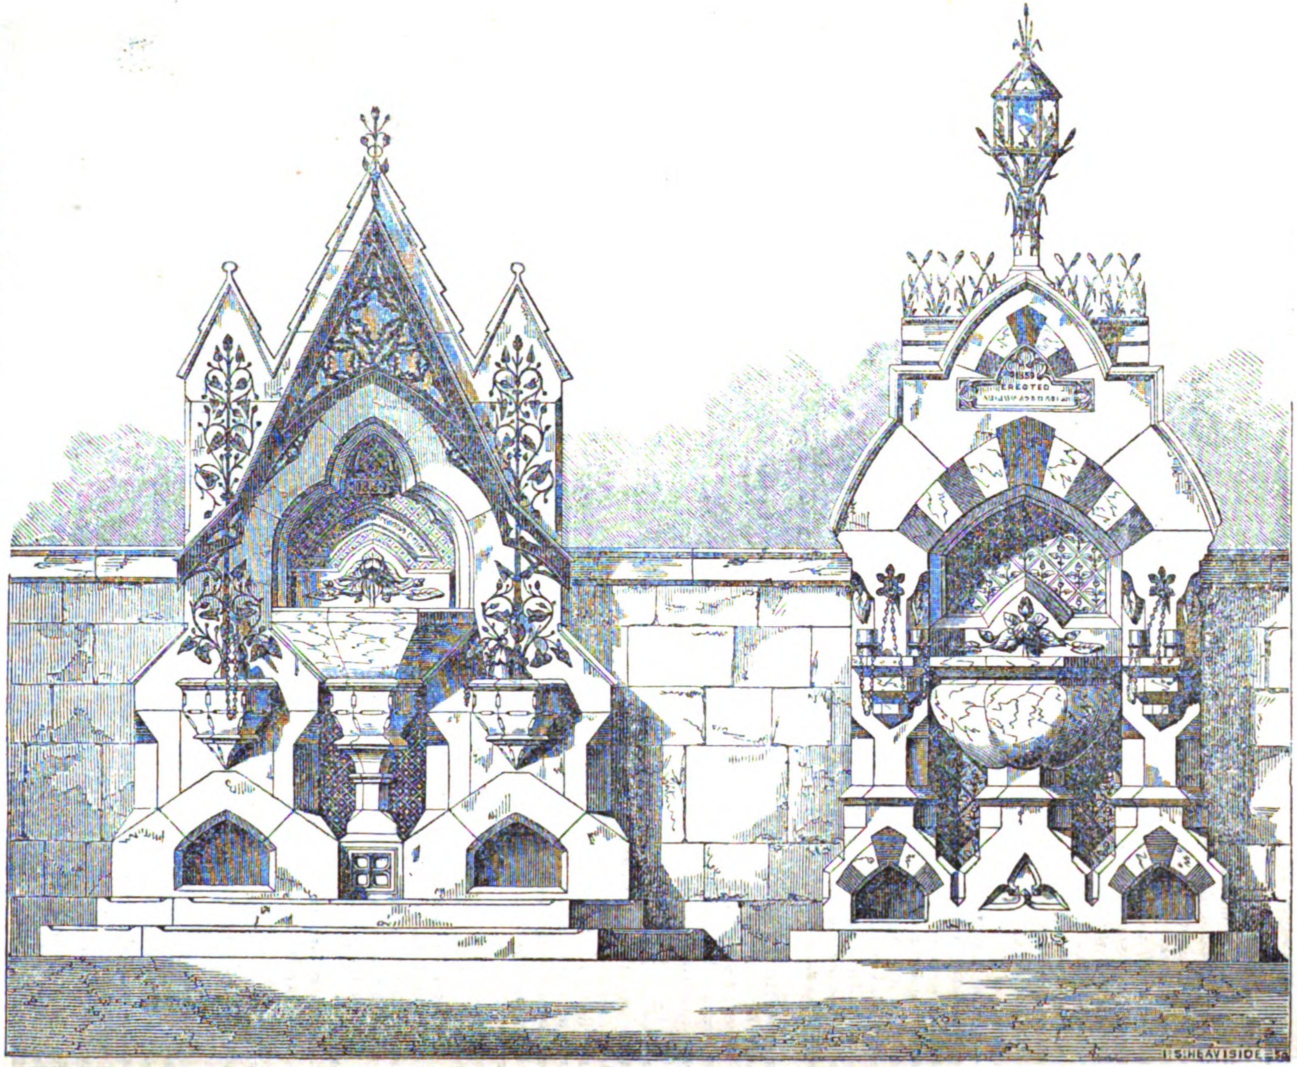
DESIGNS FOR DRINKING FOUNTAINS.

So much interest is felt in the drinking fountain movement that we have arranged to present our readers this month with illustrations of what *may*, and also what *has* been done to combine philanthropy and *art* in such structures, though we cannot as yet congratulate our fellow-citizens upon a skilful development of the artistic element in any placed in *this* metropolis.

The designs on this page are for mural fountains, in the mediæval style of architecture, and intended to be constructed of more permanent materials than those usually adopted. They are by Mr. Henry Godwin, architect, of Alexander-square, Brompton, and though previously appearing in the *Builder*, we republish them for those of our readers who may not have had access to that periodical, being enabled to do so through the courtesy of the editor. The following is a brief description of the general design:—

No. 1 shows the top of the brackets for the cups, of white marble, with the basin supported by a Bath stone pedestal. Dog-troughs below, as in the other, are in the face of the erection. A metal hood is introduced, supported by ornamental foliated metal brackets, which are continued up against the face of the stonework, tending to give additional support to the projecting hood, and rendering the design more complete. The cups are to be suspended from the brackets by slight chains. The whole is raised on two steps, the arrises of which are rounded off. The Bath stone would be indurated, to resist the action of the weather.

No. 2 is intended to have the voussoirs to the arches alternately of white and red marble; the basin which stands in the arched recess is of white marble; as also are the brackets on either side for the cups; the back of the recess to be faced with tiles having a pattern of some water-plant in blue upon a white ground. Two recesses for dogs below are proposed, through which the waste water will pass into the drain. Above is a panel for the erector's name, or an inscription. Bullrushes in metal are introduced as a termination to the stonework, with an octagon lamp surmounting the whole, supported by the same plant symbolical of fresh water.



No. 1. No. 2.

DESIGNS FOR MURAL DRINKING FOUNTAINS.—MR. HENRY GODWIN, ARCHITECT.

THE WATER SUPPLY OF DUBLIN.[*]

STILL this vexed question drags its slow length lazily along! still wars and rumours of wars prevail in the opposition camp! still meetings are organized, long speeches made, figures twisted and tortured in support of various views! and yet withal the subject is turning right back again to the point from which the disputants set out—viz., "the canals." *We* must remind our readers that throughout the series of articles which has appeared in this paper—the *only* one that devoted space freely, impartially, and systematically to the various details and phases of this important question—we unflinchingly advocated the canals as the *best*, *cheapest*, and most *natural* source for pure and wholesome water to our city; and though for a time we *did* feel that the canal companies exhibited a disposition to steal a march upon the citizens, and place the Corporation in an inextricable fix, we nevertheless hail with much pleasure the apparent probability of "a declaration of peace" on mutually satisfactory terms.

That the constitution of the bill, and the energetic manner in which it was pushed through its various stages up to the point of its second reading, has served to bring about this result, and awaken the canal companies to a sense of their duty, is certain; whether or not it was *intended* as such—and such only—from the onset, is another question, upon which we do not pronounce an opinion. We have no desire to go over a long story again, indeed from what we learn, the citizens think there has been quite enough of *talk* in all quarters, and that some definite course should be forthwith decided and acted upon. If, however, the contract be concluded with the canal companies for a guaranteed supply of *ten million* gallons per diem, for £4,000 per annum, which, after all, is only some £1,600 additional annually on the citizens, and that the arrangement be perfected beyond the possibility of doubt or contraversion hereafter, we must ask why should the "Coyford" supply bill be proceeded with in the teeth of opposition, and under the expense consequent upon it? The guarantee of the canal companies for an "unincumbered supply," and to take upon themselves the *onus* of giving compensation to millers or others having rights in connection with the canals, appears to our mind a perfect solution in the abstract of all the difficulties that beset the question up to the present, with the single exception of the cost of reservoirs, filtering-beds, &c. Who is to pay for them? is easily answered—of course, the ratepayers; but what will they cost?

For this and other information we await the report of the SPECIAL WATER WORKS Committee, to whom the proposition of the canal companies has been referred, and we sincerely trust that the question may be speedily solved, and the citizens secured permanently the advantages of water pure and in abundance.

[Since writing the above, we notice a requisition signed by numerous members of the municipal body, calling on the Lord Mayor to convene a meeting of the citizens to discuss the question, and which was accordingly done for the 28th ult., to be holden in the Round Room of the Mansion House. We wish, for the impartial solution of the problem, the requisition bore a more *general* and less *party* aspect.]

ANCIENT BRISTOL.
